HEADQUARTERS
THIRD UNITED STATES ARMY
G-5 Section

APO 403

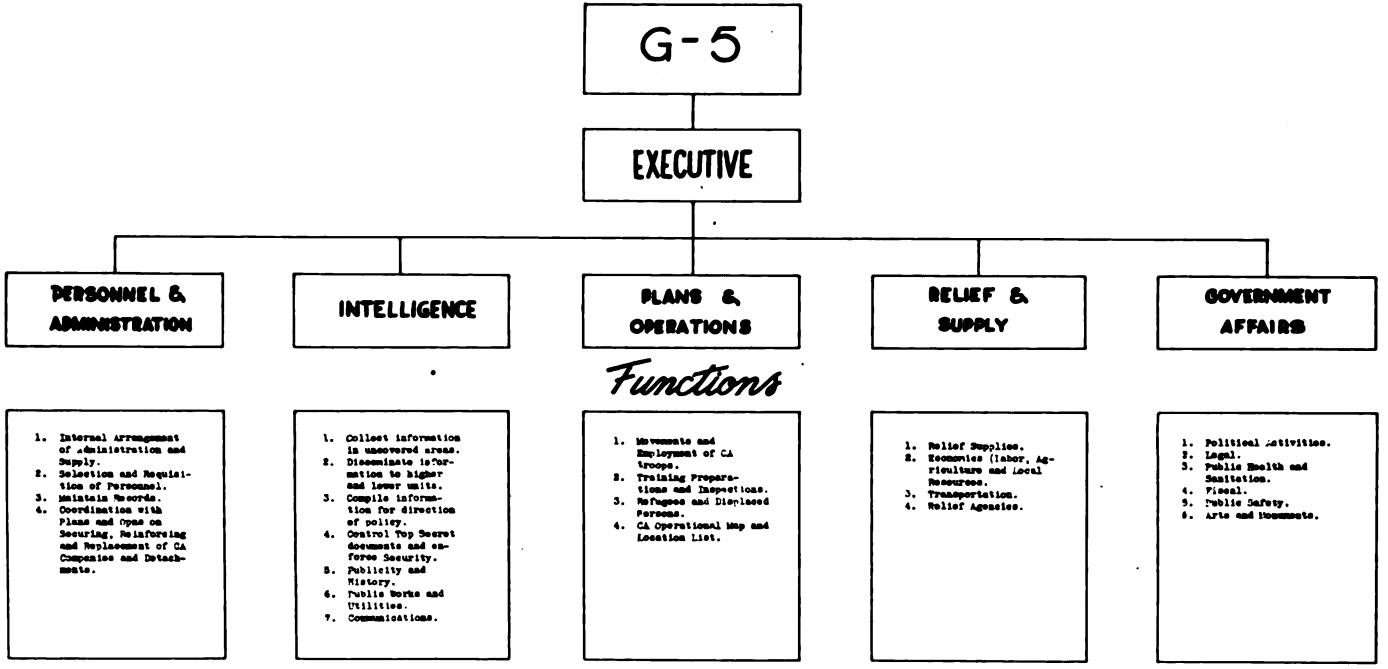
SUBJECT: After-Action Report, G-5 Section, Third U.S. Army.

TO : Commanding General, Third U.S. Army.

Submitted herewith is the After-Action Report of G-5 Section, Third U.S. Army Headquarters, beginning with its establishment as a General Staff section, 22 April 1944, and continuing at the properly designated intervals by chapters.

The mission of this Section as set forth in Memorandum Number 2, this Headquarters, 26 April 1944, was "to further military objectives." This involved a thorough control of the civil population and an employment of civilian resources in the common aim of destroying the enemy.

Success in accomplishing this mission is the result of the complete cooperation of all sections of the Army, its corps and divisions, the whole-hearted assistance of the peoples of the liberated countries and the strict enforcement of regulations prescribed for Military Government in GERMANY.



ROY L. DALFERES
Colonel, G.S.C.
Ass't Chief of Staff, G-5

DECLASSIFIED

G-5 SECTION

Organizational and Functional Chart

In 1940, masses of bewildered refugees blocking military roads disrupted Allied defense plans, hampered troops commanders and contributed to the public hysteria which hastened the collapse of BELGIUM and then FRANCE. In SICILY and ITALY, the Germans drove civilians

placed persons, possibly numbering many thousands in the course of the Army's advance, were to be so controlled as to avoid

Digitized by Google

Higher military authorities in WASHINGTON and LONDON had been preparing for Civil Affairs for the greater part of two years. Training schools in military government were in operation both in UNITED STATES and ENGLAND. Officers attending these schools had been selected because of their knowledge of FRANCE and its peoples, and their previous professional, business and governmental experience. Many were veterans of the First World War. Some had served with the Army of Occupation in GERMANY a quarter century earlier.

G-5 staffs were already functioning at Supreme Headquarters and at Headquarters, First U.S. Army Group. The European Civil Affairs Division had been organized and trained with an approximate strength of 1,200 officers and men, and assigned to Headquarters, European Theater of Operations.

Moreover, actual field experience of invaluable character had been gained by the operations of Allied Military Government of Occupied Territories (AMGOT) in the African, Sicilian and Italian campaigns. The new conception of Civil Affairs as an organic army service, supervised by Army, Corps and Division staff sections, was largely a result of this recent experience of AMGOT.

Organized on the conventional pattern of regiments and companies, the European Civil Affairs Division's basic field unit was the Civil Affairs Detachment. This was really a civil administrative team. Four types of Detachments were provided:

Type "A", with a strength of seventeen officers, two warrant officers and twenty-two enlisted men, was equipped for work in larger cities and on higher governmental levels, such as Regions or Provinces. It had specialists in police work and public health, fiscal experts and engineers, sanitary officers and lawyers.

Type "B", with nine officers, two warrant officers, and sixteen enlisted men, was for employment in the next lower grade of cities and governmental units.

Type "C", with five officers and nine enlisted men, and Type "D", of four officers and six enlisted men, were to supervise towns and villages -- often, in practice, as many as twenty small communities in a single jurisdiction.

Small reserves of specialists were held for emergencies at Regimental and Company headquarters, which otherwise were to function strictly as administrative units; and in each regiment one company, with a pool of forty specialist officers, was organized to serve as an Army Reserve.

The plan contemplated an equal division of the Detachment commissioned personnel between the British and United States forces. Army, Corps and Division staffs, however, were to be exclusively of the nationality of the flag under which they served.

In addition to recruiting its own staff, Army G-5 was charged with selecting the personnel for Corps and Division staffs. These totalled sixty-four officers. So far as possible, officers with prior military service were selected. Corps and Division Commanders were given the choice of appointing staff officers from their own rosters, but only seven officers were so named by Division Commanders, none by Corps Commanders. The care employed in the selection of these staffs by Army G-5, and the calibre of the officers assigned was later given striking evidence in FRANCE by the work accomplished.

Organization, training and planning were necessarily paralleling activities of Civil Affairs during this preparational phase in the UNITED KINGDOM. The exact character of the work to be done on the Continent was dependent upon the outcome of prolonged secret negotiations on the highest governmental levels. These extended through the Spring. The decision finally reached was that any semblance of military government in FRANCE would be scrupulously avoided, that the French would resume full civil authority as rapidly as conditions permitted.

Coincident with its organization, the G-5 Section had to plan for the employment of four companies and a platoon of Civil Affairs troops aggregating some 1,200 officers and men, coordinate these plans with those of other staff sections of the army, and at the same time effect fundamental changes in a program that had been the basis of all Civil Affairs training up to that time.

By 14 June, most of the changes were incorporated in a series of eighteen Instructional Guides covering as many subjects of French civil administration. Two further guides were published by the month's end, making twenty in all. These guides were to be the Bible of all Civil Affairs operations in FRANCE.

SECTION II

PERSONNEL AND ADMINISTRATION

The [illegible] Administration Branch, being the first sub-section [illegible] the G-5 Section, commenced operations early in April.

Three officers and six enlisted men then composed the entire G-5 Section staff. Acquisition of competent officer and enlisted personnel proved to be a problem because of the lack of an approved Table of Organization until 21 May. Immediate steps were taken to have competent officer and trained enlisted personnel assigned to the section. Journeys were made to European Civil Affairs Division for the selection of officer personnel, and requisitions were submitted for trained enlisted personnel. Table of Organization authorized the assignment of many specialists, but it was soon apparent that trained personnel such as interpreters, sanitary technicians, etc., were not available in required quantities.

All officer personnel for Corps and Division Staffs were cleared through Army prior to reporting to their respective assignments. Enlisted personnel for Corps and Division Staffs were sent direct from European Civil Affairs Division to proper station.

Approved Table of Equipment was unavailable and had to be processed. G-5 was to operate as a self-sufficient unit and additional equipment was eventually made available. Table of Organization, however, was not increased and drivers and cooks had to be carried within Table of Organization without special allowances being made. Housekeeping and guard details necessarily had to be carried on by strength authorized.

Pre-operational phase of Civil Affairs involved establishing and filling Tables of Organization and Equipment for Corps and Division Staffs, the preparation and circulation of Instructional Guides, Directives, Bulletins, Memoranda, etc. The internal administration and training of enlisted personnel became a large problem because specialists were not Army trained but were selected by reason of civilian experience.

SECTION III

INTELLIGENCE

G-5 Intelligence was charged with the following missions:

1. To collect information on civilian conditions in uncovered areas and disseminate it to higher and lower units.

2. To compile information for the direction of policy.

3. To compile historical reports.

4. To maintain liaison with the AC of S, G-2, Counter-Intelligence Section, G-2, and Lower Civil Affairs staff sections.

5. To control Top Secret Documents and enforce security regulations.

By 6 May, a definite understanding was reached with Counter-Intelligence Section, G-2, on cooperative methods to be followed by Civil Affairs Detachments and Counter-Intelligence Corps teams in the field. Among other things, it was agreed that Detachments would be notified by Counter-Intelligence Corps in advance of any proposed arrests of local officials and [illegible] useful to Civil Affairs. An understanding was also reached with the Provost Marshal covering dual interests in handling refugees and displaced persons, and in the issuing of civilian passes in liberated areas.

Through cooperation of the AC of S, G-2, intelligence was gathered on civilian problems and attitudes in FRANCE, emphasizing evacuations of civilians that had already taken place, German stripping of French coastal area resources, and likely concentration points where civilian masses might be employed by the enemy to impede the Army's movements.

The first draft-form Civil Affairs Annex Number 10 to the Third U.S. Army's Administrative Order for the OVERLORD operation was written. Upon receipt, early in June, of an advance copy of the new "SHAEF Field Handbook of Civil Affairs, FRANCE," (Provisional First Edition), the Annex was redrafted, and coordinated with other staff sections.

Liaison with the Civil Affairs Section, First U.S. Army and with G-5 Section, First U.S. Army Group was effected 15-18 May.

Civil Affairs Bulletin Number 1 was issued on 22 May as the first of a series. An instruction to all Civil Affairs officers and men, "Intelligence in the Field," was prepared in coordination with the AC of S, G-2.

Coordinating meetings were attended in LONDON, 30 May, with G-5 representatives of First U.S. Army Group, of Headquarters, European Theater of Operations, and Forward Echelon, Communications Zone, And on 31 May with officers of the U.S. Navy Task Force Support Group.

The Branch on 31 May had in charge 291 Top Secret and Top Secret Bigot documents, fully registered and catalogued. A library of approximately 1,000 maps and 700 classified documents for reference purposes had been assembled.

The Branch Chief addressed the 5 June sessions of Counter-Intelligence Corps, Third U.S. Army, at which more than 100 members of Counter-Intelligence Corps from Corps and Divisional Teams were present. Subsequent conferences developed plans for coordinated operations. These plans were later formalized by specific G-2 directives to Counter-Intelligence Corps, and by G-5 Intelligence instructions. They became the bases of paralleling operations in the field.

SECTION IV

PLANS AND OPERATIONS

Plans and Operations Branch was initially activated as a coordinating staff branch on the same level with Personnel and Administration, Intelligence and Supply. These four branches had general supervision over eight functional staff sub-sections, namely, Public Health, Relief, Fiscal, Government Affairs, Transportation, Communications, Works and Utilities, Economic Affairs, Information and Public Relations. Shortly before coming to FRANCE, the G-5 Section was reorganized and the Plans and Operations Branch became one of five equal and complete branches, namely, Personnel and Administration, Intelligence, Plans and Operations, Relief and Supply, and Government Affairs. All Civil Affairs functional activities were placed under one of the five branches.

Plans and Operations Branch was made primarily responsible for the internal organization and training of the Section and of Army Civil Affairs Reserves. It was to maintain an operations map, make a continuing study of the tactical situation in so far as it affected Civil Affairs, and prepare plans for and supervise the allocation and movement of Civil Affairs Detachments or units to Corps, in coordination with G-3. The Branch was further made responsible for supervising the functional activities involved in handling displaced persons and refugees.

Initial planning and actions included the preparation of a Civil Affairs Operational Plan and of Standard Operating Procedures for FRANCE, together with the carrying out of training programs for all assigned and attached personnel. Upon request as of 30 May, the following units were attached to Third U.S. Army:

	Personnel	Vehicles
Hq/Hq Det, 2d BCA Regt	113	36
Co A, 2d CA Regt	204	65
Co B, 2d CA Regt	204	65
Co C, 2d CA Regt	204	65
Co D, 2d CA Regt	204	65
Co I, 2d BCA Regt	192	58
2d Plat Transport Co BCAD	76	35
	1197	389

Digitized by Google

One Civil Affairs Company was attached to each Corps as follows:

Unit	Attached to
Co A, 2d BCA Regt	VIII Corps
Co B, 2d BCA Regt	XV Corps
Co C, 2d BCA Regt	XX Corps
Co D, 2d BCA Regt	III Corps

DECLASSIFIED

REFUGEES AND DISPLACED PERSONS

The chief mission of the Refugees and Displaced Persons subsection was to prevent any hindrance to military operations that might be occasioned by the massing of uncontrolled movement of civilians in these categories. It was also [illegible] them which might threaten the [illegible] practicable to relieve their [illegible] an organization to effect [illegible] placed persons, which organization [illegible] course to appropriate authorities.

Steps were initiated to secure information as to the numbers, conditions and locations of refugees and displaced persons which might be encountered in the anticipated Zone of Operations of Third U.S. Army. Concurrences in all instructions were secured from the AC of S, G-5, the Provost Marshal and the Surgeon, and on 14 June an Instructional Guide concerning refugees and displaced persons was issued. This guide aimed at making the greatest possible use of indigenous facilities, agencies and government so as to place the least possible burden on the Army. Preparations were made to cope with refugees and displaced persons in the event that the enemy employed them as an obstruction to the movement of our troops.

Plans contemplated the use of Civil Affairs Detachments as operational troops, with the Army staff acting as a supervisory and coordinating agency. Refugees encountered were to be brought together at Collection points and passed backward through Transit points until finally reaching more permanent facilities known as Assembly Centers. Plans included admonitions against any more movement of civilians than was necessary for security and military freedom. Provisions were made for securing necessary supplies and rations. Two specialist officers from Company I, 2d Civil Affairs Regiment, were specially instructed so that they might be made available to Corps, Divisions and Detachments for supervising an emergency situation in which large concentrations of displaced persons or refugees might be encountered beyond the capacity of operational Detachments.

SECTION V

RELIEF AND SUPPLY

The Operational Supply Branch was activated 20 April. It began at once a study of the Army's part in the civilian relief supply plans prepared by Supreme Headquarters Allied Expeditionary Force for FRANCE during the first 90 days of the operation [illegible]. On 8 May, it was possible to begin coordination of the newly activated operations subsections: Relief Supply, Economics, Agriculture, Labor, Public Welfare, Communications, Transportation and Public Works and Utilities.

Working with the Army G-4 Section, Quartermaster and Medical Supply officer, complete requisitions were prepared for allocations D + 15 to D + 41, for food, clothing, sanitary and medical supplies and forwarded to the Communications Zone, which responsibility it was to meet these requirements available on the continent. About 20 May, allocation of Civil Affairs Relief Supplies were received from First U.S. Army Group for period D + 42 to D + 90.

As all Civil Affairs Relief Supplies were to be handled through the appropriate Army service it was necessary to prepare instructions for the guidance of Civil Affairs Detachments and subordinate staffs. The final draft was approved by the Army services concerned and by G-4 and was issued as "Operational Supply Instruction Number 1" -- with appendices A and B -- showing the flow of Civil Affairs supplies and a brief of the requisitioning procedure.

Conferences were held with First U.S. Army Headquarters and Advance Section Communication Zone on 21 May regarding the policy for requisitioning Civil Affairs supplies from Communications Zone Depots for delivery to the Army Depot.

At 21 Army Group, British, Section representatives met with G-5 Supply Officers representing Supreme Headquarters and First U.S. Army Various conferences of this nature were held during the period 15 May to 15 June to discuss changes in allocations and procedures.

Civil Affairs Annex Number 7 was prepared and after concurrence by G-4, was published in the Third U.S. Army Administrative Order Number 3.

Sub-allocation of credits for Civil Affairs Supplies for period D + 15 to D + 41 were forwarded to Corps 10 June. Sub-allocations for period D + 42 to D + 90 were forwarded to Corps 5 July.

After the operation Supply Instructions were completed and issued, Civil Affairs officers from Corps, Divisions and Detachments were called in to acquaint them with the procedure. A chart was prepared sectioning the flow of relief supplies from the UNITED KINGDOM to foreign shores and to Army depots.

ECONOMICS

The Economics sub-section covered the following fields: Trade and Industry, Labor, Agriculture, Fisheries, Natural Resources, Forests, Price Control and Rationing, Salvage and Animal Health and Hygiene.

Personnel of the section studied available intelligence data on economic conditions in FRANCE. Special reports were prepared which included technical economic maps showing the location of important industries, principal crop areas and natural resources. The structures of the French economic and governmental system were given attention. Indoctrination of Civil Affairs Officers in Corps, Division, and Detachment Staffs was undertaken to acquaint them with the specialized economic work that would be required in the field.

About 8 May, a Labor officer was appointed to assist in procurement of civilian labor for Army use, to establish or reorganize French employment facilities, and to aid in solving labor relating problems in general. A study was made of French labor recruiting facilities and organizations, of price control and of rationing methods and salvage practices.

The French Labor Exchange system was given special study, and plans were formulated to make it more serviceable for the needs of the Army. An essential flaw discovered in the system was that only the unemployed registered, and because of the inability of the persons of re-employment records would prove unreliable. It was recommended that French authorities obtain new labor records at the time ration cards were validated or new cards were issued.

PUBLIC WORKS AND UTILITIES

Major items of preliminary work in preparation for operations consisted of establishing liaison with opposite numbers in the staffs of higher and parallel echelons; publication of Instructional Guides based on directives of Higher Commands; briefing of Civil Affairs officers in lower echelons staffs and in detachments; intensive study of all military intelligence reports covering the areas upon which plans of operation were based.

Briefing of all Civil Affairs officers for the coming operation was accomplished in three phases:

First, those officers designated for staff duties of lower echelons spent several days with the army G-5 staff section interviewing each branch. The Public Works and Utilities sub-section participated, discussing plans and methods for control and operation of technical installations, usually with groups of two to five officers.

Second, officers of the 2d European Civil affairs Regiment designated to participate with the Army in operations were briefed by mentions in their mess halls. Public Works and Utilities utilization plans were outlined at these meetings.

Third, certain officers of the Specialist Reserve Pool of Company I, 2d Civil Affairs Regiment spent several days with the G-5 section studying technical aspects of the planned operation.

TRANSPORTATION

Preparation for operations consisted of establishing liaison with Transportation officers in the staffs of higher and parallel echelons, briefing of the Civil Affairs officers on lower echelon staffs and in the Detachments, and study of all intelligence reports on French areas to be occupied.

COMMUNICATIONS

On the basis of instructions received from First U.S. Army Group and Supreme Headquarters, plans were prepared to meet possible communications problems. Military intelligence reports of the French and German communications systems and German plans for destruction of communications were studied extensively. Liaison was established with Signal Officer and the AC of S, G-2, and their concurrences obtained on all plans for operations.

Since practically none of the Detachments contained technically qualified communications personnel, plans contemplated that the officer in charge of Communications sub-section, assisted by the technically qualified officer from the specialist reserve pool, would enter each liberated city immediately to assist the Detachment to accomplish the mission of this sub section. Constant liaison would also be maintained with Signal officer and G-2 to make certain that French communications workmen and materials were devoted to the most imperative needs of the Army.

PUBLIC WELFARE

Studies were made of areas in which it was anticipated that the Army would operate in FRANCE. From G-2 sources an effort was made to anticipate the extent of destitution in the civilian population that might be encountered and the probable condition of French local and national agencies which would be relied upon to cope with the situation.

SECTION VI

GOVERNMENTAL AFFAIRS

Organized on 4 May, the branch was subdivided into functions as follows: Legal, Police, Fire and Civil Defense, and Displaced Persons. The branch was designed, first, to coordinate the activities of its sub-sections from the standpoint of internal organization and administration, and second, to furnish staff supervision to civilian activities having as their main concern the political functioning of public authorities so far as they affected the Army's interests.

LEGAL

The Legal sub-section started functioning on 6 June and immediately set about drafting its plans for operations in FRANCE. Its Legal Instructional Guide, published after concurrence of the Army Judge Advocate, condensed the policies set forth in the "SHAEF Field Handbook of Civil Affairs -- FRANCE" as to enactments necessary to further the military objectives of the Army, Civil Affairs relationship with the French authorities in restoring the French Courts and judicial system, and observance of judicial proceedings affecting allied interests.

To assist the legal officers in carrying out the responsibility of observing the French methods of administering justice, instructions were given at planned meetings on the organization, jurisdiction, powers and procedure of French Courts. Complete plans were made for the setting up of Allied Military Courts in FRANCE. Both General Military Courts and Summary Military Courts were contemplated to provide, if necessary, for the security of the Allied Forces, the protection of the civil population and the maintenance of law and order.

Orders were received from Supreme Headquarters prior to Embarkation for the continent that military courts would not be established in FRANCE unless directed by higher authority.

Digitized by Google

FINANCIAL

Charged with the preparation and execution of plans to insure the adequate maintenance of French fiscal machinery, the Financial subsection commenced its task by a study of private and public finance in the indicated area of the Army's operations.

In view of the scale of invasion plans it became apparent that the financial life and economy of the liberated regions would be unavoidably disrupted. No one could accurately predict the responsibility that might be assumed by the Free French government and by local public authorities. The sub-section planned, therefore, for an active, as well as supervisory, part in the restoration of sound financial conditions. It prepared two alternative courses of action. One envisaged the assumption of almost complete responsibility by the French, and the other called for a more active participation by Civil Affairs in financial control and rehabilitation.

These courses of action, translated into specific instructions to Civil Affairs staffs and Detachments, dealt with the reopening of banks and other financial institutions, the blocking of enemy accounts, property control, the issuance of supplementary currency and exchange regulations, the terms and conditions for the advance of Civil Affairs funds, the control and accounting for Civil Affairs expenditures and receipts, the establishment of inflation controls, and the handling of municipal finance problems.

Close contact was maintained with the Currency Section for FRANCE of the French Country Mission at Supreme Headquarters. Civil Affairs Detachments of Companies were supplied francs for initial operations. C and D type detachments were given 50,000 francs each, B Detachments received 100,000 francs, and A Detachments received 250,000 francs. A reserve of 5m0,000 francs was carried by Army G-5. One officer in each Detachment was appointed a sub-accountant and received an accounting kit containing accounting forms, receipts and payment vouchers. Oral instructions were given as to accounting procedure and the use of Civil Affairs funds. Stress was laid on measures to prevent inflation in FRANCE, such as restrictions on troop spending, restrictions of bank loans, price controls, elimination of black market activities, and currency exchange controls.

Throughout this preparational phase constant liaison was maintained with the Finance Officer of the Army and concurrences were obtained from him on all matters of mutual concern. The Chief of the Financial sub-section was appointed Purchasing and Contracting Officer and Class A Finance Agent to act for the G-5 Staff in emergencies.

Toward the end of June a supply of Currency Proclamations was received from First U.S. Army Group and distributed to Detachments which were to operate under Third U.S. Army. These Proclamations informed the French people of an issue of Supplemental francs to circulate on a par with Metropolitan francs, established a rate of exchange for dollars, sterling and francs, and placed restrictions on foreign exchange transactions. Plans for the publication of the Proclamation were completed.

PUBLIC SAFETY

Public Safety was to insure by survey, inspection and recommendation that the French Civil Police and Security Agencies were adequate and competent to prevent civilian interference with military operations and security. As special tasks, it was made responsible for police functions, fire defense, passive air defense, gas defense, protection of records and archives, assistance in the regulation of civilian traffic and the movement of displaced persons.

In the study of these various functions, the importance of the sub-section's coordination with the Provost Marshal and Counter-Intelligence Corps was recognized, and immediate steps taken to exchange information and to integrate policies.

PUBLIC HEALTH

The Public Health officer was charged with seeing that healthful conditions were maintained among civilians in the Zone of the Army, placing the responsibility of local health conditions on local health officials. He was to supervise and stimulate their activities as necessary, and in emergencies to direct the civilian public health organizations. Other duties included the distribution and proper use of emergency civil medical and sanitary supplies, and maintaining close liaison with the Army Medical Services.

First weeks were utilized in accumulating data from area studies and medical and engineer intelligence reports. From this data a reasonably accurate assumption was made as to conditions and customs in FRANCE. Policies adopted were broad enough to give adequate exercise of initiative to Detachments in the field, and at the same time were in sufficient detail to give Civil Affairs officers greater confidence in handling public health problems when no Public Health officer was attached to their organizations.

Arrangements were made to use the medical officers in the Medical Detachment of the 2d European Civil Affairs Regiment as Public Health specialists. Numerous conferences were held with these officers, and with other personnel to thoroughly indoctrinate them with plans and policies outlined.

CHAPTER 2
PRE-OPERATIONAL ON CONTINENT

SECTION I

GENERAL

G-5 Section arrived in FRANCE in two echelons on 7 and 18 July. In addition to its assigned strength, the section had attached to it four officers of the U.S. Navy, a historian, a specialist on arts and monuments, and a liaison officer of G-5, Army Group. As no additional vehicles had been provided, transportation became a continuing problem.

Arrangements were made at once with First U.S. Army to permit observational missions to that Army's Civil Affairs Detachments in the field. The VIII Corps was already engaged in active operations and had accumulated a wealth of Civil Affairs experience, from which immediate effort was made to profit. At the same time French-speaking officers of the Army Civil Affairs Reserve were employed in interviewing civilians to obtain all possible information on German plans and practices in the evacuation of towns, the handling of refugees, and on civilian conditions behind the German lines.

Corps and Division Civil Affairs staffs, as they arrived in FRANCE, were advised of the developing situation. Emphasis was placed on the mounting evidence of the French authorities' willingness to cooperate, on the demonstrated efficiency of the French relief agencies and the loyalty of the Gendarmerie.

On 18 July, the first contingent of Civil Affairs troops landed at UTAH Beach. Immediately that these units were bivouacked, they were briefed by Army Staff officers. Key officers were given opportunities to make first hand observations in liberated towns. Detachments were brought to Army headquarters for special instruction.

The cardinal principle of successful Civil Affairs operation is supervision of local government to the end that it becomes an agency contributing to the military effort. It became increasingly clear during July that the local governments of FRANCE were eager to accept that role; that they only wanted the chance.

The effort was directed toward seeing that they got that chance in every town entered by a Third U.S. Army Civil Affairs Detachment.

SECTION II

PERSONNEL AND ADMINISTRATION

The relatively short period between the arrival of the Section in FRANCE and the time when the Army became operational was spent in routine administrative work and bivouac training and discipline for enlisted men.

Liaison was established between Army and British Civil Affairs officers, assigned to American Detachments, by the attachment to this staff by Supreme Headquarters Allied Expeditionary Force of a British officer.

SECTION III

INTELLIGENCE

On 14 June, an officer was placed on temporary duty as liaison officer and observer with the AC of S, G-5, VIII Corps. He embarked with VIII Corps on D plus 18 and remained with it until 12 July. His detailed reports informed Army's Civil Affairs troops of actual field conditions in FRANCE.

First hand investigations ranging from CHERBOURG (O-11) to the front line were carried on throughout the American area in NORMANDY to obtain information to serve as a guide for the operational phase. Daily conferences were held with AC of S, G-5, in assisting in preparation of plans and orders. The bulk of all Forward Echelon correspondence and reports was handled by Intelligence. Three Civil Affairs Bulletins were published.

SECTION IV

PLANS AND OPERATIONS

Every effort was made to train and equip non-operational Civil Affairs units for becoming operational in the near future. Training programs were reviewed and changes recommended. Selected Detachments of the Army's Civil Affairs Reserve were given special instruction in refugee work and supply management. Daily briefing on the tactical and Civil Affairs situation was instituted. A large G-5 operations map was constructed and posted daily.

The VIII Corps, while attached to First U.S. Army, was furnished Civil Affairs Detachments from 1st European Civil Affairs Regiment for deployment in the Corps Area. It was the policy of the VIII Corps to send Detachments forward to its Divisions for deployment as soon as tactical conditions permitted, or wherever an emergency demanded. This policy was adopted for Third U.S. Army. It was planned that, except at important governmental seats and large cities, the assignment of a Detachment to a locality would be temporary and terminate prior to passage of the Army rear boundary forward of the locality.

REFUGEES AND DISPLACED PERSONS

In this period, it became apparent that the displaced persons problem, at least in the coastal areas, was negligible; that the French authorities were willing and able to care for their own refugees; that the amount of destruction and military activity which had occured in a community governed the numbers of refugees.

It was also observed that a generally stabilized condition of combat, with the necessary civilian restrictions imposed, prevented individuals from rapidly returning to their homes, increasing the problem of the care of refugees.

SECTION V

RELIEF AND SUPPLY

One Naval officer was added for liaison with Navy Civil Affairs representatives at ports to protect the Army's interests in harbor traffic and fishing regulations. Also three officers from Company F, 2d European Civil Affairs Regiment, were temporarily attached to survey and report on possible forward public utility requirements.

Detachment and Reserve officers of the Army's Civil Affairs units were brought in by groups for indoctrination and orientation. Coordination was established with the AC of S, G-4, and the supply branches of the Army as to methods of locating and transporting civilian relief supplies in the Army Zone when the Army became operational. After several days' training in procedures for handling Civil Affairs supplies, a Navy officer was attached to Communications Zone at CHERBOURG (O-11) to keep G-5 advised on imported relief supplies arriving at that port.

Digitized by Google

DECLASSIFIED

LABOR

A conference with Army engineers developed that no civilian labor procurement service was to be established in the Army Zone of Operations as a military function. Consequently, a program of obtaining and coordinating labor information on a regional basis under the supervision of French authorities was laid out.

PUBLIC WORKS AND UTILITIES

Such power lines as were readily available in the liberated area were inspected to determine seriousness of damage and amount of repair needed. Utilizing three officers of Company I, Specialist Reserve, a study was made of power needs of the territory expected to be covered in the Army's advance.

TRANSPORTATION

Talks with transportation officers of [illegible] that transportation of relief supplies to distribution points and the need for additional transport by Detachments were major Civil Affairs problems.

Through G-4, arrangements were made with Advanced Section Communications Zone for the transport of relief supplies from beaches to Army depots. Inspections were made of French railroads and canals on the peninsula.

COMMUNICATIONS

Inspections of the communications system in the liberated area showed that while cables and wires had been cut by bombs and gunfire, the German plans for destruction had not been carried out. Few switchboards had been deliberately damaged and there was no indication of deliberate damage to long distance cables. It was obvious that if this condition prevailed in the area liberated by the Army, the resources of the entire French communications system could be devoted to the Army's use as soon as repairs were made. Plans were made to achieve this objective as fully as possible with French civilian assistance.

PUBLIC WELFARE

It was learned that where the French authorities and agencies were operating in areas that had not suffered complete devastation, the originally elaborate Civil Affairs plan for operation of supplementary relief agencies was unnecessary, according to First U.S. Army experience.

SECTION VI

GOVERNMENTAL AFFAIRS

To further prepare for operations in FRANCE, public officials in the towns liberated by the First U.S. Army were visited upon the invitation of the AC of S, G-5, of that Army. Thus officers saw at first hand the ability of the French, with the encouragement of Civil Affairs specialists, to reorganise and set in motion the machinery of public administration.

LEGAL

On invitation of the First U.S. Army and of the 21 Army Group, British, the sessions of the local courts then functioning were attended and a first hand knowledge of the Juge de Simple police was obtained.

FINANCIAL

Study and observation of the operations of First U.S. Army Detachments in the NORMANDY peninsula indicated that the French [illegible]

PUBLIC SAFETY

Additional conferences were held with Public Safety officers of the First U.S. Army and an appraisal was made of the status of the Gendarmerie and of other local police organizations. Representatives of the sub-section were present at a meeting held at LA HAYE DU PUITS (T-1884), attended by Mayors of the Canton and presided over by the AC of S, G-5, VIII Corps. At this meeting, public safety problems were considered, among them being the employment of auxiliary Gendarmes, and Gardes Champetres by French authorities.

PUBLIC HEALTH

Once on French soil, an appraisal was made of the accuracy of the information that influenced the adoption of original policies. The assumption of policies proved to be substantially correct with one outstanding exception: the nutrition, general health, and sanitary condition of the population were better than had been foreseen. Prevalence of contagious diseases was less than anticipated. Number of refugees was less than expected. Sanitary utilities of the cities were extensively damaged. The total lack of repair facilities or salvage materials caused disruption of functions for a longer period of time than was anticipated, but did not produce any serious Public Health problem because of dispersement of population from cities affected.

Erroneous assumptions did not warrant the change in general policy, however, for the following reasons: The actual field experience showed conditions to be better than anticipated, and the general policy covered all the problems encountered. The region of operations was not representative of all FRANCE in that it was a purely agricultural area with small towns and scattered populations. Moreover, assistance to public health was afforded by the "standfast" regulation that held dispersed populations in place, checking the spread of disease.

CHAPTER 3
AUGUST OPERATIONS

SECTION I

GENERAL

The break through the German lines at AVRANCHES (T-21) late in July, and the swift victories of Third Army troops in BRITTANY that followed during August, changed the Civil Affairs operational picture completely.

Operations in the NORMANDY Peninsula had been paced to a relatively slow development of the liberated area. Detachments were distributed heavily through towns. Distances between headquarters were short. Most towns had been severely damaged by combat.

The very opposite situation arose in BRITTANY and in the rich Regions of ANGERS and ORLEANS as our armored divisions and infantry swept eastward in rapid conquests.

The degree of damage to towns decreased almost in exact ratio to the increase in the pace of advance. The problem now became one of spreading Detachments thinly, of a single Detachment taking over an area comparable to that previously allotted to a company of Detachments. Liaison and communications became major problems — toward the month's end, VIII Corps G-5 was more than 350 miles from Army G-5.

More and more reliance had to be placed on the French. Whereas proclamations and other notices had been posted in towns by hundreds, they now had to be provided by thousands. In a single printing at GRANVILLE (T-13), 50,000 copies of such notices were turned out to meet the demands of Corps and Division staffs.

The early forecast of French cooperation made by the Army Com-

French nationals were allowed to keep arms they had seized from the Germans or which had been dropped to them by parachute by allied air forces. This demonstration of confidence in the loyalty of the population, and in the ability of the French authorities to police their own communities, proved invaluable to French morale.

By 6 August, a total of 119 principal towns and a population normally numbering 3,500,000 was under Civil Affairs supervision, with French authorities performing all administrative functions. Though refugees in great numbers were present throughout the Zone of Operations, nowhere were they impeding military movements. No serious problems of relief had arisen. Public health was surprisingly good.

During a temporary truce on 14 August, 24,000 refugees were marched out of the besieged city of BREST (V-90) by the German commander to become the charges of French civil authorities and Civil Affairs. A special relief team of the Army Reserve was rushed to the scene. Relief supplies were carried from RENNES (T-15) in salvaged German vehicles. A refugee camp was set up at [illegible]ARENNES (R-0011). In less than a week the entire 20,000 refugees were distributed through the rural areas about BREST and ceased to be an Army problem.

A confused political situation existed at VANNES (R-1809). There was shooting in the streets. Appointment on 15 August of FFI Colonel de [illegible]IVRIA as Military Commandant for the Department of MORBIHAN, and his creation of a military court reestablished law and order in twenty-four hours.

NANTES (Q-06) reported 200,000 refugees in LOIRE INFERIEURE as a result of organized evacuations into that Department from other areas. But again, as at BREST (V-90), they were distributed among the rural population and presented no problem the French themselves could not handle.

Large quantities of captured and abandoned German supplies were uncovered by Civil Affairs Detachments and reported through Army G-5 to interested Army services. Food shortages in one district were relieved by the policy of distributing through the French the surpluses of other districts.

Much heavy wire construction was saved the Signal Corps by the prompt restoration of civilian telephone trunk lines between AVRANCHES (T-21) and LE MANS (Z-4063), and thence through MAINTENON (R-4617) to PARIS (S-04).

The great needs that developed were of coal for the operation of utilities and of oil and gasoline for motor transport and harvesting machinery. With the Quartermaster cooperating by releasing German stocks that were of too low a grade for military uses, it was possible to bridge over emergencies in most instances. Huge supplies of captured German food were made available to civilian relief agencies by this procedure.

Before the month's end, G-5 had issued for posting in French communities 1C,000 public safety circulars, 15,000 proclamations by the Supreme Commander, 15,000 posters limiting civilian circulation to six kilometers, and 8,000 RF (Republique FRANCAISE) police arm bands.

Refugees from PARIS in the Army's Zone of Operations were estimated at 100,000, the total of all refugees at 400,000. However, the major Civil Affairs mission of keeping military routes clear was being carried out as ordered.

SECTION II

PERSONNEL AND ADMINISTRATION

Examination of reports from Detachments deployed in the Army Zone and routing them to staff sections and services concerned involved considerable time and effort. Initial reports were slow in arriving and voluminous in quantity. Reports from Detachments covered many subjects such as captured enemy supplies, unexploded bombs, location of graves, and civilian claims.

Many requests for specialists were received from Corps and Detachments in the field. [illegible]

Digitized by Google

Requests for battle replacements were few, four being processed during the first month of operations.

Frequent movements of this headquarters, averaging once per week, caused delays in the receipt of morning reports and other documents, making it difficult to maintain complete and current reports.

Early in the operational phase several French liaison officers reported for duty with this section. Assignment of french officers to Corps Staffs was made, their duties being to maintain liaison with civilian agencies in the Zone of Operations with relation to Civil Affairs needs.

SECTION III

INTELLIGENCE

Daily liaison was maintained with all Corps throughout August. Officers assigned to this duty from Civil Affairs Company reserves covered from 100 to 350 miles every twenty-four hours, bringing field staffs from twenty-four to thirty-six hours in closer contact with Army Headquarters.

A liaison officer was placed with Counter-Intelligence Corps, working daily with that Corps' officers in the field. A policy was developed of keeping Civil Affairs and Counter-Intelligence Corps officers stationed in towns in close proximity to enable immediate solution to common problems as they arose. Through the same officer security regulations were enforced with the operating Civil Affairs Detachments.

More than 500 French officials and miscellaneous civilians were questioned by interviewers of specialist reserve, Company I, to determine civilian sentiment and obtain information of civilian conditions behind enemy lines. These interviews developed the following salient facts:

(1) The enemy had no concerted evacuation plan for civilians.

(2) There was no evident enemy intention to use civilians to impede our Army's advance.

(3) French agencies were prepared and able to handle refugee problems with little assistance.

(4) The service in which Civil Affairs could be most valuable was to perform liaison with the French to convey to them the wishes of the Army Commander, and to lend prestige to local governments by giving open evidence of the Army's support

Daily and fortnightly Civil Affairs Summaries were prepared for higher headquarters, two Civil Affairs Analyses and three Civil Affairs Bulletins were published, as well as secret special reports and analyses dealing with political and religious influences in the Army's Zone of Operations. A running historical record was maintained.

An average of forty reports daily were received from Corps and Division staffs and operating detachments; these were analyzed upon receipt, excerpted and turned over to Branch Chiefs and Specialists for action as required.

SECTION IV

PLANS AND OPERATIONS

The following Civil Affairs Detachments were left in position by VIII Corps on 1 August, while attached to First Army, and passed to control of Third Army:

Detachment	Location	Coordinates
D681	SAINTILLY	T-2224
D741	LA HAYE PESNEL	T-2528
D121	GRANVILLE	T-1134
D681	AVRANCHES	T-1640
D781	MONTMARTAIN	T-1750
B1A1	AVRANCHES	T-2716
D691	GAVRAY	T-1441
D701	BRETEY	T-2220

Additional Civil Affairs Detachments were operated in the following localities within the Army Zone of Operations during August:

ALENCON (Z-3565)	MANTES GASSICOURT (temp)(A-6061)
ARGENTAN (A-6277)	MELUN (A-2586)
AVRANCHES (T-2716)	MONTARGIS (A-4745)
BAYEUX-ISIGNY (T-1486)	MONTMARTAIN (T-1752)
BRETEY (T-2220)	MONTREUIL (temp)(T-3289)
BRIONNE (T-1742)	MONTSURS (T-2217)
CAEN (temp)(A-1378)	NANTES (A-6560)
CHANTRAN (A-3902)	ORLEANS (A-6342)
CHATEAUDUN (temp)(A-2361)	PITHIVIERS (temp)(A-9367)
CHATEAUGIRON (A-3375)	PONTORSON (A-6475)
CHATEAU THIERRY (temp)(A-8304)	QUIMPER (A-6476)
DINAN (A-7674)	RENNES (T-1653)
DREUX (A-3136)	ST BRIEUC (A-7484)
ETAMPES (temp)(T-6134)	ST NAZAIRE (T-4703)
EVREUX (temp)(T-3772)	ST MALO (A-7716)
FOUGERES (A-3476)	ST QUEN (temp)(T-5454)
FONTAINEBLEAU (temp)(A-2891)	ST VALERIE (temp)(Z-1352)
GAVRAY (T-1441)	SAINTILLY (T-2224)
GRANVILLE (T-1134)	SEZANNE (A-1703)
JOINVILLE (A-9511)	VERN (A-6868)
LAFLECHE (A-1905)	VITRE (temp)(Z-1757)
LA HAYE PESNEL (T-2528)	TOURS (T-4473)
LANDIVIA (A-6741)	VANNES (A-1459)
LAVAL (T-2640)	VILLENEUVE (temp)(T-0512)
LE MANS (T-4703)	VILLENEUVE (temp)(A-8968)
MAMERS (Z-3569)	

To obtain earliest possible establishment of Detachments in localities as they were uncovered, one standard Civil Affairs Company including its administrative headquarters was attached to each Corps, and Corps further attached Detachments to Divisions for movement to Detachment destinations. Each Company headquarters was charged with the responsibility of supplying and administering its organic Detachments.

Company I, 2d Civil Affairs Regiment was retained at Army Headquarters as a reserve. Its Detachments were sent forward to Corps as reinforcements were needed. At the same time, specialist officers of Company I were detailed to undertake special missions in Corps areas when requested, and to prepare special analyses and reports required by higher headquarters.

Due to the extensive areas soon uncovered, Detachments were placed only at the rate of one in each Arrondissement, excluding temporary assignments. Once permanently assigned, the Detachment remained in place and became responsible to successive higher commanders as the tactical rear boundaries of Divisions, Corps and Army were successively moved forward of its locality. But when any Detachment was no longer needed in a given locality, it was removed and placed in either the Army or Corps Civil Affairs Reserve later to be sent forward and used again. Thus Detachments were placed down in front and rolled up behind.

On 16 August, on order from higher headquarters, the operational plan was essentially changed. Companies A, B, C and I of 2d European Civil Affairs Regiment were attached to 1st European Civil Affairs Regiment, which in turn was attached to Twelfth Army Group. Headquarters/Headquarters Detachment, 1st European Civil Affairs Regiment, along with Company D, 2d European Civil Affairs Regiment were attached to Communications Zone to be held for subsequent use by Supreme Headquarters Allied Expeditionary Force. Then, on 29 August, the following Detachments were attached to Third Army:

B112	D582	D5A2	D3C2
B212	D682	D6A2	D4C2
D112	D782	D7A2	D5C2
C122	C112	A1B2	D6C2
A1A2	C2I2	B1B2	D7C2
B1A2	A112	C1B2	D3A1
C1A2	B112	C2B2	D4D1
C2A2	C122	D1B2	SRA2
D1A2	D2C2	D2B2	SRB2
D2A2	D3A2	C1C2	SRC2
D3A2	D4A2	C2C2	SR12
D4B2			

All Civil Affairs administrative company headquarters were placed under control of 1st European Civil Affairs Regiment, which placed them at geographical locations considered central for supplying and administering surrounding Civil Affairs Detachments. The 1st European Civil Affairs Regiment assumed responsibility for the supply and administration of all Detachments.

REFUGEES AND DISPLACED PERSONS

The rapid movement of the Army resulted in the by-passing of many communities, leaving the local government and homes relatively intact in many of them so that local authorities were available and local resources adequate to care for the problem of refugees. It was both undesirable and unnecessary to establish formal collection points or permanent facilities for care of refugees under these conditions. Moreover, no opportunity developed for identification and separation of refugees from displaced persons and the establishment of permanent assembly Centers for displaced persons.

On the other hand, the necessity did arise of establishing routes over which refugees could move without obstructing Army operations and supply. Beginning 8 August, Detachments D1I2 and D2I2 were detailed to plot such routes. Upon being approved by 3rd Traffic Control Section, the selected roads were posted with signs reading Route Autorisee Aux Civils. Before the month's close they extended from FOUGERES (T-1441) to RENNES (T-15) as the southern extremity, and from RENNES to PITHIVIERS (A-9367).

In turn, Detachments were authorized to establish local refugee routes and signs were made available to them for posting. The Provost Marshal's Office was kept informed of where these routes existed.

Detachments reported in almost all communities refugees varying in number from a small group to several thousand, operating through the Maires, Secours National and the Croix Rouge Francaise. In most instances the Detachments were able to have the refugees billeted and fed without other military assistance. Only in two instances was it necessary to furnish relief supplies.

A special problem developed in the vicinity of MAMERS (Y-90) when the Germans expelled the city's civilian population in the probable hope of embarrassing the American forces. Detachment D1I2 was dispatched to this area and the 3rd Refugee officer, together with a French liaison officer, surveyed the area. Instructions were issued to the Maires and the Chief of Gendarmes of each community to clear the main highways and route individuals to communities where billeting facilities still existed. Six thousand refugees were entrained from LAVARDIN (A-1430) to MAMERS (A-4617). The refugees which came through the German lines were excellently handled by the French authorities, with the assistance of four women of the Military Liaison for Administrative Matters, through dispersal and billeting in nearby communities. Detachment D1I2 provided emergency hard rations, which included soap, codfish, pulses, biscuits, meat, milk and chocolate. Its officers coordinated the work of the Maires. The Secours National established emergency feeding stations where necessary and a total of 22,000 refugees were cared for without interference to military operations or supply, and without suffering to the individuals.

From 23 August to 25 August, a special survey was made to determine the number of refugees from PARIS located in the Army Zone and to discover what problems existed among them and possible steps to be taken for their control. Of the persons returned in numbers to the PARIS area, they would create a supply problem there that could only be solved by use of military vehicles to transport food. This survey indicated that a minimum of 100,000 PARIS refugees were in the Army Zone. Instructions were given to all Detachments and to the local officials rigidly to enforce circulation restrictions and to issue passes to PARIS only in event of grave emergency.

Informal arrangements were made to secure the services of American Red Cross civilian personnel to relieve the use of military personnel in caring for emergency problems and destitution among refugees and displaced persons.

The total numbers of refugees estimated by Detachments in the territory covered by the Third U.S. Army's advance was as follows:

week ending 7 August	45,000
week ending 14 August	9,000
week ending 21 August	185,835
week ending 28 August	400,000

About 1,500 displaced persons were reported.

SECTION V

RELIEF AND SUPPLY

By the temporary attachment, while in coastal areas, of a United States Navy officer with Civil Affairs training for port liaison, and of Specialist officers from Company I, 2d European Civil Affairs Regiment, it was possible to handle requests from Corps and Detachments for special assistance promptly and adequately.

Difficulties arose, of [illegible] strain upon all communicati[illegible] ments was rare. The wide di[illegible] Corps, had to be overcome by [illegible] Restrictions on travel by staff members, for reasons of necessity, made contact with the operating Detachments a problem of first magnitude.

DECLASSIFIED

Just prior to the time that the Army began operations, requisitions were prepared calling forward relief supplies from advance Section Communications Zone to supply dumps of the Army Quartermaster and Medical depots. These items consisted of food, soap, emergency feeding kits, sanitary and medical supplies. The Third U.S. Army Medical depot carried one Allied Relief Board Basic Medical Unit, and had two more "ABB" Units that were brought up to a depot further forward. Due to the rapid movement, however, the Quartermaster Class II and IV forward depot was not established in time to stock Civil Affairs supplies as planned.

A Civil Affairs Operational Supply Detachment was organized 6 August consisting of two officers and two enlisted men from Company I, 2d European Civil Affairs Regiment, which was given charge of the Civil Affairs supplies stocked at the Quartermaster Class I depot #10 near RENNES (T-15) for the use of the Detachment in BRITTANY. These supplies were called forward to the RENNES (T-15) depot on the Quartermaster daily telegram.

Emergency food and soap supplies were issued in the Army Service Area, AVRANCHES (T-2716), GRANVILLE (T-13) and GAVRAY (T-3041). They were transported to Detachments from Advance Section Communications Zone supply dumps by captured enemy trucks driven by drivers from the G-5 Pool. Normally it was the responsibility of Advance Section Communications Zone to forward supplies to army depots, but due to the extreme shortage of army trucks it was necessary to use Civil Affairs transportation that had been obtained by salvaging damaged enemy vehicles.

Requisitions were approved and minimum requirements of gasoline, diesel oil and greases were furnished through Detachments for use of civilian officials, doctors and veterinarians to enable them to resume essential duties.

The operation Supply Detachment at RENNES (T-15) depot called upon the Civil Affairs Transport Platoon to forward relief supplies requisitioned by Detachments in that Region. On one occasion several truck loads of food and soap were forwarded from RENNES (T-15) depot for the emergency feeding of approximately 24,000 refugees released by the Germans from the city of BREST (T-90).

At a conference on 31 July between French National authorities and officers of Communications Zone, 21 Army Group British and Twelfth U.S. Army Group, it was agreed, and confirmed later by Supreme Headquarters Allied Expeditionary Force, that delivery of imported relief supplies would be made to departmental directorates of the Ravitaillement General. It was further agreed that delivery of relief supplies would be made to mayors or local officials by Detachments in the combat zone only, and then only under pressure of temporary necessity. No cash payment would be demanded by the allied authorities delivering the commodities. Arrangements were made for future payment at a higher level.

Following the agreement the Regional Directors, L'Intendant des Affaires Economiques of the Regions of BRITTANY AND ANGERS, were called on for estimates of their minimum requirements of imported relief supplies. Both Regions reported a surplus of food stocks with the exception of sugar and salt. Their only requests were for immediate supplies of coal, gasoline, and fuel oil to care for immediate harvesting needs. Coal was not available but requisitions were approved for Civil Affairs gasoline and diesel oil in sufficient quantities to get the harvesting of crops under way in both Regions. The requisitions for diesel oil were furnished fully in the Region of ANGERS, and partially so in the BRITTANY area. Gasoline was not supplied from the dumps on account of the extreme shortage, but small supplies of captured enemy gasoline, diesel oil and coal were released for civilian use.

Assistance was given the French in working out non-military routes whereby civilians' vehicles could rush local food surpluses to PARIS.

The Quartermaster Class I dump #10 at RENNES (T-15) closed as of 23 August. The stock of Civil Affairs supplies had been issued in its entirety, and the Operational Supply Detachment was returned to Company I.

Plans were made to sell captured enemy food supplies released for Civil Affairs use, to French officials in lieu of relief supplies diverted for the feeding of PARIS.

ECONOMICS

During August the Army passed through three Regions — ROUEN, RENNES and ANGERS. For each a report covering all phases of economic conditions was prepared covering such information as:

1. Existence and state of rationing system in the area;

2. Surplus food products and estimate of their amount;

3. Existence of black market — cause and extent and in what products, prices charged;

4. Requirements of Civil Affairs supplies immediately needed to assist in harvesting crops, in the preservation of food and rehabilitation of food processing industries;

5. Attitude of French authorities to opening of French restaurants to military personnel.

6. List of established prices in the area.

Detachments under Army control were visited to impress them with the necessity of making out requisition forms for supplies needed to preserve food and to assist in restoring wherever possible home building and repair industries.

A special map was prepared for the Army Engineer showing the location of all important quarries and a list of all important sawmills and their locations in the Region of ANGERS. Following are some of the items reported:

1. To G-4, some 900,000 eggs near LE MANS (Z-4063). Eggs were later purchased by the Quartermaster.

2. To G-4, some seven tons of fresh pears available at ANGERS (O-8279).

3. To Signal Corps, location of a large German Signal Supply Base near ANGERS (O-8279).

4. To Communications Zone, numerous local stocks of cement.

5. Also to G-4, the existence of a battery factory near FOUGERES (Y-3878) which had a supply of raw materials, and needed only minor repairs to begin operations; two large warehouses of writing paper and office supplies at ANGERS (O-8279).

6. To Quartermaster, VIII Corps, fifty tons of frozen meat and seventy-five tons of frozen vegetables discovered at REDON (H-6805).

A report was made to Army Engineer concerning captured equipment in the railway yards at TROYES (Y-2873), including 120 carloads of construction materials of all kinds and 400 to 500 empty cars.

A large chart was developed for recording all information received from Detachments regarding the food situation. This included specific information on the estimated days food stock on hand in each Detachment area, the flour milling capacity of the area, and the status of food processing industries. Another chart was maintained on natural resources and important factories reported by Detachments, such as quarries, gravel deposits, sawmills, flour mills, captured German stores and lumber.

LABOR

Regional labor resources and recruiting facilities were investigated. The presence of large available surpluses of civilian labor were disclosed over all three regions. It was learned that unskilled and semi-skilled labor groups could be obtained from the following sources:

1. Factory workers from plants shut down by lack of power or raw material, or because of war damage;

2. Disbanded resistance forces, now returning to their homes;

3. French Todt workers returned to their previous places of residence;

4. Farm workers available after the harvest period.

The utilization of French employment facilities was found to be entirely feasible as most of these were either intact or being reorganized and both ready and willing to cooperate fully in procuring civilian labor for Army use, particularly since this would reduce unemployment caused by local war conditions.

When need for registration of all available civilian labor was emphasized to the French authorities, it was found that this was already under way. A summary of labor conditions was furnished to the Army Engineer and to BRITTANY Base Section. Individual assistance to local Detachments was given in cases where prompt procurement of civilian labor was requested by the Army Engineer.

PUBLIC WORKS AND UTILITIES

The normal flow of power in the uncovered area was from the south and the east into the area from which the invasion began. Hence the population needing power was uncovered before the power plants that normally supplied them were taken. Water was low and hydro plants could supply very little above transformer and line losses. When uncovered, the steam plants were damaged, none of them being capable of full operation. Coal supplies were adequate for only a few days' operations. Transmission lines had been cut and some transformers were out of operation.

A conference was held in RENNES (T-15) on 18 August at which time the power companies of the BRITTANY peninsula submitted a consolidated table showing the status of generating plants as contrasted with power needs, and stating the amount of coal required by the plants uncovered as of that date. In this way a large number of uncoordinated activities were consolidated, and the channels of control were specified to the power companies. The work of these companies in pressing repairs and in meeting military and public essential needs was exemplary. The supply of delivered power by the end of August, however, had dropped to three to five percent of 1939 consumption due to lack of fuel.

On 6 August a field inspection was made of the power plant near VEZINS (T-4004). The dam was found to be of a type that only an all out air attack, concentrated in time and area, could cause a military danger. It was recommended that the lake should not be drained because of the improbability of damage from bombing and the serious need for the power. This recommendation was concurred in and the lake was not drained.

In most cases the damage to water works was incidental to combat or to bridge demolitions where water pipes crossed beneath bridges. Being buried, the water mains were not often damaged by combat except where bombs had been dropped from planes. Excepting from heavily bombed towns, there were few requests received for water pipes.

No major sewage problems were encountered, sewers not being as extensively used as in the United States. Pipes were little damaged, except where there had been heavy bombing. Cooperation from Army authorities to permit work on blocked sewers across or along military routes was the major type of request made.

Gas plants were permitted to function where they had coal. In ST. BRIEUC (S-2304) about 400 cubic meters per day were being produced from wood for hospital use.

There had been very little road maintenance by civilian agencies as it has not been a primary need. Streets in devastated areas of towns were initially cleared by the Army Engineers along military and essential non-military routes. Further clearance was undertaken by the civilians within individual towns.

TRANSPORTATION

In an effort to assure Detachments of needed additions to organic transportation in the form of passenger cars, small trucks and motorcycles, the following steps were taken:

Digitized by Google

1. From 1 August to 8 August the Transportation sub-section attempted to find and repair enemy vehicles, using a squad of five G-5 Section drivers. A number of vehicles, chiefly large trucks, were secured and a freight-carrying pool for Civil Affairs supplies was established.

2. On 8 August it was decided to utilize the 2d Transport Platoon to augment these salvage efforts and to activate a Transportation Pool.

3. The Transport Platoon on 14 August was moved to the city of RENNES (T-15) to operate the Civil Affairs Transportation Pool in connection with the Civil Affairs Supply Depot and to continue repairing enemy vehicles for Civil Affairs use.

During the month thirty abandoned enemy vehicles were located and repaired. Six large trucks were retained by the Transportation Pool, and the others which included sedans, small trucks and specialized vehicles were turned over to those Detachments needing them most.

A number of caches of captured parts were located for use in repairing vehicles abandoned by the enemy. Miscellaneous parts were obtained by stripping enemy vehicles which were too wrecked to salvage. A number of enemy vehicles were partially or wholly repaired and later abandoned because of defects which developed in road tests.

In searching for vehicles to salvage, reconnaissance trips were made to forty-two newly liberated towns. In addition, fifteen motor vehicles which had been found by Detachments were reconditioned and returned to Detachments after Army registration numbers had been obtained.

The Transportation Pool's fleet of six large salvaged German trucks were called upon for many services. Originally the pool was set up to haul relief supplies from depots and railheads to points of distribution, and to bring forward additional stocks to the depots. Its services were extended, however, to help meet any operational emergency that arose, to get soap and food to critical shortage areas, to move refugees and displaced persons and Detachments, to carry captured enemy supplies to central warehouses and to transport supplies needed to establish refugee camps.

Better results in salvaging enemy vehicles might have been obtained if German equipment had not been so badly worn. Almost all vehicles found in "caches" had been laid up by the enemy for major repairs. Some showed evidence of sabotage by French mechanics. Some had been wrecked by the Germans.

Reports of conditions of rails and bridges and location of rolling stock were furnished to Railway Division, Engineer Section, Advance Section Communications Zone, as received from Detachments.

Reconnaissance of railroad lines was made in BRITTANY. It established that the railway line from VITRY (T-6819) could be operated through RENNES (T-15), ST. BRIEUC (S-2304), PLOERMEL (R-9511) and MORLAIX (R-4617) to the combat area near BREST (V-99) to supply troops there. Freight cars, locomotives and crews were located in quantities sufficient for the immediate operation of four or five trains daily. The availability of spur lines was also confirmed. Repairs by the French were requested, and obtained, wherever the lines were needed. Many sections of the RENNES (T-15) -- LAVAL (T-6846) railway were cleared and repaired for the Army by civilian railway labor.

Another reconnaissance revealed that because of the neglected condition of the waterways and absence of boats, the BRITTANY canal systems could not be utilized effectively during the combat phase.

COMMUNICATIONS

It became imperative to direct all efforts to repairing lines required immediately for the Army, rather than for all liberated territory, a necessity made urgent by the Army's rapid advance.

The open wire toll lines along the coast road from ST. JEAN (T-1732) to GRANVILLE (T-13) were inspected. All PTT, (Post, Telephone, Telegraph) buildings and equipment were found intact and able to operate as soon as power was available. The open wire toll lines were broken by bombs in two places. Repairs were started immediately through the cooperation of the French PTT Receveur. This made circuits, requested by Advance Section Communications Zone, available from GRANVILLE to JOUILLEVILLE (T-1327). A representative of the French Government also consented to cutting the local cable at the outskirts of GRANVILLE to enable the Army to splice the GRANVILLE -- AVRANCHES (T-21) German cable directly to the GRANVILLE telephone exchange.

The main toll cable was inspected from AVRANCHES (T-21) to RENNES (T-15), with the Chef-de-Station, AVRANCHES, who had been in charge of large French sabotage on German communications in this section. This official traced the route and located not only the existing breaks, but pointed out those that had been repaired by the Germans prior to liberation. This latter information saved a great deal of time by making it unnecessary to excavate recently covered bomb holes to inspect the cable.

A crew of French cable splicers was obtained through the cooperation of the Regional Chief Engineer at RENNES (T-15) and his assistant. These started the following morning to repair the cable from AVRANCHES (T-21) to MIXIAC (A-9174) to RENNES. They also initiated the repair of the repeater station at AVRANCHES and at MIXIAC which had been damaged by German demolition bombs and grenades. The Advance Section Communications Zone Signal Corps undertook the supervision and supplied technicians for this work.

The main French underground cable system to PARIS paralleled the Third U.S. Army axis of communications fairly closely from VITRY (T-6819) to MOGENT (X-8817), and it was apparent that the system would be of great value in communications for obtaining supplies when the Army moved east of PARIS. For these reasons, the work on restoration of this system was continued.

The main cable from RENNES (T-15) to LE MANS (Z-4063) was inspected by an officer of G-5 Section. There were only five positive breaks in this section, and upon report of them an officer of the 34th Signal Construction Battalion was assigned with personnel to obtain circuits for use of the Army from VITRY (T-6819) to LE MANS (Z-4063). He worked untiringly on this mission and the circuits were obtained.

The repeater stations at RENNES (T-15), LAVAL (T-6846) and LE MANS (Z-4063) were demolished almost completely by the Germans, but work on the salvage of usable material was started immediately, in each case by the local French PTT officials upon G-5 request.

At RENNES (T-15) an officer was assigned to coordinate repair work and assignment of circuits in the cable. This Civil Affairs Detachment officer performed outstanding work in restoring communications in RENNES and on the long distance system.

The Army Chief of Staff approved the restoration of telephone service for military personnel and essential civilian activities and postal service for all civilians in RENNES (T-15), LAVAL (T-6846) and LE MANS (Z-4063) and the cities under the jurisdiction of the Civil Affairs Detachments in those cities as soon as the Detachments, with the concurrence of the Counter-Intelligence Corps and local French authorities believed the situation warranted it. Both postal and telephone service were limited to intra-city usage only, but it helped considerably in local administration.

The Nineteenth Tactical Airforce was assisted in obtaining communications for four airfields. In this work the knowledge and energy of the Controleur Station Cables, LE MANS (Z-4063), was invaluable. This official had an intimate knowledge of the German cable bypasses around the city and how the Germans had terminated sections of the cables in bloodhouses at each entrance to the city. This knowledge saved important time in establishing communications for both the Nineteenth Tactical Airforce and the Army in LE MANS. Assistance was also given in obtaining communications for Advance Section Communications Zone in LE MANS through the efforts of the local French PTT officials.

In cooperation with the Ninth Airforce, which had been assigned the duty of repairing the entire cable from RENNES (T-15) to the German border, an inspection was made of the section from LE MANS (Z-4063) to CHARTRES (R-30). This section from LE MANS to MOGENT (X-8817) had been previously inspected in cooperation with an officer of Advance Section Communications Zone. Personnel from Advance Section Communications Zone repaired breaks between LE MANS and MOGENT, making eight circuits available for Third U.S. Army axis of communications on its move eastward.

The repeater station at MOGENT (X-8817) was almost completely demolished, but such salvageable equipment remained. Salvage was started immediately by French authorities. The provisional mayor of MOGENT arranged for cleaning an adjacent Gergia sausage factory for a temporary repeater station.

Since neither Civil Affairs nor the Counter-Intelligence Corps had representatives in MOGENT (X-8817), and the city was being administered largely by the Free French, the Receveur was authorized to restore telephone service for essential civilian activities, and postal service for all civilians, limited to intra-city usage. Army G-2 and Signal officer concurred in this informally.

On 17 August, an officer from the Specialist Reserve Pool, Company I, 2d European Civil Affairs Regiment, was authorized to assist this sub-section. He inspected the cable from CHARTRES (R-30) to MAINTENON (R-4617) with the officer in charge of this sub-section, and later, the section of cable from MAINTENON to PARIS.

The repeater station at MAINTENON (R-4617) was found intact, due to the heroics of the Chef-de-Station who cut the wires connected to demolition bombs, removing the bombs as the Germans left the city. This official also prevented the Germans from igniting inflammables they had placed in the building. There were no observable breaks in the cable from CHARTRES (R-30) to MAINTENON (R-4617), except in the city of CHARTRES. Repairs on these lines were started by French authorities.

Assistance was again given the Ninth Airforce in obtaining communications necessary to airfields.

The open wire long distance lines were inspected from BROU (R-1378) to CHATEAUDUN (R-2361) to ORLEANS (R-64). The Receveur agreed to repair lines essential to the Army from BROU to the boundary of his area; The Directeur to repair the open wire lines as far as necessary toward CHATEAUDUN. Steps had already been taken by PTT officials to salvage material in the demolished repeater station.

The three PARIS-BORDEAUX (O-89) toll cables were inspected from a point just north of ORLEANS (R-64) to the repeater station at ETAMPES (R-8896) with two representatives of Twelfth U.S. Army Group. All three cables were undoubtedly damaged in the city of ORLEANS (R-64), but there was no evidence of damage along the highway. The repeater station at ETAMPES was demolished but some material was salvageable.

The open wire toll lines from PITHIVIERS (R-9367) to MELUN (S-2506) and the cables from MELUN to FONTAINEBLEAU (X-2891) and MONTEREAU (X-4788) were inspected. The Receveur Principal, and Conducteurs-de-travaille, agreed to repair the open wire to meet the circuits from ORLEANS (R-64) to PITHIVIERS (R-9367). These French authorities also started to repair the cables in MELUN where they had been destroyed when the bridges were blown out. These cables are important links in the PARIS to LYONS (X-99) and PARIS to the east systems. The repeater station at MEAUCRS (X-2676) was badly damaged, and much material was unsalvageable.

In all cities, the Communications officers of the Civil Affairs Detachments under G-5 supervision worked closely with the local PTT officials to restore telephone and postal communications with the cities as rapidly as possible. All reported that the cooperation of the French officials was excellent, and that they needed only advice as to the Army priority needs before starting active work.

All work on communications for Third U.S. Army was accomplished by close liaison with the Army Signal officer and his staff. The cooperation was complete and the coordination effective. Close liaison was also maintained with the AC of S, G-2, Security Section, in all matters relating to military security.

Almost every large city had one or more German telephone exchanges. Many of these contained plans of the German and French cable distribution system and were of great value in establishing Army and other military communication. All maps and charts of this type were turned over to the Army Signal officer.

A large German dump discovered in the vicinity of CHARTRES (R-30) which contained a number of anti-aircraft searchlights, mobile power units, photo projection machines and other miscellaneous items, was reported to the AC of S, G-4.

Large quantities of material of use to the Signal Corps both for repair of existing facilities and for the extension of new lines were discovered. Each repeater station had from 200 to 300 meters of cable in the storage yard. This was always of the type needed for the cables passing through the repeater station. At a warehouse in MELUN (S-2506) the following material was found and reported:

86,000 meters of German fourteen pair armored cable.

9,000 meters of German fourteen quad jute-covered cable.

4,500 fir poles, twenty-one feet in length, and quantities of hardware for aerial cable and open wire.

Civil Affairs Detachments reported many freight cars and storage rooms containing radio, telephone, motor generator and other Signal Corps equipment, all of which were reported to the Army Signal officer.

DECLASSIFIED

PUBLIC WELFARE

The lack of widespread devastation in the Army's path eliminated many problems which would have created obstacles to military operations, since the agencies for [illegible] religious welfare agencies, chil[illegible] institutions remained intact and [illegible] had passed. The attention of the [illegible] directed to specific situations wherever [illegible] stall future trouble.

One real problem developed wherever the lines of the Army cut off the Arrondissement and Department from the headquarters which were the normal sources of their funds. This situation was quickly remedied by the French authorities, and at no time were reports received of stoppage of work of the various agencies because of the lack of money.

In the area traversed the problems of furnishing feeding stations and relief agencies with adequate supplies required that arrangements be made to supply local authorities with sufficient gasoline and oil to move their available transport. In most instances arrangements were made to utilise captured enemy gasoline for this purpose.

From analysis of Detachments' reports, and observation of the work of local national relief and welfare agencies, it can be said that the French agencies for assistance and welfare functioned in a manner which made it unnecessary for the military authorities to operate relief programs or provide financial assistance to such agencies. The agencies operating in this field were: Secours National, Croix Rouge Francaise, Bureau de Bienfaisance, Bureau d'Assistance, the local religious institutions, welfare agencies, the Parish Abbe, and the mayors of the various communities. No real destitution was left in areas traversed by the Third U.S. Army. The hardship and suffering which occurred as a result of enemy activity and combat conditions was adequately handled by local authorities.

SECTION VI

GOVERNMENTAL AFFAIRS

As rapidly as conditions permitted, the French assumed responsibility at all levels of government. On 6 August, the French Military Commander of the 10th Military Region issued a proclamation, under the Law of the State of Siege, ordering that no arrests be made in the Department of ILLE-et-VILAINE except for flagrant offences, without the mandate of the Military Authority for the 10th Military Region. Thus the Provisional Government quickly asserted its authority over the area involved. The principal value of the Civil Affairs Section and the Army lay in the prompt exercise of jurisdiction by the French over offences which concerned the security of the Allied forces. The action also clarified the position of Les Forces Francaises Interieures (FFI) already recognised as a component part of the Allied forces, and increased their activity and aid to Civil Affairs Detachments. Soon, throughout the Army Zone, "FFI" members were assisting in traffic control and public safety functions. They gave information of enemy stragglers and concentrations, enemy supplies, native collaborationists, which was forwarded by Civil Affairs to proper Army authorities.

On the civil side, Regional Commissioners (Commissaires Regionaux de la Republique) exercised the powers given under the Laws of the State of Siege, and the power to appoint and remove officials, as and desired by Supreme Headquarters policy. The Prefect, Sous-Prefect, and Mayor at RENNES (X-15), and the mayors at DINAN (X-7694) and FOUGERES (X-3878) were removed.

French officials at all levels with whom Civil Affairs Detachments were required to deal, quickly resumed ordinary functions, and demonstrated initiative in meeting extraordinary problems. Public safety, relief, money and banking required a minimum of aid and supervision by Civil Affairs personnel. The movement and care of refugees, anticipated as a difficult problem, was satisfactorily handled by local officials and agencies in the main.

The early announcement of Civil Affairs objectives and the tact and judgment displayed by Civil Affairs personnel played an important part in reassuring the French as to Allied aims and in encouraging the reassurance of French authority in civil administration. The appropriate action was taken. For example, an Army order was issued on 16 August permitting the movement of civilians, under Civil Affairs control, to harvest crops. Further examples are found in the release of captured medical and other supplies for civilian uses.

LEGAL

A continuous study of legislation enacted by the French authorities was made by the legal sub-section, and Civil Affairs Detachments and staff sections were advised as to that which might affect the Army's interests. Checks were made with the highest civil officials covering matters such as curfew, travel restrictions, civil defense and water conservation, and changes suggested in current regulations where necessary to conform with army policy.

It was soon found that French courts resumed functioning usually with personnel and buildings intact shortly after the passage of combat. This obviated the necessity for the operation of Military Courts. The courts and functioning of the judicial system were observed to insure that persons committing offenses against Army personnel were properly tried, and that sentences commensurate with the offense were imposed. During August, no serious crimes committed by French nationals against our troops were reported. The Juge de Simple police and Gendarmerie enforced those necessary regulations usually by the imposition of fines.

Many questions involving the handling and disposition of captured and abandoned enemy war material arose. These were clarified on 16 August by an Army order that defined the Civil Affairs responsibility to the Army in securing, reporting and disposing of enemy materials of war. As a result, a conference was held with the Commissaire of the ANGERS Region on 19 August at which he agreed to issue a public notice as to the status of all abandoned and captured enemy material in the Region. This was done through the press on 21 August.

FINANCIAL

Reports to the Financial sub-section within a few days of 1 August set the pattern for the fiscal and financial situation as it unfolded through the month. French banks either had not closed or were immediately able to reopen with ample cash to meet any anticipated withdrawals. Enemy accounts were blocked by the French, the supplementary franc was freely accepted everywhere, local authorities had sufficient resources for payroll and relief expenditures. No advances were requested from Civil Affairs. Prices were being maintained at levels equal to or below those current before liberation.

On 2 August sub-accountants were appointed on all Detachments of Company I, 2d European Civil Affairs Regiment. They were issued accounting kits and an initial supply of currency. Visits were made within the next few days to the Detachments in CONCARNEAU (T-2465), GRANVILLE (T-13), LA HAYE PESNEL (T-2528), DAVRAY (T-3061), VILLEDIEU (T-3833), and AVRANCHES (T-21). Currency proclamations had been handed to local officials, banks had reopened except in AVRANCHES which was still under bombardment, and in general there were no pressing financial problems. In no case had the banks been looted; premises were intact and the banks were in liquid condition. Sub-accountants and financial specialists were interviewed in the towns visited and it was made clear to them that their missions could best be served by encouraging the French to proceed with their own financial rehabilitation, by rendering such assistance as might be requested in the way of passes and transportation, and by intervening only in the case of a financial crisis.

Throughout August, items of interest in the fiscal field were extracted from Detachment reports and entered in the daily summary. Bi-weekly reports were prepared summarising developments during the period covered. Again, uniformly, all information received indicated a minimum of financial problems with the French capably taking care of their own needs.

Visits were made to Detachments in RENNES (T-15) and DINAN (T-7694) where also it was found that the situations were favorable. Cash in the Banque de France, RENNES amounted to 1,400,000,000 francs. At DINAN the Banque de France had 170,000,000 francs. At ST. MALO (S-7916), when the citadel was taken, cash of over 2,000,000 francs was intact in the vaults of the Banque de France. Near DINAN was found a depository of the Banque Nationale pour le Commerce et l'Industrie in whose vaults were [illegible] francs in gold coin, sterling

The sub-section reported to Currency Section for FRANCE small amounts of seized or captured currency found by Civil Affairs Detachments and temporarily commingled with Civil Affairs funds. No call was made upon Currency Section for additional funds and receipts from sale of Civil Affairs supplies during the month (estimated at two million francs) by far exceeded the relatively small amount of Civil Affairs expenditures.

Pursuant to authority delegated by the Commanding General, Twelfth U.S. Army Group, an amendment was made to Civil Affairs Instructional Guide covering finance, authorising the opening of bank accounts by Civil Affairs sub-accountants, limiting emergency advances to 50,000 francs to any one borrower, and setting a maximum amount of cash to be retained by the various type Detachments.

Contact was maintained with the Chief Finance Officer, Third U.S. Army, who was kept informed as to Civil Affairs activities affecting his operations. He in turn reported figures on troop spending, which were passed on to higher authority.

The sub-accountant for G-5 Section commenced operations on 1 August with funds of 640,000 francs. During the month receipts amounted to 251,740 francs, while disbursements totalled 448,857 francs. Of these receipts and disbursements, 250,000 francs and 430,000 francs respectively represented routine transfers of funds between sub-accountants. Balance on hand at the end of August was 442,883 francs.

In certain fields related to finance for which plans had been prepared it was found that the French initiative had been adequate and that no action was required on the part of Civil Affairs. Continuation of government pensions and property control measures, reopening of post office savings facilities, and the blocking of enemy accounts fell into this category. In a similar manner, in very few cases were Detachments called upon to provide guards for banking premises as such steps had already been taken by local public authorities.

PUBLIC SAFETY

Eighty thousand proclamations, posters and printed forms were distributed in August by the Public Safety sub-section to Corps and Division Staff sections and to Civil Affairs Detachments. Great numbers of these were printed locally to meet urgent demands from the field. The public notices included the proclamation of the Supreme Commander, civilian circulation restrictions, warnings against pillage, blackout and curfew regulations, currency proclamation and orders to turn in carrier pigeons. In turn, standard exemptions forms or "passes" enabling essential civilian services to continue in limited degree were supplied, as well as identification passes, police and prison warrants, arrest reports, and receipt forms for surrendered articles.

Eight thousand white police arm bands bearing the inscription "MP Police" (Republique Francaise) were obtained largely by local manufacture for the purpose of identifying emergency police appointed to reinforce the Gendarmerie.

The Gendarmerie proved very satisfactory. The vast majority were men who remained loyal to the French Republic, while few in number in the rural areas, were strong in the large centers. This was because the enemy, too, had been forced to rely upon the traditional law enforcement agency of the country. The mobility of the Gendarmes was limited. In rural areas their sole method of travel was by bicycle. Motorcycles, automobiles and bicycles were available in the larger centers, but the motor equipment was of little use because of the lack of fuel. As the Germans had confiscated all weapons and ammunition, the Gendarmes in some cases were armed only with clubs.

Auxiliaries wearing the "MP Police" arm band were appointed in the first emergency by the mayors and used mainly in helping the Gendarmes handle traffic, circulation and civilian defense measures. Later the authority for these appointments was taken from the mayors and given to the Prefectures of police, upon request of the Forces Francaises Interieures. As rapidly as possible, both Auxiliaries and Gendarmes were armed. The civil police aided materially in preventing civilians from interfering with the movements of the Army.

Crime on the part of the civil population was an [illegible] cause of [illegible]

Digitized by Google

Notices restricting civilian travel were posted on all highways and in all towns and villages. They were signed by the Regional Commissioner and generally limited civilian travel to a radius of six kilometers outside of division areas, where the division commander fixed the limit. Enforcement was effected through the Military Police, Civil Affairs detachments, the civil police, and roadblocks. Passes permitting wider travel were issued, with fee exemptions, to physicians, clergymen, and French officials on vital missions.

In the Army Area, refugees were permitted on non-military roads to return home. Civilian vehicular traffic was kept off all military routes that had been designated as of primary importance.

Curfew hours were set by the Area Commanders. The population obeyed wholeheartedly, feeling the curfew lifted as compared to the German restriction. Blackout was rigidly enforced through the civil police.

PUBLIC HEALTH

There were no opportunities for procurement of exhaustive public health data. Stress was placed upon meeting problems as they arose and assisting the French to restore their own services.

Only twenty-eight cases of diphtheria and ten cases of typhoid fever were reported in a population area of 225,486 people. These were sporadic cases reported from rural areas. A flare-up of diphtheria occurred in QUEUDE LE MANCHE (M-3642) where fifteen adult cases were reported. Diphtheria anti-toxin was provided from Army and local sources. The situation was quickly placed under control. Cutaneous anthrax was reported as a result of spreading disease amongst the animals in the area of ST BRIEUC (U-2304). An attempt to provide propylactic serum for the animals was made.

The disease most commonly reported, especially among refugees, was scabies. Control was usually adequate in the hands of Civil Affairs Detachments and local medical personnel. Assistance in Public Health problems uncovered by Civil Affairs Detachments was facilitated by Public Health surveys and epidemiological reports submitted by them.

There was no marked depletion of professional personnel. Damage or depletion of medical facilities was not serious. In instances where hospitals were damaged or destroyed alternative arrangements were adequate to meet the needs. In most places there was a surplus of bed space in hospitals and clinics.

On the whole the expected drastic shortage of medical supplies never materialized. Demands upon civil affairs were for small quantities of medicinals only. Supplies most commonly sought included antiseptics, anesthetics, syringes, bandages and dressings, narcotics, barbiturates, insulin, biologicals and soap. These calls for supplies were occasionally met by requisition from captured enemy stocks.

Only one Allied Relief Board (ARB) Basic Medical Unit was issued, and that for the Department of FINISTERRE, the distribution point for which was located at QUIMPER (M-2054); and this unit contained many items not needed by the Department. Arrangements were made to meet requirements for biologicals by storing them in a hospital in RENNES (T-15).

As of 31 August, 890 civilians had been admitted to military hospitals, thirty-six remaining for further treatment. Most of the cases were fairly serious and due to accidents, gunshot wounds and land mines. As rapidly as was feasible, these patients were transferred to civilian hospitals in accord with the policy of utilizing them to their fullest extent.

The nutritional status of the people was excellent. No evidence of deficiency disease was discovered. Food was plentiful. Refugees were fed, with few exceptions, from local food supplies by local officials.

Water supplies were damaged to varying degrees, the distribution lines in towns suffering most. All but a few plant installations escaped damage entirely, but the lack of electrical power made it necessary to improvise ways for pumping water. Sewerage systems were damaged severely but it was difficult to evaluate the destruction because of the curtailed water consumption. Public Health Specialists assisted in the reconstruction of these utilities wherever possible serving in advisory capacities and helping to locate materials for repairs.

CHAPTER 4
SEPTEMBER OPERATIONS

SECTION I

GENERAL

Confidence in the French and understanding of their views and methods grew during the Army's rapid advances in the first half of September. This was fortunate. Civilian problems multiplied as the Army drew nearer to the German border. Perfect coordination with the French authorities was mandatory if confusion was to be avoided.

The Relief and Supply Branch assumed a major role, serving as the intermediary in the disposal of thousands of tons of captured German foodstuffs and a wide variety of other materials. These ranged from lumber and coal to blankets and troops. The goods jammed warehouses, filled the cars of abandoned trains, and in some instances were hidden in underground caverns. Excavated storage tunnels at THIONVILLE (F-7664), containing many thousands of tons of enemy goods, were more than twenty-five miles in length.

Large quantities of the enemy stocks were useful to the Army, but larger portions were released by the Quartermaster and other services to G-5 for sale to civilian authorities. These sales aggregated millions of francs. They were usually consummated on the spot without an instance of friction.

At the same time, the Relief and Supply Branch became an exchange agency for the shifting of large stocks of goods from one part of the country to the other. The Prefect at ORLEANS (M-64), needing 40,000 gallons of diesel oil for his Department's harvests, was referred by Civil Affairs to the Prefect at LENS (U-4886). PONT-L'EVEQUE (U-2891) was referred to LENS for flour. LENS shipped 100 carloads of coal to PARIS under Civil Affairs supervision. Another 153 carloads of coal, sold to REIMS (T-38), went likewise for the relief of the French capital.

Lacking inter-city wire communications and facilities for the prompt exchange of information, French authorities would have been seriously handicapped in their relief efforts but for this assistance by Civil Affairs Supply officers. The Army also profited by prompt liaison between Civil Affairs detachments and G-5 Supply. At ORLEANS (M-64), for example, 7,300 gallons of high-test gasoline was discovered by the detachment Supply officers in a weed-overgrown underground tank. Through G-5, the gasoline was reported to the Army Quartermaster in time to turn over the entire cache to the 6th Armored Division then moving through the city.

Displaced persons loomed as an increasing problem with the approach to the border. On the night of 12-13 September, 150 homeless men and a few women and children were housed and fed at VERDUN (U-26) by Civil Affairs personnel. The number was 1,500 by the fifteenth, 2,200 by the seventeenth, and hundreds more were moving in scattered groups along the roads toward safety in the rear. Dirty, poorly clad and hungry, they were of thirty nationalities but chiefly Ukranian Russians. The bulk of them had been forced workers in German war industries. Many had been German prisoners of war.

Detachment D3 of Company C, 2d European Civil Affairs Regiment, was dispatched to MAYENCE (U-7783), in the THIONVILLE (U-88) industrial district, on 13 September to control the rearward flow of these victims of war. It was the first Detachment ordered to duty in ALSACE-LORRAINE.

By 20 September four centers housing 1800 displaced persons were in operation at MAYENCE (U-7783), 400 persons were being cared for at ETAIN (U-4770), and 150 at BRIEY (U-6973). Three days later, a center for 1200 was opened at LONGWY-PIENNE (U-1983), and still another at PAGNY-sur-MOSELLE (U-7444). On 24 September, 6000 displaced persons were receiving emergency feeding. Fifteen truck loads of food, soap and cleaning equipment were dispatched from G-5 warehouses on that day.

At VITTEL (Z-6757), an unusual problem arose. More than 2200 Allied nationals had been interned there in wire-barricaded hotels since early in the war. Of these, 361 were United States citizens, 1150 were British and the others claimed citizenship in twenty-nine nations. A Detachment was placed in charge at VITTEL.

Transportation by now was an acute Civil Affairs need. It was met by the attachment to G-5 Relief and Supply Branch of 100 U.S. Army trucks of one ton capacity and 100 one ton trailers. Manned by 25% uniformed Frenchmen under ten French Army officers, the truck train reported at VERDUN (U-26) on 22 September loaded with 225,000 pounds of imported foodstuffs hauled from NORMANDY beaches. The train was organized into two evenly sized transport companies, one for general relief work directly under G-5 supervision, and the other for allocation as needed to Civil Affairs Detachments in the field.

The entry of Civil Affairs Detachments into ALSACE-LORRAINE, long a region of contention between FRANCE and GERMANY, presented the prospect of problems in government not encountered before on the continent. Three departments of the region -- HAUTE-RHIN, BAS-RHIN and MOSELLE -- had been incorporated into the REICH and German governed since 1940. Most of the loyal French population had been driven out, German immigrants moved in. Then, with the approach of the Americans, the Germans had been evacuated in large numbers.

Conferences with French liaison officers attached to G-5 developed that, as a policy, it would be necessary to set up wholly new governments in the three departments, which were to be regarded as still being an integral part of the French Republic.

Ahead was GERMANY. Seventeen Military Government Detachments of the 2d European Civil Affairs Regiment, each trained for duty in a specific German locality, were attached to Third Army on 21 September. An additional nine Detachments reported 24 September. The total strength of these twenty-six Detachments of Military Government troops destined for GERMANY was 133 officers, seven warrant officers and 235 enlisted men.

SECTION II

PERSONNEL AND ADMINISTRATION

Experience in the field led to the reduction of the G-5 Staff to twenty officers by the transfer of five specialists to European Civil Affairs Division for reassignment.

Rapidly changing Army boundaries, plus the difficulties inherent in making technical surveys in an active zone of operations, proved that specialist officers have neither the time nor opportunity to operate effectively with an Army staff and belong more properly in rear areas that are becoming stabilized. The exceptions are those specialists, such as public health, safety, fiscal and legal officers, capable of immediate action in emergencies threatening the health or security of troops, and involving decisions on property and government.

Numerous directives, ordinances, proclamations and handbooks relating to Military Government in GERMANY were distributed. Preparations for movement into GERMANY were largely completed.

SECTION III

INTELLIGENCE

More than 1,200 reports from Civil Affairs Detachments and staffs operating in the field were funnelled through the Intelligence Branch in September, analysed, excerpted, and routed to responsible Army staff officers for their information or action.

Intelligence, in turn, issued thirty Daily Summaries of Civil Affairs operations, six weekly bulletins and analyses, two fortnightly reports to Twelfth U.S. Army Group, four memoranda for the information of the Chief of Staff, a running historical narrative for G-5 of Supreme Headquarters, and a complete two-volume review of operations from activation to 30 September.

SECTION IV

PLANS AND OPERATIONS

Detachments operated in the following localities in September:

ANGERS (U-8279)	NANCY (U-8512)
BAR-le-DUC (U-1122)	NANTES (U-0560)
BRIEY (U-6873)	NEUFCHATEAU (Z-4975)
CHALONS (T-5445)	ORLEANS (M-6340)
CHARMS (Z-9476)	PAGNY (U-7444)
CHAUMONT (Z-0709)	PONT-a-MOUSSON (U-7635)
CHATEAULIN (M-2375)	PONTIVY (L-0455)
CINQ-MARS (P-5804)	QUIMPER (M-2054)

VIONVILLE (U-6957)
VITTEL (Z-6757)
VITRY (T-6819)

DECLASSIFIED

Change over to the new operational plan was accomplished as directed. Approximately nine Civil Affairs Detachments were made currently available to each Corps. Any Detachment, deployed and left to come directly under Army control with a change in Corps rear boundaries, was, as soon as practicable, returned to the Corps under which it previously operated. It was directed that Detachments, once deployed, were not to be moved without authority of this headquarters.

By orders of Twelfth U.S. Army Group, Army was directed to leave Detachments in all Departmental and Regional Capitals as the army rear boundary moved forward. The following seven Detachments were designated, also as per orders from Army Group, for displaced persons duty along the French border and in GERMANY: C2C2, C2B2, C1I2, C2D2, D1B2, D2B2 and D2D2.

By General Order, Headquarters, European Civil Affairs Division, dated 12 September, Detachment designations were not changed but companies of the 2d European Civil Affairs Regiment were redesignated as follows:

Old designation	Redesignated as
Co A, 2d ECA Regt	Co G, 1st ECA Regt
Co B, 2d ECA Regt	Co B, 1st ECA Regt
Co C, 2d ECA Regt	Co M, 1st ECA Regt
Co D, 2d ECA Regt	Co E, 1st ECA Regt
Co I, 2d ECA Regt	Co I, 1st ECA Regt

On 21 September, the following Military Government Detachments and administrative company headquarters, all specially trained for duty in GERMANY, reported to this Headquarters and were bivouacked in the vicinity of ETON (V-5175):

Detachment	Predetermined Destination
Hq Co A, 2d ECA Regt	SAARBRUCKEN (Q-4570)
HIA2	SAARBRUCKEN (Province)

I6B2	BENSHEIM and GROSS-GERAU (M-5447)
I7B2	ALZEY (M-2727) and BINGEN (M-1152)
I8B2	DIEBURG (M-7945) and ERBACH (M-9115)

Subsequently, all twenty-eight Military Government Detachments and company headquarters were moved to billets at JOUDREVILLE (U-5878).

Toward the end of the month, the boundary between First and Third U.S. Armies, on Third Army's left, was moved to the north to include part of the Duchy of LUXEMBOURG, where were located the following Detachments which had been deployed by First U.S. Army:

Unit	Location
A1C1	LUXEMBOURG (P-8413)
H1F1	LUXEMBOURG (P-8413)
B1B1	ESCH (P-7301)

Though still formally attached to First U.S. Army, these Detachments were instructed to submit reports to Third U.S. Army through AC of S, G-5, XV Corps.

The XV Corps, operating on the Third U.S. Army's right flank, passed to the control of the Sixth U.S. Army Group on 28 September. Of the nine Detachments available to XV Corps, five were ordered returned to Third U.S. Army and four were left available to XV Corps, although still formally attached to Third U.S. Army. The AC of S, G-5, Twelfth U.S. Army Group, was requested to adjust this situation.

G-5 Rear Echelon, now constituting all of G-5 Section except three officers and three enlisted men with the Forward echelon, had now moved through FRANCE as follows:

MEMOU (O-1898)	15 July
BEAUCHAMPS (Y-1093)	3 August
POILLEY (J-3391)	10 August
ST SABINE (Z-3352)	17 August
COURCY (R-8811)	27 August
L'EPINE (T-6147)	6 September
ETAIN (U-4770)	18 September

REFUGEES AND DISPLACED PERSONS

Displaced persons were reported in the following numbers for the weeks indicated:

Week Ending	Number of Displaced Persons Reported
4 September	950
11 September	1,232
18 September	8,081
25 September	13,274

The refugee problem, on the other hand, diminished during the month. Local French authorities showed an increasing ability to absorb such French civilians into towns and to provide for them.

In accord with the objective of keeping civilians off military routes, Displaced Persons Centers were established during the month at VITTEL (Z-6757), VERDUN (U-26), BRIEY (U-6873), HAYANGE (U-7783) and PIENNES (U-5983). Displaced persons were hauled to these camps where food and shelter were provided. VITTEL differed from the usual Displaced Persons Center in that the [illegible]

The number of displaced persons at the various centers at the end of the third week was as follows:

Displaced Persons Center	Number of Displaced Persons
VERDUN (U-26)	2,336
BRIEY (U-6873)	550
HAYANGE (U-7783)	2,201
VITTEL (Z-6757)	2,087
PIENNES (U-5983)	Being established

The number of camp residents fluctuated from day to day. The nationality grouping, aside from VITTEL, showed a preponderance of Russians, Ukranians, Poles and Jugoslavians. Other nationalities represented were Spanish, Italian, Czech, and Dutch. Many of the residents, particularly at HAYANGE and BRIEY, formerly had worked in the mines in those areas.

The organization of these camps followed, in the main, the pattern recommended in "Guide to Assembly Center Administration" Civil Affairs/d9, Supreme Headquarters Allied Expeditionary Force, with certain adaptations to suit local conditions.

Civil Affairs Detachments were assigned the task of establishing, organizing and supervising these centers, with the expectation, however, that the French authorities would eventually assume full responsibility.

A French Liaison officer (Ministere des Prisonniers de Guerre Refugies et Deportes) was sent to each of the camps to assist Civil Affairs Detachments in linking the camps with the local authorities. In addition, French teams, (Mission Militaire de Liaison Administrative) each consisting of five French women specially trained in refugee and displaced persons work, and a male driver were deployed to assist in the supervision of the camps at VERDUN (U-26), BRIEY (U-6873), HAYANGE (U-7783) and PIENNES (U-5983). These French teams are also under Third U.S. Army control. Similarly, five American Red Cross representatives were attached at BRIEY and eight to VITTEL (Z-6757).

Food and supplies for the camps were furnished from local sources, supplemented where necessary by German captured stocks and by imported relief supplies.

The camps proved of assistance in stabilizing what would otherwise have constituted a moving population. Moreover, Civil Affairs Detachments supervising the camps learned valuable lessons applicable in handling similar problems in GERMANY.

Preparatory to future operations, the sub-section requested that space for Displaced Persons Centers be reserved at ERROUVILLE (U-6728), MORFONTAINE (U-6197) and DONCOURT (U-6962). Military barracks existed at each location capable, if necessary, of accommodating about 3,000 persons. Space also was requested at LERRAYON (U-4697) where there were a Gendarmerie barracks, hospital building and military barracks with a combined capacity of about 3,000 persons. Possible camp sites investigated at COMMERCY (U-4320) where the Caserne Oudinot and Quartier Marguerite combined were capable of housing 4,000 persons. A need was indicated for a center in or near METZ (U-85).

SECTION V

RELIEF AND SUPPLY

Due to the rapid movement and the consequent priority on transportation required for the tactical forces, it was not possible to bring forward to Army depots imported relief supplies held in Communications Zone dumps. As a result relief supplies sold to French authorities in areas of need, during the first three weeks of September, were obtained solely from captured enemy supplies released by Army G-4 and Quartermaster to Civil Affairs for this purpose. Transactions were made by Civil Affairs Detachments on the spot with French authorities, who arranged for equitable distribution through civilian agencies with civilian transportation.

The release of these supplies by Army G-4 and Quartermaster for Civil Affairs use was coordinated by the Relief Supply sub-section. On 5 September the branch issued an Operational Supply Instruction entitled "Disposition of Captured Enemy Materials." This instruction outlined a uniform system [illegible]

Digitized by Google

The following list of supplies and quantities represents such transactions carried out by Civil Affairs Detachments with French authorities in the Zone of the Army during the month:

Diesel Oil	49,000 gals.	
Gasoline	90,750	"
Kerosene	750	"
Coal	13,400	tons
Wood, fuel	220	"
Foodstuffs, assorted	10,352	"
Bread, loaves	13,600	"
Grain and Oats	15,000	"
Cement	1,175	"
Cement	1,875	bags
Stoves	2,500	each
Shovels	1,000	"
Beaverboard	2,500	pieces
Fire extinguishers	1,400	each
Buckets, galvanised	8,000	each

In anticipation of supplies needed for Refugee Centers and Displaced Persons Camps, a request was made 15 September to G-5 Section, Twelfth U.S. Army Group and requisitions were submitted to Commanding General Communications Zone; for 225,000 pounds of imported relief supplies to be brought forward from the beaches. A Civil Affairs Supply Depot was established in the Citadel, VERDUN (U-26), 18 September and was activated 22 September with the arrival of the 100 trucks and trailers carrying the following:

Flour	134 lbs.	bags	100
Pulses	114 "	"	50
Fats	75 "	case	100
Biscuits	76 "	"	50
Canned Meats, assorted			
Milk, evaporated			
Vitaminised Chocolate	90 "	bags	250
Sugar	62 "	"	200
Fish	66 "	case	250

In addition to the imported relief supplies in the Civil Affairs Supply Depot, the following captured enemy supplies were stocked:

Flour	175 bags
Soups, dehydrated	250 cases
Biscuits	320 cases
Pulses	140 bags
Soap	200 cases
Brushes	1,500 each
Brooms	500 each
Kitchen utensils, assorted	90 each

Civil Affairs Detachment D602 was assigned to handle the Supply Depot and Transportation Pool. Food supplies were forwarded from the Civil Affairs Depot to the Displaced Persons Centers at VERDUN (U-26), VITTEL (Z-6757), BRIEY (U-6873), FLEVILLE (U-5983), PAGNY (U-7444), and the five Centers in MATANGE (U-7783).

Transportation of local surplus supplies from areas of plenty to areas of need was accomplished by agreement between Civil Affairs Detachments and French authorities. At the end of the month trucks from the Civil Affairs Transportation Pool moved 370 tons of civilian-owned flour from VERDUN (U-26) to NANCY (U-81) where a critical shortage existed. In another area where a shortage of bread existed, a Civil Affairs Detachment arranged with bakers in surrounding communities to bake extra quantities to help the needy areas.

Civil Affairs Detachments at Displaced Persons Centers, with transportation furnished by the Civil Affairs Transportation Pool, built up stocks of local food resources in their respective areas for feeding their charges. Supplementing these local resources were the relief supplies furnished from the Civil Affairs Supply Depot.

Reports of captured enemy supplies received from Civil Affairs Detachments in the forward areas were forwarded to G-4 for distribution to the interested army services. Vast quantities of such materials were taken over and used by the Army Engineers, Signal Corps, Quartermaster, Medical Corps and Ordnance. Several carloads of new German airplane motors and parts and various other air Corps items, reported to G-4 were passed on to the Air Forces. Approximately 9,000 tons of engineer and construction material was reported. The larger part of these materials now needed in any army operations were turned over by G-4 to the Communications Zone for salvage and rehabilitation or utilization in the rear areas.

In sixty-nine cases farms owned and operated by the Germans, each with crops, cows, horses and farm equipment, were reported to G-4, which forwarded the reports to Communications Zone for action.

At CIREY-sur-MAUX (Z-5864) enormous quantities of enemy supplies, including foodstuffs, cigarettes, wines, and clothing were found in caves that covered an area of approximately thirty-five kilometers. Civil Affairs Detachment D322 was assigned to provide adequate guard and take a complete inventory of all stores. During the stay of this Detachment 5,780 tons of food supplies were issued to combat forces of the army, and 5,012 tons were issued to units of the French Army. On 21 September CIREY-sur-MAUX reverted to the Local base section of the Communications Zone, and the Detachment was relieved. It was estimated there were sufficient foodstuffs alone stored in these caves to feed a United States Army Division for a full year.

TRANSPORTATION

Activities for the month included the establishment of Civil Affairs Transport Pool, execution of hauling missions, salvage of captured enemy vehicles, supervision and operation of 24 European Civil Affairs Division Transport Platoon, supply of equipment and drivers to Corps liaison officers, and liaison with French rail and water transport systems.

During the first three weeks, care and transport of refugees and displaced persons became a major concern. Supplies of food, beds, clothing, stoves and other necessities for the establishment of five Displaced Persons Centers required collections from widely separated sources and movements to selected locations. This was accomplished almost entirely with five captured German trucks rehabilitated by the Civil Affairs Transport Platoon, and by drivers from the G-5 motor pool. By this means more than 2,000 refugees and displaced persons were collected from towns, villages, roads and collection points and transported to camps; in addition for five days a continuous road patrol was maintained in the vicinity of CLAIR (U-4770), to round up civilian stragglers.

Likewise captured enemy food supplies were picked up at various points and transported to the VERDUN (U-26) Civil Affairs Supply Warehouse from which all Civil Affairs Detachments and Civil Affairs Displaced Persons Centers in the area could draw. Following the establishment of the Displaced Persons Centers, they were entirely supplied by Civil Affairs transport.

The Civil Affairs Transport Pool was established 22 September with 100 one-ton trucks and 100 one-ton trailers. Two companies of French troops, commanded by ten French army officers, comprised an enlisted personnel of 220 drivers, assistant drivers, guards and repair men. Quarters for the Civil Affairs Transport Pool were obtained by taking over the Citadel in VERDUN (U-26) which also housed the Civil Affairs Relief Supply warehouse, and direction of both was assigned to Detachment D602.

In eight days following their arrival the trucks performed twenty-eight missions, ranging in size of convoy from a single truck and trailer to fifty trucks and trailers. Over 600 tons of supplies were transported into and out of the Civil Affairs warehouse; 121 displaced persons, american and british citizens, were transported from VITTEL (Z-6757) to PARIS. Thirty-seven trucks and trailers were loaned to Displaced Persons Centers for periods varying from two to seven days to move displaced persons and refugees and to haul local food supplies from surrounding areas. More than 370 tons of flour were moved from VERDUN (U-26) to NANCY (U-81).

The salvage of enemy vehicles continued, although at a somewhat slower pace, as fewer abandoned vehicles were found and those located were badly stripped. However, reconnaissance trips for the purpose of locating enemy vehicles were made to twenty-three towns. Sixty assorted tires and twenty tubes were obtained for use on enemy vehicles through the efforts of the Detachment at VERDUN (U-26). A total of twenty-four enemy vehicles were located and salvaged, including four trailers.

Five large captured enemy trucks were salvaged and added to the G-5 Headquarters pool. United States registration numbers were obtained on sixteen captured enemy vehicles which had been previously salvaged and turned over to Civil Affairs Detachments. Registration numbers were requested for fifteen more, some of which had been salvaged by the Civil Affairs Detachments themselves.

The 24 European Civil Affairs Division Transport Platoon was attached to G-5 early in September. It was moved to the vicinity of Army G-5 Section and given three major functions: repair and maintenance of Civil Affairs vehicles, salvage and rehabilitation of captured enemy vehicles, and maintenance of a rendezvous point for unassigned Civil Affairs Detachments attached to Army, including their messing and billeting.

During September the Platoon boarded and billeted nine Civil Affairs Detachments for periods ranging from two days to the entire month; it gave 1,000 and 5,000 mile checks to twenty-seven vehicles, repaired thirty-six vehicles, rehabilitated nineteen captured enemy vehicles, and also supplied occasional transportation and drivers to liaison officers, Detachments and Army G-5 Section.

Large quantities of rolling stock were located and reported to G-4, including one railway car repair shop, more than 1,600 freight cars of all types in usable condition, nineteen usable locomotives, and forty engines damaged but repairable.

Continuing the effort to make water routes available to the Army, numerous canals were surveyed by Civil Affairs Detachments and staff officers to see if they could be used or repaired for movement of Army, Civil Affairs or civilian supplies. Without exception the waterways were found unusable and it was estimated six months to a year would be required to put them in operation. The poor condition was due to neglect of banks and silting-up of channels, damage to locks by sabotage and bombings, debris of bridges and buildings and sunken barges blocking channels, and in many cases failure of the water supply because of lack of power for pumps. There was a definite lack of boats. Less than twenty barges were located, the great majority in poor condition and without motive power.

Railroad transportation also was given attention. Working through French authorities, and using local labor and materials, large stretches of railway right-of-way were repaired and put in use: NEUFCHATEAU (Z-4975) to RAINCOURT (Z-7869), BAR-le-DUC (U-1122) to PAGNY (U-7444), BAR-le-DUC to TOUL (U-6410), TOUL to NANCY (U-81) and many small stretches of track between neighboring towns.

COMMUNICATIONS

Telephone service in the Army net was provided through the Signal Corps for the Detachments at BRIEY (U-6873), CHALONS (T-5445), COMMERCY (U-4320), NANCY (U-81), ST. DIZIER (T-9408), VERDUN (U-26), the refugee centers at BRIEY and VERDUN, the Civil Affairs Transportation Pool at VERDUN, and Civil Affairs Companies A and B scheduled for GERMANY. These were the only organizations accessible to military switchboards.

French PTT (Post, Telephone and Telegraph) long-distance circuits, damaged by military action, were found connecting several cities in which military communications centers were located. Local French labor, with passes from Civil Affairs Detachments permitting circulation, repaired many such circuits needed by the Army. Six circuits, stretching approximately sixty-five miles from VALMY (T-9578) to JOINVILLE (Z-0861), and six more from NANCY (U-81) to LUNEVILLE (Q-0801), were restored by "PTT" workmen. Work progressed on the repair of an additional six from NANCY (U-81) to ARNAVILLE (T-7647).

The restoration of communications for essential civilian activities became necessary to obtain effective assistance from the French civilian authorities. At the instance of G-5 Section, with the cooperation of the Army Engineer, G-2 and Signal Corps, measures were put into effect to expedite the resumption of civil enterprises essential to the Army, such as banks, highway repairs, railroads, civil administration and power distribution.

On 9 September Civil Affairs Detachments, with the assistance of the Counter-Intelligence Corps and local French authorities, were authorized to restore intra-city telephone service for essential civilian activities, and intra-city postal service for all civilians as soon as local conditions permitted. Previously, authority from Army level was required for each individual case. Civil Affairs Detachments, with the same cooperation, restored postal and telephone service within the following cities:

BAR-le-DUC	(U-1122)	EPERNAY	(T-1268)	REIMS	(T-3080)
BRIEY	(U-6873)	ETAIN	(U-4770)	ST. DIZIER	(T-9408)
CHALONS	(T-5445)	MATANGE	(U-7783)	ST. MIHIEL	(U-1934)
CHAUMONT	(Z-3709)	NANCY	(U-8512)	TROYES	(T-2873)
COMMERCY	(U-4320)	NEUFCHATEAU	(Z-4975)	VERDUN	(U-2865)

Inter-city telephone communications and wire signal systems for railroads were authorized on 11 September. These were permitted for official use only, to make it possible to handle dispatching, routing and other functions necessary to operations.

Certain telephone circuits were authorized from the office of the "PTT" Chief Engineer, CHALONS-sur-MARNE Region, to specified "PTT" officials throughout the region. These circuits were to be used to

Digitized by Google

coordinate the repair and maintenance of circuits required for military use and to prevent work on civilian lines that might interfere with Army circuits.

To coordinate the distribution of power throughout the French electric grid, power companies were authorized to use voice carrier systems on high tension wires, supplemented by circuits leased from the "PTT" when necessary.

Courier service between cities [illegible] exclusively essential civilian [illegible] service was [illegible] with the assistance [illegible] French officials [illegible] the following maximum security.

DECLASSIFIED

The security of electric power facilities used by the Army became increasingly a problem as the Army moved into areas at least where parts of the population were possibly hostile. In view of this, discussions were held with the Army Engineer, G-2 and Army Signal Officer, and with the AC of S, G-5 and Signal Corps of Twelfth U.S. Army Group, concerning the personnel and methods to be used in assuring military security on power grid voice carrier systems in the area bordering GERMANY.

SECTION VI

GOVERNMENTAL AFFAIRS

Upon the establishment of the French Provisional Government in PARIS, control of French civil administration again came from the Capital of FRANCE. The government was very active in appointing new officials and disposing of those who served the Germans.

In forward areas the Forces Francaises Interieures (FFI) was of great assistance in removing collaborationists and replacing them with trustworthy officials. Many collaborationists were incarcerated by the "FFI" but in general, their disposal was expedited by the national administration and presented no problem.

During this period a small portion of the Duchy of LUXEMBURG came under control of the army. Officials were quickly installed to replace those with Nazi tendencies. The Supreme Headquarters Mission for LUXEMBURG entered the Duchy soon after its liberation and assumed responsibility for Civil Affairs.

On 25 August Supreme Headquarters issued a "Revised Directive for Civil Affairs Operations in FRANCE," which made Civil Affairs policies conform with the agreements concluded by the UNITED STATES and GREAT BRITAIN with the French Provisional Government, and established clearly the powers of each in zones of operation.

LEGAL

Study was continued of all legislation enacted by the French authority to insure that the policies of the Supreme Commander were carried out. Many claims against the UNITED STATES were investigated and recorded for action by the Claims Section of the European Theater of Operations.

The sub-section was confronted with cases involving escaped allied prisoners of war who had committed offenses against the French civil authority. Investigation was made and reports rendered to Army Group in furtherance of the French Allied Agreement to the effect that French Courts would have no jurisdiction to place on trial members of the allied Forces.

As the army approached German soil, various proclamations, laws, ordinances and notices setting up Military Government in GERMANY were distributed to Corps and Division Staffs. Military Government detachments assigned to the Army were instructed as to the procedure in Military Government Courts and the function of Legal officers in supervising the German Courts and their officials, if and when the German courts were allowed to function.

FINANCIAL

As of 1 September an order was transmitted to Civil Affairs Staffs and Detachments to discontinue the issue and posting of Currency Proclamations in French territory. This was a further indication that French authorities were assuming full responsibility for currency issue in line with agreements among respective governments.

The outstanding development during September was the uncovering of territory in ALSACE-LORRAINE which had been annexed by the REICH in 1940. All banks were branches of German institutions and the German mark circulated exclusively as the medium of exchange in the Departments of MEURTHE, BAS-RHIN, and HAUT-RHIN. Under authority from higher headquarters, the Financial sub-section arranged for distribution to local public officials, and through them to the population, of a proclamation issued by the French Government. This proclamation announced that allied troops would be spending French francs in these areas and that they should be accepted by the population at the provisional rate of fifteen francs equal one mark. This rate tended to cause some confusion when an announcement was made subsequently that UNITED STATES finance officers were prepared to exchange dollars for marks in German territory at the rate of ten marks for one dollar, roughly equivalent to five francs per mark. It was recognized, however, that the French were acting within their rights in the interest of inhabitants of ALSACE-LORRAINE whose liquid resources were expressed entirely in marks.

Reports were received from Civil Affairs Detachments continuing to reflect satisfactory financial conditions in towns uncovered, with the exception of those in the German section of ALSACE-LORRAINE where no banks were able to operate both because their assets were entirely in marks and because in many cases they had been looted by the departing Germans.

The Financial sub-section reviewed August accounting reports from thirty-seven Civil Affairs Detachments and forwarded them with appropriate comments to the Controller of Finance and Accounts at Twelfth U.S. Army Group. Expenditures of Detachments were small whereas substantial amounts were realized from the sale of imported or captured supplies. The sub-section chief, in his capacity as sub-accountant for G-5, Third U.S. Army, distributed 250,000 francs to Detachments going into operation and withdrew surplus funds of other Detachments of 1,140,000 francs. This sub-section's balance on hand at the end of the month was 1,332,773 French francs, in addition to 200,000 Allied Military marks to be held as a reserve for the operations of Detachments in GERMANY.

The arrival in the Army Area of twenty-eight Detachments destined for points in GERMANY necessitated preparations for their further training and coordination for activities in the financial and property control field. Technical manuals and accounting forms were delivered to these Detachments and meetings were arranged with financial specialists and sub-accountants to outline their duties and responsibilities.

Close contact was maintained with the Army Finance Officer, with special emphasis on the currency and rate of exchange problem in ALSACE-LORRAINE, LUXEMBOURG and GERMANY which might be expected to affect American troops.

PUBLIC SAFETY

The state of law and order continued good. No complaints were received of riots, disturbances or offenses against the armed forces by civilians.

A uniform curfew hour at 2130 was ordered, and all Detachments were notified. At LUNEVILLE (G-0801), 108 members of the Forces Francaises Interieures were assigned to assist in the control of civilian circulation. Forty additional rifles were obtained by Civil Affairs to arm these men.

No serious fires were reported.

A French Passive Air Defense team, with transportation and equipment was formed at [illegible]

The large concentration of displaced persons of varied nationalities in the Assembly Center at VERDUN (U-26) and the presence of alleged collaborationists in some of the groups, developed frictions and threatened disorder. Public Safety arranged, through the Provost Marshal, for forty armed guards to police the center. At MAYENCE (U-7703), the Gendarmerie and Forces Francaises Interieures were used to maintain order among unemployed steel workers.

PUBLIC HEALTH

Public Health problems were mainly concerned with Displaced Persons Assembly Centers. A French medical liaison officer was attached to the G-5 Section to assist in Public Health problems, particularly in relation to displaced persons. It was arranged to have French medical supervision of all Displaced Persons Centers as they were established in the Army Zone.

The principal problem of the centers was the hygiene of the inhabitants and sanitation of the establishments. Corrective measures were directed toward organization of sanitary details, provision of sanitary and medical supplies. A preliminary survey showed that there were only three percent louse-infested persons in these camps, necessitating no disinfestation procedures. "DDT" powder, however, was not available for general issue, but was procurable for delousing only when typhus fever was reported. Communicable disease problems were negligible.

Local health facilities continued to be adequate. No shortage existed in medical supplies which were furnished through requisitions on the Army Medical Supply Depot and charged to Civil Affairs. Critical items, such as biologicals were requisitioned from Communications Zone to replenish supplies furnished in emergencies by these depots.

Allied Relief Board (ARB) Units proved too large for meeting emergency medical supply needs. Therefore a drug sub-unit was augmented by dressings and other items and small "dispensary units" were set up. When a Displaced Persons Center was established, the dispensary was furnished with one of these units. Depletions were met from the medical depot established by the G-5 Section. Requests for small amounts of medical supplies from civil health agencies were also met from this depot.

Although emergency requests for biologicals were honored by the Army Medical Depot, the Pasteur Institute in PARIS had sufficient stocks to meet civilian demands.

From 1 August to 1 October, 1,374 civilians were admitted to military medical establishments. During September, admissions numbered 469 but as of 30 September only 64 civilians remained in military hospitals. Commanding officers of military establishments were requested to inform the nearest Civil Affairs Detachment concerning civilians admitted to their hospitals so that transfer to civilian hospitals might be expedited. To facilitate the location of wounded civilians and to gather statistical data, a compilation of all civilian wounded in the Army Zone was initiated from reports submitted by medical installations to the Casualty Section of the Adjutant General's office.

There was no nutritional deficiency as far as could be ascertained.

Diphtheria and typhoid fever continued to be endemic. Twenty-three cases of diphtheria and twenty-three cases of typhoid fever were reported during the month for a population of 1,666,997 people. Other diseases being reported, without alarming significance, were poliomyelitis, scarlet fever, dysentery, paratyphoid fever, syphilis and gonorrhea.

Epidemiological data regarding typhus fever was uncovered that was of possible scientific value. [illegible]

CHAPTER 5
OCTOBER OPERATIONS

DECLASSIFIED

SECTION I

GENERAL

The generally stabilized Zone of Operations occupied by the Army in October presented a difficult problem in civilian government. The Zone embraced the most heavily populated portion of the Region of NANCY. It included the city of NANCY (U-81), the Regional Capital. However, about one-half of the Region, geographically, was in the Zones of three other military commanders. Nore of the three Departments of the Region, all politically administered from NANCY, lay wholly in the Third Army's Zone.

The Department of the MEUSE was almost evenly divided between the Third Army Zone and the Communications Zone, with a small segment in the north jutting into the First U.S. Army Zone. The Department of MEURTHE-et-MOSELLE, lying chiefly in the Third Army Zone, had its northern extremity in the First U.S. Army Zone and its southern extremity in the Seventh U.S. Army Zone of the Sixth U.S. Army Group. The Department of the VOSGES was wholly in the Seventh U.S. Army Zone, except for a corner embracing the important center of REMIREMONT (2-4975) that was in Third Army territory.

In the administration of NANCY Region, therefore, seven general headquarters had an interest, as follows:

Third U.S. Army
First U.S. Army
Communications Zone
Twelfth U.S. Army Group
Supreme Headquarters
Sixth U.S. Army Group
Seventh U.S. Army

All of these headquarters were concerned in such matters as rail and bus transportation, civilian passes, wire communications, and official courier and postal services, which, to serve the Region, had to cut across all of their boundaries.

An eighth factor became involved when Allied authorities drew yet another boundary, separating the NANCY Region, as a Military Zone, from the nationally administered French Zone of the Interior. Privileges permitted in the interior were denied to Frenchmen just east of this line because of their nearness to the battle front.

At the same time, the Third U.S. Army was undergoing a transition from bivouacs to billets, involving the moving of thousands of officers and men from tents to French-owned buildings. Large quantities of coal and other material had to be requisitioned. The Army was dealing with the civilian population for the first time both intimately and on a huge scale; each was getting acquainted for the first time with the other's methods.

The fact that this transitional period, difficult for both Allies, was passed without a serious incident of disagreement was tribute to the diplomacy and tact of each. AC of S, G-5, reported as follows to the Chief of Staff on 17 October:

> "Two distinguished French educators were appointed to the chief political posts in NANCY. M. PAUL CHAILLEY-BERT, Professor of Medicine at the University of NANCY, is the Regional Commissioner. M. JULES BLACHE, another professor of the same university, a former soldier and hero of VERDUN, is the Prefect. Both speak English. M. BLACHE was an exchange professor at HARVARD in 1935.
>
> "These men are giving all assistance in their power to the American Army. The problems they face are not easy ones. With only the most limited official telephone communications and no postal service, they are forced to rely chiefly on bicycle couriers to carry on the administration of a large district. Restrictions on civilian travel, especially to PARIS and other large centers in the rear, and [illegible] in the lack of communications, make it extremely difficult to restore regional industries and insure the employment of large numbers dependent on them. The authorities are frankly worried about the possible economic consequences of a long stabilization of the front and the continued isolation of the Region for military reasons.
>
> "They expect the food and black market situation to be adjusted rapidly, largely because the American Army is feeding itself, thus freeing great quantities of produce formerly requisitioned by the Germans. Ways of overcoming the transport shortage and of getting in supplies from farms are being worked out, in cooperation with Civil Affairs."

Efforts to relieve the administrative situation without sacrificing military security were continued in numerous conferences between civil officials and officers representing the Commanding General, Provost Marshal, G-2, G-5 and the NANCY Civil Affairs Detachment. The Commanding General interested himself directly in the matter. As a result, freer civil communication for official purposes was gradually established.

The railway liaison passenger service for military officials running from PARIS to BAR-le-DUC (U-1122) was extended to NANCY (U-81), with daily service except Sundays, and use of this service for necessary business of the government was authorized.

Couriers appointed by the Regional Commissioner were given authority to carry official mail in the army Zone. Allocations of gasoline and oil were made for essential civilian services.

Operation of a daily train for supplying NANCY (U-81) with food was begun on 24 October, and means developed whereby farmers could deliver produce into the city.

Meanwhile, the evacuations of refugees from front line areas, and of displaced persons from forward centers to VERDUN (U-26) and thence rearward into the Communications Zone, were carried on for the dual purpose of reducing security hazards and relieving the emergency supply problem in the Army's Zone.

As the month closed, the political situation was stable with no apparent internal or external disturbances. The civil administration was proceeding as smoothly as could be expected under the conditions of a Combat Zone.

SECTION II

PERSONNEL AND ADMINISTRATION

The early part of October was spent in interviewing Military Government Detachment Commanders in order to ascertain availability of personnel and existing shortages.

The return of British officers on duty with Civil Affairs Detachments, to 21 Army Group British, was completed during October.

Nine French Army officers, natives of or otherwise well acquainted with ALSACE-LORRAINE, were attached to this headquarters, replacing an equal number of French liaison officers with Army, Corps and Divisions.

New Tables of Organization were received from higher headquarters for Army, Corps and Division staffs, including authority for promotion of Army, Corps and Division Staff personnel, without requiring submission to higher headquarters for final action. This authority made possible the promotion of several staff officers long deserving of promotion. The new Tables of Organization authorized the following grades:

Officers	Army	Corps	Inf Div	Armd Div
Colonel	2	1	0	0
Lt Colonel	7	1	1	1
Major	10	1	3	2
Captain	5	0	1	1
Warrant Officer	1	0	0	0

Enlisted Men				
Grade 1	3	0	0	0
Grade 2	10	1	1	1
Grade 3	16	1	0	0
Grade 4	11	1	1	1
Grade 5	10	1	3	2
Grade 6	0	0	1	1

SECTION III

INTELLIGENCE

Close observation over civilian sentiment and the political situation in the Zone of the Army was maintained through personal investigations by staff members, daily checks of newspapers, and regular contacts by liaison officers with Detachments and Corps ACs of S, G-5.

Except for the activity of the younger Communist group in recruiting new members and aggressively presenting its case, the public was generally apathetic toward political issues. Formal recognition of the DE GAULLE government by the UNITED STATES was enthusiastically hailed in NANCY (U-81) political quarters as removing the last barrier to full French participation in the war.

An army-wide survey determined in advance that the celebration of All Saints' Day and Day of the Dead on 1 November, while assuming the character of a wartime memorial to fallen French heroes, would have no political significance. A similarly rapid review of plans for meetings and processions on this day, showed that none of these was likely to interfere with military traffic or jeopardize security.

In a series of meetings with G-2 and Counter-Intelligence Corps officers, plans were coordinated for intelligence operations in GERMANY with a view to cementing the closest of relationships between Military Government and Counter-Intelligence Corps. Agreement was reached on common aims.

SECTION IV

PLANS AND OPERATIONS

Early in the month, the G-3 sub-section on accommodations requested G-5 section to assist in obtaining information on the number and types of covered accommodations available for use in towns in the Army Area. Detachments within the area were requested to forward such information to Plans and Operations for routing to G-3. Later, the Branch was made responsible for all billeting problems of G-5 Section.

Upon instructions of Twelfth U.S. Army Group, one "B" and four "D" Detachments, which were only lightly employed at the time, were released for return to European Civil Affairs Division to be reformed and trained for Military Government duties in GERMANY.

Boundary changes were few during the month. The northern boundary changed slightly to the south and the three Detachments supervised by the Army in the Duchy of LUXEMBOURG passed to control of Ninth U.S. Army.

On the movement of the Section to NANCY (U-81), the Military Government Detachments were ordered to move forward also, but it was not until the last of the month that suitable billets could be found for them. A training program was instituted for these Detachments covering subjects of Military Government. The AC of S, G-5, XX Corps, was able to use some of the officers and men on Civil Affairs problems in the Corps Area, but this training was abandoned upon movement of the Detachments to NANCY and because of the desirability of keeping them together for quick deployment in the event of a sudden need.

Based on a study of the projected Zone of the Third U.S. Army in GERMANY, fourteen additional Military Government Detachments were requisitioned, together with proportionate administrative company headquarters.

Digitized by Google

Because of the fewer number of Civil Affairs Detachments now attached to the Army, it became necessary to revise their operations to keep nine available to each Corps. Seven Detachments were retained in the Army Area. Later another [illegible] Detachment was placed on temporary assignment to XX Corps to assist in civilian security controls on that Corps' front.

REFUGEES AND DISPLACED PERSONS

The most significant development during the month in handling refugees and displaced persons was the opening of [illegible] through which displaced persons could be moved from the Army Area into the Communications Zone. During the month 2,155 such persons were moved. This movement was in accord with the objective of preventing any uncontrolled mass movement of displaced persons along military routes. It also had the effect of using the Displaced Persons Centers as Transit Centers and not as Assembly Centers.

The actual number of refugees and displaced persons in the Army Zone was fairly constant from week to week, however, because of accessions. The figures by weeks follow:

	Refugees	Displaced Persons
2 October	7,178	7,105
9 October	7,501	9,351
16 October	13,998	10,601
23 October	13,429	10,351
30 October	13,733	9,964

The BRIEY Displaced Persons Transit Center was vacated late in the month to provide quarters for the Rear Echelon, XX Corps. A skeleton force of displaced persons was left in the camp. The understanding with the Corps was that this Center would revert to use as a Transit Point when and as the Corps Headquarters troops moved out.

Two plans were drafted looking toward operations in GERMANY. One concerned the handling of a possible influx of 50,000 displaced persons into FRANCE, the other the care and control of refugees and displaced persons along the Franco-German border and in GERMANY.

Three additional teams of the Mission Militaire Liaison Administrative, each composed of five French women specially trained in refugees and displaced persons work, were attached to the Army in October making a total of eleven such teams assisting in displaced persons work in the Army Zone. In addition, fifteen American Red Cross representatives were similarly engaged.

A meeting was held of representatives from each of the four Detachments earmarked for displaced persons work in GERMANY and of six officers from the Military Government Detachments. Problems arising in camp administration were discussed and the most effective methods of solving them were outlined.

SECTION V

RELIEF AND SUPPLY

Demands for supplies in mounting quantities for refugees and displaced persons made it necessary to increase the stock levels maintained at the Civil Affairs Supply Depot at VERDUN (U-26). On 2 October requisitions were made on the Communications Zone for 150 tons of essential foodstuffs, twenty-five tons of winter clothing and blankets, and twenty-five tons of sanitary supplies. Although these relief supplies were to be furnished from Civil Affairs stocks in Communications Zone depots, Army G-4 approval was necessary as the tonnage lift would have to come from total allocations made to the Army. On 6 October the supplies were called forward on the Quartermaster daily telegram, thus constituting the first movement of Civil Affairs relief supplies via the Army services from the Communications Zone to the Army's Civil Affairs Depot.

As imported relief supplies are intended to supplement local resources and to make up deficiencies in essential foodstuffs, Civil Affairs Detachments were urged to search the countryside and utilize local resources to the utmost. Large quantities of fresh vegetables, potatoes and other items were made available through this source.

In addition to normal relief supply functions an issue of 1,500 pairs of shoes was made from Civil Affairs supplies to the Secours National for emergency use in the Region of METZ. Also at the request of French military authorities, 13,700 pounds of foodstuffs were furnished the French Gendarmerie as an emergency supplement to their ration requirements.

Upon the request of Civil Affairs, a daily issue of 1,400 gallons of gasoline was initiated by G-4 on 17 October to take care of essential civilian needs for the NANCY Region, principally for moving foodstuffs and for harvesting. Approximately 9,000 gallons of captured enemy diesel oils and kerosene were also turned over to the Region, together with 2,000 gallons of oil from Civil Affairs stocks.

The Civil Affairs Supply Depot was moved from VERDUN (U-26) to a more convenient location at ST. NICOLAS (U-9504), and Detachment B212, operating in this town, was placed in charge. The Army Quartermaster furnished warehousemen and labor gangs to inventory and store the supplies, totalling 125 tons. Another 150 tons of Civil Affairs foodstuffs shipped by the Communications Zone to TOUL (U-6410) were also moved to the new depot and stored. Eight tons of clothing, blankets and sanitary supplies were received 31 October.

It was arranged to have future shipments of supplies coming via railroad from the Communications Zone forwarded direct to freight yards at VARANGEVILLE (U-9708), one kilometer from ST NICOLAS (U-9504). Trucks arriving at the Quartermaster depots at TOUL (U-6410) with Civil Affairs supplies were to be dispatched direct to the ST. NICOLAS depot.

Conferences were held with the Regional Food Director and the Supply Officer of Detachment A1D2 at NANCY (U-81) to determine the city's unfilled food requirements. As a result, the Transportation officer of this branch arranged with G-4 to start daily food trains into the city carrying supplies from the surrounding countryside. Other essential food stocks, not available locally, were brought in by Civil Affairs trucks. For example, an issue of evaporated milk was made and plans were consummated to supply food, milk and soap from Civil Affairs stocks upon receipt of requisitions from the Regional Food Director the first week in November. Assistance was given city authorities in working out additional milk routes through the Army area to meet minimum requirements for the sick, infants, pregnant mothers and the aged; gasoline for milk delivery vehicles was made available from supplies of POL set aside for such purposes.

Sale to French authorities of captured enemy materials was curtailed by Army Administrative Order Number 62, directing that all captured supplies be turned over to the Communications Zone before being released to Civil Affairs for sale. Prior to receipt of this order the following releases were received and turned over to French authorities against quantitative receipt:

Frozen beef	26 long tons
Barley	60 long tons
Hay	45 long tons
Straw	60 long tons
Oats	525 long tons
Blankets (Displaced Persons Centers)	300 each
Mattress Covers	1400 each
Clothing (Undergarments)	8325 each
Refrigerators	12 each
Wrecked or Old Motor Vehicles	130 each
Flour	25 tons
Medical Supplies	3 tons
Building Material	300 tons

Anticipating a gradual influx of 50,000 to 100,000 displaced persons in the Army Zone, plans were made for a stock of 500 tons of relief supplies in the Civil affairs Depot, made up of 350 tons of foodstuffs, fifty tons of sanitary supplies, including soap, and 100 tons of clothing, blankets and emergency feeding units. It was estimated this stock would care for 20,000 persons for thirty days.

To maintain a stock level of 500 tons, request was made to G-4 for a daily tonnage allocation of twenty-five tons.

Relief supplies on hand in the Civil affairs Depot, as of 31 October were as follows:

Food	173.5 tons
Clothing	3.2 tons
Blankets	2.1 tons
Sanitary Supplies	9.2 tons

The following items were due from Communications Zone on requisitions forwarded 6 October:

Sanitary Supplies	24 tons
Clothing and Blankets	23 tons

Another requisition upon Communications Zone 27 October included the following items:

Food	220 tons
Clothing and Blankets	65 tons
Sanitary Supplies	20 tons
Emergency Feeding Units and tentage	36 tons

Relief supplies issued to French authorities in October for emergency needs, refugees and displaced persons were as follows:

Food	129,680 pounds
Soap	10,080 pounds
Shoes	3,850 pairs
Gas, Oil, etc.	33,000 gallons
Clothing (undergarments)	2,546 each

TRANSPORTATION

Trucks of the Civil Affairs Pool travelled a total of 108,800 kilometers, and hauled over 6,500 displaced persons and more than 5,634,000 pounds of food, clothing, medical supplies, fuel, beds and other essentials in October.

Noteworthy activities included: Fifty trucks and trailers assisted the Army Quartermaster in moving Class II and IV Depot from VERDUN (U-26) to TOUL (U-6410); 370 tons of flour were moved from VERDUN to the city of NANCY (U-81); 350 steres of wood were brought into the city of VERDUN to avert a fuel crisis; assistance was given to a number of communities in transporting the year's harvest, especially potatoes, from field to storage. Trucks were loaned to Displaced Persons Centers for periods of two to five days to bring in food, fuel and other essentials from the surrounding areas.

Salvage of enemy vehicles was practically abandoned during the month due to lack of material to work on. Three enemy ambulances were recovered, reconditioned by mechanics of the G-5 motor pool, and presented to the Army Medical Corps. The five enemy trucks that had been reconditioned earlier were employed continuously in moving refugees and displaced persons, hauling crops, field workers, supplies and refuse.

The 2d Platoon, Service Company gave repair service to forty-seven Civil affairs vehicles. The work included second, third and fourth echelon maintenance and ranged from 6000-mile checks to complete rebuilding of one truck, several frame straightening operations and one motor exchange job. The paint shop of the Platoon turned out 524 signs for Civil Affairs use and repainted eleven vehicles. Eight vehicles and drivers were loaned to Detachments for periods of from one week to one month. A Maintenance Patrol was established to inspect and service the organic vehicles of all staffs and Detachments in the Army Zone.

In railroad transportation, major attention was centered on the needs of NANCY (U-81). Permission was obtained to run two food trains per week into the city. Permission also was secured for civilian officials, making official trips, to ride trains between PARIS and NANCY.

A total of 475 freight cars and eleven locomotives were reported as available to Military Railway Service. Through civilian agencies essential rail traffic for the supply of LUXEMBOURG was started and the whole rail system put into order. Trolley service, operating on a fifteen minute schedule during daylight hours, was begun between the three adjoining towns of KNUTANGE (U-8586), HAYANGE (U-7783) and FLORANGE (U-8582). Railroad facilities between BAR-le-DUC (U-1122) and LIGNEY (U-2814) were rehabilitated and permission sought to operate local trains.

Digitized by Google

Largely due to civilian efforts prompted by Civil Affairs a railroad line was opened between KRUFMATEAU (Z-8477) and PITTEL (Z-6757) via the junction north of MERMAT (Z-4132). Other lines in the vicinity were inspected and reported to be in good condition.

A survey of all civilian transportation facilities including motors, in Third U.S. Army Zone, was initiated to gain a complete picture of the French transportation situation.

LABOR

In labor, major emphasis was placed on supplying needed workers for Army projects and maintaining sufficient local farm labor in rural areas to take care of harvests.

In NANCY (U-81) and SORCY (V-7525), the 150th Ordnance Battalion requested more than 200 laborers to unload trains. These were supplied through Civil affairs Detachments. In a similar manner thirty men needed in the 93d Medical Depot, were found and put to work at TOUL (U-6410) and ninety civilian laborers were obtained for the 2&9th Engineers for the construction of a bridge near POMEY (U-8020).

Largely through Civil Affairs efforts, civilian laborers from the highway department of MEURTHE-et-MOSELLE were put to work cleaning up dangerous mud conditions on roads in the vicinity of NANCY (U-81).

At BRIEY (U-6873) a question of jurisdiction arose in which civilian laborers were being hired without the knowledge of the French Labor Exchange. Civil Affairs assisted in settling the matter to general satisfaction.

During the early days of the month some trouble was experienced in the BRIEY (U-6873) region because of rumors of high wages being paid at CHERBOURG (O-11) and BRITTANY ports by the Allies. Many workers wanted to quit and go to these regions. The rumor was thought to be enemy inspired, and was quieted largely through Civil Affairs efforts.

AGRICULTURE

October was harvest month. Normal crops were satisfactory. Lack of transportation and labor shortages in some localities were the major problems.

Near PIENNES (U-5983), BRIEY (U-6873), ERROUVILLE (U-6782) and LUDELANGE (U-7391), Russian and Polish Displaced Persons were employed to dig and transport potatoes from German planted fields. Much transportation was supplied to local communities by the Civil Affairs Transport Pool.

During the month it developed that, due to military travel restrictions, farmers were unable to bring their produce into NANCY (U-81) and other towns but were being turned back at restraint lines. A special plan was worked out at NANCY, to meet the situation whereby farmers brought produce to a designated spot in the outskirts where they could contact produce buyers from the city.

Several agricultural specialists from Detachments destined for GERMANY visited the section for briefing on problems to be encountered.

At BAR-le-DUC (U-1122), a threatening shortage developed from competitive Army bids for both skilled and unskilled labor. By way of an attempted solution Civil Affairs arranged for local authorities to prepare a wage scale for use by Army units in the area.

COMMUNICATIONS

The following telephone circuits were repaired by French "PTT" workmen for military use:

Circuits	Cities
6	ARNAVILLE (T-7647) - NANCY (U-8512)
6	NANCY (U-8512) - TOUL (U-6410)
6	TOUL (U-6410) - FOUG (U-5911)

Courier service and telephone service for essential civilian activities were authorized in LUXEMBOURG.

Telephone [illegible] the army net were installed for Detachments G5C2 and A1D2. A special installation from NANCY (U-81) to ST. NICOLAS (U-9504) was made for the Civil Affairs Warehouse and Transport Pool at the latter location. A private telephone line from NANCY to PONT ST VINCENT (V-7903), used to coordinate the electric power supply for the city of NANCY, was repaired. Technical telephone circuits from the "PTT" Regional Chief Engineer, NANCY, to specified "PTT" officials throughout the Region in the Army Zone were authorized to facilitate the repair and maintenance of civilian circuits used by the Army.

Arrangements were completed for work on power transmission lines from BUISSONCOURT (U-9709) to SAULXURES (U-9001), and for a branch line to ZARBEUIL (U-9411).

Through cooperation with the Army Transportation Corps arrangements were made to ship a sixty ton stator from a turbogenerator unit in VINCEY (Z-9673) to PARIS for repairs making it possible later to generate an additional 25,000 kilowatts for use in the NANCY Region.

The rehabilitation of the coal mining industry in FRANCE was expedited by enabling companies to obtain equipment from the Communications Zone.

A factory which manufactures shoe nails was assisted to resume operations, thus ensuring the shoe industry in MEURTHE-et-MOSELLE to start production again after near prostration.

Reports on the industrial potential of the NANCY Region were forwarded to the General Purchasing Agent, Twelfth U.S. Army Group.

PUBLIC WORKS AND UTILITIES

In ETAIN (U-4770) a survey of the water system was made and the city was assisted in making repairs to insure an adequate water supply and prevent pollution.

SECTION VI

GOVERNMENTAL AFFAIRS

The area over which the Army exercised Civil Affairs responsibility during October was essentially industrial. The disruption of industry and transportation facilities had been accompanied by shortages of food, fuel, and basic supplies. Resources were further taxed by Army needs. The impact of these factors upon an industrial society, geographically adjacent to GERMANY, provided a new test for gauging the capabilities of French Civil administration. However, in the Region of NANCY it demonstrated the same stability, resourcefulness and capacity for cooperation observed in other areas traversed by the Army.

Recognition of the French Provisional Government by the UNITED STATES and GREAT BRITAIN undoubtedly increased the desire of the French authorities for further participation and cooperation in the war effort. The agreements concluded between the French Provisional Government and the Allies with respect to zones of authority, supplies, enemy property and related subjects removed points of local conflict and established a basis for mutual aid and effort.

The action of Colonel GRANDVAL, Chief of the French Army for the district, making it unlawful for anyone except members of the French Army to wear French uniforms, and the discarding of Les Forces Francaises Interieures (FFI), prompted order by settling the question of constituted and legal French police authority.

At local levels, several meetings were held with French officials, including the Regional Commissioner, the Prefet of the Department MEURTHE-et-MOSELLE, Sous-Prefets, and police officials, at which military and Civil Affairs objectives were emphasized and French problems considered. At these conferences it was firmly established that all liaison between French officials and the army would be effected through Civil Affairs. Largely as a result of these meetings, French authorities throughout the Region took effective steps toward assisting military operations, by the establishment of security patrols, enforcement of curfew, blackout, traffic and circulation restrictions and by the organization of their own resources.

The NANCY Region presented new and complex problems but they were met by close liaison between French Civil Administration and Civil Affairs and by the experience gained in prior operations. French authorities gave active assistance in the apprehension of civilians charged with the commission of offenses against the Army. French Courts, after being notified of their position under French-American agreements, assumed proper jurisdiction over displaced persons charged with the commission of offenses against French civilians.

Questions with respect to the ownership and disposition of captured enemy property were satisfactorily settled upon the basis of agreements concluded between the French Provisional Government and the Allies.

FINANCIAL

The financial situation changed little in October. Little new territory was uncovered and financial problems were further minimized when the Duchy of LUXEMBOURG passed out of Third U.S. Army control.

The Financial sub-section continued its preparations for military Government in GERMANY by holding a number of conferences with Finance and Property Control officers of detachment B1A2, 2d European Civil affairs Regiment. Instructional guides were prepared based on directives from higher authority, but modified to meet the conditions to be expected in a combat area prior to GERMANY'S complete collapse.

As a result of appeals from Detachments a letter was sent to Twelfth U.S. Army Group requesting authority to expend Civil Affairs funds for the preparation of food for enlisted personnel of Detachments.

On 9 October a meeting was arranged between Army finance officers and the officials of the Banque de France, NANCY (U-81). The Banque agreed to accept mutilated currency for exchange at par provided that sixty percent of each note was intact. It reserved for future decision the question of accepting deposits on transfers from Civil Affairs sub-accountants of supplementary francs, based on its own interpretation that such francs might not have been "in circulation" under terms of the latest monetary agreement between the UNITED STATES and GREAT BRITIAN and the French Committee of National Liberation.

During October, surplus funds of Detachments of approximately 375,000 francs were transferred to the sub-accountant of this G-5 Section who had on hand at the end of the month 1,706,430.60 French francs and 200,000 German marks.

PUBLIC SAFETY

The temporary stabilization of the Army in a region adjacent to GERMANY made it imperative to secure the full and effective cooperation of the French police in the enforcement of all security measures. Meetings were held of French officials, Military Police, Counter-Intelligence Corps and Civil Affairs Public Safety officers. As one important result of these conferences, the Prefet of the Department MEURTHE-et-MOSELLE issued a decree requiring civil police to arrest all unidentified or suspicious civilians in the forward area of the XII Corps. Strict enforcement of restrictions against civilian traffic upon military routes was aided by the use of the Gendarmerie.

No fires affecting military operations or military personnel occurred in the Army Zone.

A meeting was held in the office of the Civil Affairs Detachment A1D2 at NANCY (U-81) on 30 October attended by Passive Air Defense officers of Supreme Headquarters, Twelfth U.S. Army Group, Third U.S. Army, Public Safety officers of G-5 Section Third U.S. Army and of Civil Affairs detachment A1D2 and civil defense and fire officials of NANCY, for the purpose of discussing immediate passive air defense requirements. Enforcement measures were explained and procedures adopted for the protection of military operations and civilians.

PUBLIC HEALTH

Public Health problems of the month were emphasized by the appearance of a suspected case of typhus fever in a Displaced Persons Assembly Center, a continued endemic incidence of enteric diseases, such as typhoid fever and diphtheria, and provision for medical and sanitary supplies of displaced persons.

Digitized by Google

DECLASSIFIED

Communicable [illegible] a flare-up of dis[illegible] gation into a few sporadic [illegible] limited to three cases.

A suspected case of typhus fever was reported at the Displaced Persons Center in VERDUN (U-36). It occurred in a young Russian woman, who was immediately isolated until further examination. Clinical and serological examination later proved that it was not typhus fever. In the meantime, however, insecticide powder of French origin was flown in from PARIS and about 2,000 persons were deloused.

Local health facilities were adequate. A survey revealed that civilian medical agencies were anticipating shortages of the following items: vaseline, liquid petroleum, glycerine, lanoline, iodine, alcohol, ether, opium, codeine, morphine, heroin, strychnine, santonin, ammonium citrate, chloral, sodium perborate, bismuth, subnitrate, quinine and atropine.

Medical supplies on hand at the Civil Affairs Supply Depot were of two categories. Displaced Persons Centers could requisition initial emergency supplies from the depot in the form of dressing, drug, and instrument kits which were made up from captured enemy stocks, while for the civil population Allied Relief Board Units were available for use in large areas. Small amounts of medical supplies for civilian medical institutions were also sent by requisition to the depot, and were filled from items included in Allied Relief Board Unit of drugs and dressings.

A nutritional survey revealed a gradual improvement in the food supply. However, children especially were found to be suffering from a state of poor nutrition. This was probably due to an excess of carbohydrates, lack of milk, fats and meat in their diet. Food rations were most adequate to cover needs of children up to six years of age. The growing children and adolescents felt the restrictions most. There was everywhere a latent vitamin deficiency among children but no real avitaminosis.

Public Health officers assigned to the 2d Medical Detachment, 2d European Civil Affairs Regiment were available to the Public Health Section for duty on special problems. This pool of officers and a Red Cross Public Health nurse proved of value in making special surveys.

CHAPTER 6
NOVEMBER OPERATIONS

SECTION I

GENERAL

Three widely different types of G-5 operations developed as a result of the Army's resumption of its advance.

First, in the Army Area and especially in the communities along the Rear Boundary that were farthest from the front, more and more problems arose having to do with the restoration of normal life. Here, combat had passed on. Not even the sound of guns could be heard. Tradesmen, producers and local officials found it difficult to understand why Combat Zone restrictions should be continued that far in the rear. Civil Affairs became essentially an interpreting and adjusting agency between civilian and military needs to the end that the vital requirements of both could be satisfied. It succeeded well enough in this role that no differences arose that were not speedily reconciled, and that French cooperation in enforcing necessary restrictions continued unbrokenly.

Second, in the forward areas of the Army's Zone a totally different situation existed. The closeness of combat was all too evident here. Towns and villages were badly damaged. The bare necessities of civilian life dominated all demands. At the same time, the preservation of military security was acutely a problem. Most [illegible]

of LORRAINE had been incorporated in the REICH, provided with a thoroughly German officialdom and a vigorous effort had been made to Germanize it. Both French and German were spoken. German nationals were actually present, though territorially the country was still a part of FRANCE and was to be so treated administratively. Thousands of refugees and displaced persons, the latter mostly Russians and Poles, added complications to problems that shortly were absorbing all the personnel that G-5 could muster for the task. These included workers of the Secours National, of the French and American Red Cross, relief teams of the Mission Militaire de Liaison Administrative, French medical workers, and Military Government Detachments awaiting assignment to GERMANY. In this newly liberated area that had been fought over for centuries, whose people were tired of war, Civil Affairs set up new local governments to replace those that had fled with the enemy, it helped bury the dead and clear the rubble from the streets, it assisted in weeding the disloyal from the loyal, and handled many thousands in the inevitable movements of people that always take place during combat.

The third type of operation involved the establishing of Military Government in GERMANY itself. This occurred when Military Government Detachment I5G2 (I5, Company G, 2d Civil Affairs Regiment) made up of three officers and eight enlisted men, crossed the French-German border with the 10th Armored Division of the XX Corps and took over the administration of the villages of PERL (Q-0298), WOCHERN (L-0202), BORG (L-0601), EFT (Q-0698), BUESCHDORF (Q-0797) and TUENSDORF (Q-1108) just south of the LUXEMBOURG border. The first proclamations of Military Government in the Zone of the Third U.S. Army were posted in the German villages on 24 November. The Detachment, however, temporarily maintained its own headquarters at SIERCK-les-BAINS (U-9994), FRANCE, moving to BORG on 29 November.

At the end of his first week of Military Government, the Commanding Officer of I5G2 reported to Army AC of S, G-5, that the German villagers had begun to show an "attitude of friendliness and cooperation" to American troops. He added: "Some of the inhabitants have openly expressed their anti-Nazi feelings. Consensus of opinion is that GERMANY is doomed and that the quicker the Allies overthrow the NAZIS the quicker GERMANY will be able to begin reconstruction."

SECTION II

PERSONNEL AND ADMINISTRATION

Four additional French liaison officers were attached to the Army Civil Affairs Staff late in the month, making possible the further attachment of one French liaison officer to each Corps and Division of the Army.

Several changes were made in assignments to Division Staffs, one because of casualty, others because of activations. Staffs were formed for the 10th Armored Division and the 26th and 95th Infantry Divisions.

A Polish liaison officer was attached to this Section, by higher headquarters, for duty in connection with displaced persons and refugees. Additional Polish personnel was requisitioned.

SECTION III

INTELLIGENCE

Courier-liaison officers of the Intelligence branch, operating on daily schedules between Army and Corps headquarters and between Army G-5 and Detachments in the Army Area, were employed increasingly for intelligence purposes and the rapid procurement and dissemination of information by informal message and word-of-mouth.

By directed inquiries made through these four officers, it was possible to obtain facts from any part of the Army Zone within twenty-four hours, where use of the telephone might have jeopardised security or where reliance upon formal reports might have meant a delay of several days. By the same officer, urgent information was sent to Corps Staffs and to Detachments.

The liaison service was used most successfully in getting out word that no parades and outdoor assemblies would be permitted on Armistice Day, and in quickly checking some plans for those that were already underway. Again, upon the reopening of the Army's offensive on 8 December, and the complete prohibition of civilian travel on highways during the first forty-eight hours, the courier-liaison officers carried prompt instructions to Detachments to enlist local police in assisting to enforce the order.

Later, upon receipt of information that large coal mines in the Army's front might be highly dangerous because of the presence in the shafts of methane gas that a lighted match or cigarette could ignite, the courier-liaison officers took forward the warning to Corps G-5s.

Serving also as couriers, they expedited the delivery of all written reports, carried special material forward to Corps, and brought back captured enemy documents, tent books and trade forms requested by higher headquarters. A total of 24,000 miles was travelled by the courier-liaison service during the month.

A security threat arose in the FENTSCH River Valley near HAYANGE (U-7783) where the population was largely German nationals. Information was reaching the enemy from suspected civilian sources there. The branch acted as the coordinator between G-2 and G-5 in arrangements that resulted, on 10 November, in the sudden arrest and internment by French authorities of 444 of the enemy nationals in a single action wherein the French, Counter-Intelligence Corps and Civil Affairs cooperated.

The possibility of the enemy using the advertising columns of newspapers to transmit messages was brought to the attention of local publishers through Allied Press Censorship officers. The publishers agreed to limit their advertising columns thereafter to recognised commercial organisations and to others who had been cleared by the French Bureau of Military Security.

Using enlisted personnel, investigations into French attitudes and opinions were continued among working people and small shopkeepers. They produced no evidence of resentment because of the restrictions imposed upon civilians in the Army Zone but on the contrary indicated a feeling that existing restrictions should be more strictly enforced.

Preparatory to operations in GERMANY, a three months' supply of maps covering the territory of interest to the Army was procured.

The ever growing numbers of refugees and displaced persons in forward areas added to the problem of maintaining security checks. Temporary assistance in screening and controlling these thousands was given the Counter-Intelligence Corps at the request of AC of S, G-2. For this work, seven teams of one officer and three enlisted men each were organised from the personnel of Military Government Detachments awaiting assignment to duty. As far as possible, team members were selected for ability in speaking the Russian, Polish and German languages. Each team was made completely mobile with one one-quarter-ton truck and trailer.

Three of the special teams spent eight days assisting Counter-Intelligence units of the 5th, 90th and 95th Infantry Divisions in the vicinity of METZ (U-85), a fourth team was employed by the XX Corps in the Corps Area, and the other three teams were used to augment Counter-Intelligence units in the Army Area.

By executive order on 15 November, supervision of civilian communication matters was made the responsibility of the Intelligence branch, because of the increasing importance of maintaining security in this field and the constant coordination necessary with AC of S, G-2. Accordingly the Communications sub-section, formerly operating under the Relief and Supply branch, was transferred to Intelligence branch. In addition to posts, telephone and telegraph, the sub-section continued its supervision of industrial matters and of public works and utilities.

COMMUNICATIONS

Constant liaison between military and civil authorities continued successfully the policy of enlisting French technical knowledge, personnel and facilities in the Army's service at a saving of military assistance in extending essential communications to expedite the civil administration of the Region.

Utilising French technicians and labor, eight additional civil telephone circuits were restored between NANCY (U-61) and TOUL (U-61) for Army use. Immediately after the capture of METZ (U-85), former telephone installers there were recruited, cleared through Counter-Intelligence Corps, and put to work repairing circuits in that area. Arrangements were made to restore the dial PBX system for necessary Governmental purposes.

Through the Army Provost Marshal, a labor crew of forty German Prisoners of War was obtained to dig up buried telephone cable, enabling the Signal Corps to locate and repair sabotage damage done to telephone lines [illegible]

DECLASSIFIED

Digitized by Google

A German radio transmitter and receiver were found in METZ and turned over to the Enemy Equipment Identification Service. German maps showing intercity telephone cable facilities in ALSACE were discovered for the Army Signal officer.

On behalf of the French, authorization was obtained for resuming official telephone service between NANCY and BAR-le-DUC (U-1122) and principal points in the Army Zone. Intercity postal service limited to non-illustrated postcards and open letters not exceeding twenty grammes was permitted. A plan was worked out that enabled the Regional Commissioner to telephone daily to Departmental Prefects over military lines. Telephone service for a French meteorological station at REMILLY (U-9215) was authorized.

To help implement the expansion of these civilian services, censorship stations were established by Allied Censorship officers and the Service des Controles Technique, closely in cooperation with Army G-5 and G-2. Large quantities of civilian mail that had been impounded since 15 September were censored and released.

PUBLIC WORKS

Assistance was given the Army Engineer in obtaining from French officials of the Region information concerning dangers to bridges and highways from flood waters and winter weather. Preliminary conferences were held on snow removal and the sanding of icy roadways. The Regional Bureau of Bridges and Highways was given permission to make repairs on certain bridges where the interruption of military traffic would not prove serious.

Engineer Mine Detectors were procured for checking the NANCY water supply system for enemy mines. The water system at REMILLY (U-9215) was examined and repairs got underway to restore normal operation. Sealed telephone service was authorized to permit NANCY to effect necessary control of the city's water sources.

SECTION IV

PLANS AND OPERATIONS

Renewal of the offensive placed heavy demands upon all Civil Affairs and made necessary the emergency employment of a large number of the officers and men of Military Government Detachments with the Army.

Upon request, the Twelfth U.S. Army Group suspended an order requiring the return to European Civil Affairs Division of those Detachments not regularly assigned to towns in FRANCE, and all twenty-five Civil Affairs Detachments attached to the Army were permitted to continue under its control during the advance to the German Border. Use of these Detachments was determined as follows:

1. Nine were to be left in as many key French cities and pass to the control of the Communications Zone when the Army's Rear Boundary moved forward. The nine cities were:

VERDUN (U-2865)	THIONVILLE (U-4667)
BAR-le-DUC (U-1122)	BOULAY (U-4565)
TOUL (U-4210)	FORBACH (U-3966)
NANCY (U-8612)	SARREGUEMINES (U-4155)
METZ (U-6757)	

2. Five Detachments were to establish and operate Transit Points for the control of refugees and displaced persons at five designated points during the Army's advance to the German Border, but once the border was passed, they were to proceed with the Army into GERMANY for similar work there, while another set of five Detachments took over the Transit Points that had been established. The designated Transit Points were:

THIONVILLE (U-4667)	BOULAY (U-4565)
METZ (U-6757)	FORBACH (U-3966)
SARREGUEMINES (U-4155)	

3. Military Government Detachments were to be brought up to their authorized strengths, if necessary, by transfers of best qualified officers and men from the Civil Affairs Detachments scheduled for eventual return to European Civil Affairs Division.

The month opened with the entire group of Military Government Detachments assembled for training in a single location at MAXEVILLE (U-9213), a suburb of NANCY (U-8612). However, as the Army's advance uncovered fought-over areas in urgent need of assistance, twelve of the Detachments were dispatched to the most badly damaged villages to direct the efforts of hard pressed local committees. They assisted in clearing streets of debris, restoring essential services, and in transporting refugees back to their homes, where they ceased to be a military problem. A total of fifty-seven small communities were thus aided.

Other Military Government Detachments were used to supplement Civil Affairs personnel at Displaced Persons Centers, thus gaining valuable experience in this work. Eight Detachments were sent forward to Corps preparatory for assignment to localities in GERMANY.

Staff officers of Army G-5 were briefed daily in the tactical situation. A week's course of instruction in Military Government staff problems was conducted, at which chiefs of G-5 branches and sub-sections gave twelve half-hour talks on their plans and objectives for GERMANY.

On 30 November, twenty-nine Detachments were operating in the following towns:

VERDUN (U-2865)	DOMBASLE (U-9804)
BAR-le-DUC (U-1122)	ST MIHIEL (U-2456)
NANCY (U-8512)	JEAN MOUPET (U-9804)
TOUL (U-4210)	CHATEAU SALINS (U-1025)
METZ (U-6757)	MARSILLY (U-6991)
LUNEVILLE (U-1936)	HAYANGE (U-7783)
DIEUZE (U-252.)	90th Div Area (U-7577)
REMILLY (U-0116)	5th Div Area (U-4442)
ST JEAN KOURTZERODE (U-3526)	BOULAY (U-4565)
PONT-a-MOUSSON (U-7635)	LES ETANGS (U-0161)
THIONVILLE (U-8687)	BOLEY (U-4473)
FORBACH (P-7901)	METZ (U-6961)
CITRY-des-CHAMBOURCIS (U-1552)	

Military Government Detachments were engaged in emergency refugee work under Army control in the following communities:

ATTILONCOURT (U-0622)	AUBOUE (U-9418)
BLENOD (U-9922)	FLEURY en CHARIOTS (U-0527)
ST NICOLAS (U-9404)	CHATEAU SALINS (U-1025)
MOMERY (U-8933)	AUTREVILLE (U-9731)
MARVILLE (U-9926)	

Three Detachments were en route, three awaiting assignment in forward areas, and seven were under training.

REFUGEES AND DISPLACED PERSONS

Evacuation of 10,984 displaced persons from the Army Zone into Communications Zone was effected in November under G-5 direction. Assembly Centers in the Communications Zone were established under the administration of French authorities and made possible the rapid reception and rearward movement of displaced persons uncovered in new territory liberated by the Army.

The numbers of displaced persons in Transit Centers, the total numbers in Army Zone, and the numbers evacuated by train and G-5 truck transport are shown below:

DATE	DPs IN THIRD ARMY ZONE	DPs IN TRANSIT CENTERS	NUMBERS OF DPs EVACUATED WEEKLY
6 Nov.	7,391	4,304	2,620
13 Nov.	5,850	4,347	301
20 Nov.	8,680	5,359	1,699
27 Nov.	10,117	4,[illegible]4	4,035
30 Nov.		1,897	[illegible]
		TOTAL	10,984

The following Transit Centers were in operation or available for use during the month of November:

	CAPACITY
VERDUN (U-2865)	1,500
PIENNES (U-4983) Headquarters	
PIENNES No. 1	250
PIENNES No. 2	350
ERROUVILLE	2,000
LUDELANGE	800
HAYANGE (U-7783) Headquarters	
ST JACQUES	600
MARSPICH	400
SUCKAYE	400
FLORANGE	400
TENCTILLE	2,000
DOMBASLE (U-9804) Headquarters	
LEMONCOURT	300
ECROLVES	450
PONT-a-MOUSSON	500
CHATEAU SALINS	500
MAIZE	450
MORHANGE	1,000

Plans were completed to divide the Army Zone into Northern and Southern zones of operation for the control of displaced persons and refugees. The plan placed Detachment C2C2 in charge of the Northern Zone and Detachment C112 in charge of the Southern Zone. Each team was given overall responsibility for problems in its zone. However, regular Detachments continued their responsibility and obligations toward displaced persons and refugees. Only when the problem of displaced persons and refugees exceeded the ability of the local Detachment to cope with it, or in the overall administration of large centers, were the specialized displaced persons Detachments to assume control.

The eleven teams of the Mission Militaire de Liaison Administrative, composed of French women, were shifted during the month to displaced persons centers where they were most needed. Ten American Red Cross representatives were similarly employed. One male Polish liaison officer was accredited to Army and was attached to Detachment C112 in the Southern Zone. The sub-section staff was also implemented in its work by the full use of four displaced persons officers on temporary loan from Detachment E1A2, the regional Military Government team earmarked for WESTMARK and LOWER HESSE, GERMANY.

Three special displaced persons Detachments with attached American Red Cross personnel and allied liaison personnel were now operating in METZ (U-05), THIONVILLE (U-68) and BOULAY (U-0965), three of the five cities originally selected as Border Control Stations.

The problem of refugees increased materially the past month. The advance of the Army and the establishment of the "no passage" line at the MOSELLE River, creating a huge "no man's land" between the MOSELLE and SEILLE Rivers, resulted in a congestion of refugees, many of whom had been recently evacuated, anxious to return to their homes west of the MOSELLE.

The total refugees in the Army Zone was as follows:

DATE	NUMBER OF REFUGEES
6 Nov.	15,580
13 Nov.	14,232
20 Nov.	23,885
27 Nov.	32,735

To cope with the urgent refugee problem, approximately 575 French mayors and auxiliary police were returned to their towns through the use of G-5, Quartermaster, and Military Government Detachment Transportation. The general plan of the mayors was to make possible the return of the town populations by reviving local government administration, gathering livestock and food, and repairing and securing homes, a work in which Military Government Detachments gave assistance.

DECLASSIFIED

SECTION V

SUPPLY

Increasing demands for [illegible] stocks available for issue [illegible] resulted largely from the [illegible] thousands of refugees and displaced persons into the [illegible]. The fall of METZ (U-85) created a substantial civilian supply problem, as the city had undergone a considerable period of siege.

A total of 2830 tons of Civil Affairs supplies (1876 tons Class I and 954 tons Class II and IV) was requisitioned and placed on Quartermaster daily telegram. The only incoming stock, however, consisted of thirty-six tons of foodstuffs received from the Quartermaster Class I dump at TOUL (U-61), the balance due on a requisition of 2 October. At the end of November only forty-six tons of stock were on hand as compared to 195 tons at the beginning of the month. Issues thus totalled 185 tons (168 tons Class I and 17 tons Class II and IV).

Continued efforts to have those supplies on requisition brought forward resulted in assurances that items in critical need were being sent at once by rail, identified as Civil Affairs supplies and shipped directly to Civil Affairs Depot, ST NICOLAS (U-9504).

The urgency of the civilian supply problem at METZ was relieved by the capture of large enemy stocks of food, including: 150 tons frozen beef, twenty tons frozen pork, and 650 tons flour, as well as a large quantity of canned foods.

Within several hours release of these foodstuffs was effected through Army and Advance Section Communications Zone so that they were made immediately available for civilian use. Toward the month's end the Detachment at METZ reported that the city had sufficient food supplies for a fourteen to twenty-one-day period and that the emergency was sufficiently in hand to "give the French authorities time to organize an adequate system of civil food supply."

Plans were laid, with the assistance of AC of S, G-5, XX Corps, for the establishment of another Civil Affairs Supply Depot in XX Corps Area. This action was decided upon because the area was largely industrial and expected to be in serious need of relief supplies. A desirable depot site at HAYANGE (U-7783) was submitted for G-3 approval.

At ST NICOLAS (U-9504) Detachment B2I2 was relieved and moved to METZ. However, the Detachment officer in charge of the Civil Affairs Depot remained at the Depot with three enlisted men to continue to administer its operations.

A modification of supply accounting procedure became effective in November. The French government designated the Service des Importations et Exportations as its agency for dealing with imported relief supplies. This agency introduced the République Française receipt form to be used for supplies turned over by the United States Army to French authorities.

POL distribution for civilian use continued satisfactorily, the authorities at NANCY (U-81) drawing 1820 gallons and those at BRIEY (U-6873) 450 gallons of gasoline per day, in addition to other POL products.

Close cooperation between Civil Affairs Detachments in the field, Army G-5 and the Army Supply Services resulted in approximately 10,000 pairs of Class X shoes being allocated to AC of S, G-5, XX Corps for distribution to refugees; the discovery reported to the Army Quartermaster of several serviceable fuel storage tanks of 80,000 gallons capacity each; the release to XII Corps tactical units of eight tons of captured potatoes near ST NICOLAS.

TRANSPORTATION

The Civil Affairs Transport Pool, aided by trucks from the G-5 Transportation Pool and the 2d Platoon, Maintenance Company, performed 193 hauling missions and covered 258,000 miles during the month. Transport of refugees and displaced persons was handled, each from one to three times as they were moved first to collection points, then to displaced persons centers and finally to shipping points or to camps to the rear of the Army Zone. About 32,000 displaced persons were thus actually handled on all trips.

Assistance was rendered to the French Red Cross and French welfare organizations in eleven instances. These included the transport of workers to points where they were needed, evacuation of wounded and sick civilians from front areas and transporting civilian emergency patients from military hospitals to their homes.

Early in the month the French harvest was at its height, and in parts of the Army Zone the crops were threatened by frost damage due to lack of civilian transport facilities. In some instances, where food shortages threatened, Transport Pool trucks were loaned to communities to replenish their supplies. The amount of produce — chiefly potatoes, flour, grain, root vegetables and fuel — thus transported totalled more than 7,883,200 pounds for eighty-seven communities.

Transport Pool trucks delivered 370,000 pounds of food and relief supplies requisitioned by Civil Affairs Detachments and displaced persons centers. Trucks also hauled incoming supplies from the railhead at TOUL (U-61) to the warehouse at ST NICOLAS (U-9504).

Because the registration of captured enemy vehicles had been discontinued by order, maintenance of existing Civil Affairs vehicles became of first importance. The 2d Platoon, Maintenance Company handled sixty-four maintenance assignments, including twenty third and fourth echelon jobs. Fourteen of the Company's vehicles were loaned out, together with drivers to augment or relieve Detachment vehicles.

The Maintenance Patrol visited every Detachment in Army and Corps Areas twice during the month. It handled many small maintenance, adjustment and corrective jobs at Detachment headquarters. In addition to Civil Affairs organic maintenance, the platoon also serviced captured enemy vehicles assigned to Detachments, vehicles of the Mission Militaire de Liaison Administrative teams, trucks of the Civil Affairs Transport Pool and vehicles belonging to French liaison officers attached to staffs and Detachments.

More railroad transport was made available for civilian use during November. Details of shipments and routings were worked out by G-5 Transportation so that civilian supply movements would not conflict with military supply movements. Permission was obtained for subsistence trains to enter NANCY (U-81) daily instead of twice a week. By the end of the month trains were hauling more than 5000 tons of food, fuel and other essentials into NANCY alone. A total of twenty-three train movements involving food and fuel were arranged for other portions of the Third Army Zone. Large quantities of timbers, much needed for coal mine props, and salt were shipped out of the NANCY Region and schedules were approved for future shipments.

Eight railroad movements of displaced persons from centers to camps in the Communications Zone were handled that approximated 7,000 persons.

The work of reconditioning the canal system was slowed up by the abnormal amount of rainfall which flooded streams and made difficult the clearing of canal beds and the repair of locks and gates. In several cases, arrangements were made to change existing military bridges in order to remove pilings in the middle of the waterways.

AGRICULTURE

Fall harvesting of crops formed the major agricultural activity of the month. The most important problems which complicated the task were the lack of civilian transportation and, in some localities, lack of labor. Civil Affairs furnished transportation in many instances where crops were threatened with damage by freezing.

Crops planted by Germans were turned over to local authorities to harvest and distribute where most needed to relieve food shortages and care for refugees. Special efforts were made to recruit labor for harvesting the sugar beet crop. The towns of ST MAURICE (U-5049) and FAGNY (U-7444) solved mutual problems, the former exchanging flour mill facilities for a share of the latter's wheat, the details being worked out by Civil Affairs.

LABOR

Civil Affairs channels were used to recruit [illegible] problems arising in combat areas, such as burial [illegible] cleaning up of essential damaged buildings in [illegible] gangs of twelve men each were recruited to harvest crops in abandoned fields near devastated villages in the area of the 35th Infantry Division. Refugees and displaced persons continued to be used where necessary to relieve acute labor shortages.

DECLASSIFIED

SECTION VI

GOVERNMENTAL AFFAIRS

Political events which followed the liberation of the Department of MOSELLE and its capital, METZ (U-85), were interesting and significant. In 1940, MOSELLE was annexed by Hitler as a part of the REICH, and incorporated in the Reichsgau of WESTMARK. Strong measures were taken to bring the population and institutions into the greater REICH. The chief offices were filled by Germans, immigration from GERMANY into the area was promoted and military conscription ordered. The German language was designated as the official language, and schools and other institutions were brought into the German regime. The liberation of the area provided an unusual opportunity for testing the effect and influence of German measures, the ability of the French government to reassert its authority, and Civil Affairs operations under new conditions.

French and American troops were welcomed as liberators, and at METZ (U-85), French officials and religious dignitaries were received with enthusiasm. The visit of General Henri Giraud, the last French Military Governor before annexation, symbolized the change of authority.

The French government quickly reestablished its authority, by naming General Dody as Military Governor of METZ (U-85). For the purpose of civil administration the Department of MOSELLE was provisionally designated as a part of the Region of NANCY, under M. Chailley-Bert, Commissaire de la Republique, and M. Rebourset, Prefect of the Department. Subordinate officials assumed the exercise of their various administrative functions and, at the close of November, it could be assumed that French government was successfully established. Relations with the Army and coordination with G-5 Section were immediately effected.

In the Departments of MEURTHE ET MOSELLE, VOSGES and MEUSE, French authority broadened its scope. Its central organization was strengthened by changes of officials at several places. At NANCY (U-81) the Commissaire de la Republique announced the removal of the President, Vice President and Secretary-Treasurer of the NANCY (U-81) Chamber of Commerce and at BRIEY (U-67) the sub-prefect was removed. As an indication of its widened activities schools were opened as tactical units vacated billets, and railroads, canals and viaducts were repaired, technical advice being given by Civil Affairs specialists.

Active steps were taken to implement the provisions of the agreements between the French Military Government and the governments of the UNITED STATES and GREAT BRITAIN. On 1 November it was announced that the French government had assumed the payment of wages of all civilian labor employed by the United States Army within the Region of NANCY. Upon the recommendation of the AC of S, G-5, two Civil Affairs officers were designated to meet with representatives of the French government to adjust conflicting claims with respect to the ownership and disposition of fuel stocks held by the Army as German war material. This committee functioned throughout the month. An increase in the formulation and expression of political opinion was reported by various Civil Affairs Detachments, which was indicative of an awakened interest in government and the resurgence of traditional French individualism.

LEGAL

Numerous meetings were held with French authorities to clarify interpretations of the Anglo-French agreements, particularly as they affected requisitions by the Army of some 4500 tons of coal, coke and briquettes needed for heating hospitals and other installations. The usual factors involved in the determination of title were investigated and decision rendered as to status of property, i.e., captured enemy material or property owned by the French.

Numerous claims were presented for processing and forwarding to Communications Zone, for appropriate action. It was noted that instructions issued by this branch to Detachments in the field resulted in prompt investigation of alleged claims, and preserved for claims officers evidence upon which the validity of such claims

Digitized by Google

Due to a widespread illegal market in property of the UNITED STATES involving gasoline, rations, clothing, and other items of equipment, many conferences were held with the officials of the French Military Tribunal and the Procureur General de la republique. At these conferences, legal officers explained the importance of this equipment to our troops and the need for appropriate legal action to deter those parties found guilty, and to take severe further traffic in property of this type. The Anglo-French agreements were fully explained at these meetings, and an officer detailed to assist the French officials at every stage of the prosecution. This action resulted in speeding up the trial of civilian offenders and secured appropriate sentences for those found guilty.

To prepare for the operation and supervision of Military Government Courts in GERMANY, Military Government legal officers were further instructed as to their duties and were promptly informed of changes affecting jurisdiction of the courts. A close liaison was maintained with legal officers of the First and Ninth U.S. Armies in order to coordinate instructions to legal personnel and to provide a uniform system of court procedure throughout occupied GERMANY.

In order to maintain a complete record of legislation promulgated in occupied GERMANY, orders were prepared requiring a complete record as to time, place, and date of promulgation. To insure that the laws of Military Government would receive a widespread circulation in GERMANY, a request was made to Twelfth U.S. Army Group for facilities containing extracts of the most important provisions of all laws and notices.

FINANCIAL

Accounting reports from Detachments deployed in Army Zone reflected little change in cash positions as a result of the agreements whereby Civil Affairs relief supplies and captured enemy supplies were sold to the French on a deferred payment basis, and whereby the French took over payment of civilian employees of Detachments. The latter arrangement functioned well in the NANCY Region, but not in forward areas where the French had not sufficient time to set up the required administrative procedure.

A number of Detachments leaving FRANCE turned over their francs in excess to the Sub-Accountant of the G-5 section. Sub-accountant's balances at end of month was 1,846,509.30 French francs and 193,360 German marks.

Conferences were held with officials of the French Treasury and of the Bank of FRANCE, and assistance was rendered in connection with the conversion program of the French Government conducted in the section of METZ-VILLE Department liberated prior to 17 November. Forty-six exchange offices were opened and special arrangements made for refugees outside the Department of METZ-VILLE. German banks were demolished by civilians between 20 and 26 November and fifteen francs per mark were exchanged for the first 500 marks deposited. Unconverted balances were to be paid at the same rate in early 1945. Preliminary estimates indicated that between six and seven hundred million francs had been paid out in exchange for marks.

New areas in METZ-VILLE liberated in the latter weeks of the month were devoid of banking facilities. Every effort was made by the Financial sub-section to facilitate the work of French banking officials in reestablishing branches of French banks in these areas, and in preparing for conversion operations to be conducted in January 1945.

A report was received from officials of the Bank of FRANCE that the Germans had deposited checks and cash in the Bank of FRANCE, BELFORT (U-093), to cover cash taken from the Bank of FRANCE, NANCY (U-81).

The Financial sub-section cooperated with the Army Finance officer in the preparation of a directive covering the exchange of francs for marks for military personnel entering German territory. This directive (Subject: "German Money and Exchange Procedure," AG 123.7-"MARK, dated 22 November) included a description of the Allied Military Mark and a statement as to the types of money in GERMANY which would be accepted by Army Finance Disbursing Offices.

PUBLIC SAFETY

The importance of security measures in the Third Army Area was accentuated by the acceleration of military operations.

Before the attack of 8 November, an order was prepared by G-5 Section and issued by the Provost Marshal, prohibiting all civilian circulation in the Army Zone. Civil Affairs Detachments reported to the sub-section that certain necessary civilian traffic should be permitted. Following a conference, the order was relaxed by the Provost Marshal to permit civilian traffic in rear areas on non-military routes, and certain essential civilian traffic, including the movement of doctors, ambulances, and food supplies on military supply routes, upon issuance of an Army identifying sticker. Civil Affairs Detachments were directed by this sub-section to give full information of circulation restrictions to all recipients of passes.

In the Army Area, security measures were retained including the curfew from 2000 hours to 0600 hours. Frequent conferences were held with the Provost Marshal and Counter-Intelligence Corps with respect to traffic, circulation, and security problems.

After coordination with the Passive Air Defense Section of G-3, and conferences with French officials, air warning systems were organized in NANCY (U-81), SARRE-UNION (U-1122), and TOUL (U-61).

In NANCY (U-81), French authorities requested permission to resume street car service. This request was conveyed to the Provost Marshal by this sub-section and permission was granted.

Printing of proclamations and other legislation was ordered for the needs of Military Government Detachments.

PUBLIC HEALTH

Matters of sanitation and medical supply to displaced persons assembly points, together with the care of civilian sick and wounded, became acute problems in the wake of destruction of towns in forward areas.

Aided by additional French personnel, however, there were sufficient public health officers available to meet mounting needs. Two public health teams were assigned to cover XX Corps and VIII Corps Zones. Each team included one medical corps and sanitary corps officer, one medical supply officer, a dog veterinarian and typhus control officer. One of the medical corps officers acted as an employee of the operational staff. A French medical liaison officer was attached to the Army G-5 section, and six French medical officers were assigned to various displaced persons centers.

Typhoid fever, diphtheria, scarlet fever, dysentery, and scabies were the diseases principally reported. But, they were still endemic, and their incidence was insignificant in relation to their spread to the armed forces and to the civilian population. Another case of "typhus" was reported in the civilian hospital at THIONVILLE (U-A681), which proved to be another case of typhoid fever. Civil Affairs personnel were again cautioned in the difference between typhus exanthematique and typhoid fever.

Investigation revealed that a typhus fever epidemic had occurred in METZ (U-85) among foreign labor during the period 21 February to 10 July 1944. There were a total of sixty-one positive cases, seven doubtful cases, and four deaths. Cases were divided among six camps which harbored laborers from POLAND, GREECE, ITALY, RUSSIA and FRANCE. From the records of the health office in METZ, it was ascertained that immediate delousing was performed and that all camps were put under quarantine. Disinfection was performed by the steam method and the epidemic was effectively curtailed.

The typhus control officer visited all Detachments earmarked for displaced persons work in border-control centers and GERMANY for the purpose of organization and instructing dusting teams in each Detachment.

The Civil Affairs Supply Depot, under the guidance of an experienced medical supply officer, operated satisfactorily. An ASF basic medical supply unit was placed in the city hospital at NANCY (U-81). Request for medical supplies from civilian health agencies were directed to this source. Requirements for displaced persons camps were met from the Civil Affairs depot.

A letter of instruction on medical and sanitary [illegible] was published and distributed to Civil Affairs organizations. This letter explained methods of supply procurement and listed medical stocks available at Civil Affairs Supply Depot.

Two mobile medical teams were available in this Army's Zone of Operations through the Service de Sante. Each consisted of two doctors, three nurses etc are also drivers, and one ambulance complete with first-aid equipment. Their activities consisted of the care of civilian sick and wounded in combat areas and their evacuation to civilian hospitals. The Army Surgeon was advised of their availability, and he informed combat commanders that such service could be obtained through this headquarters.

A team was already on duty at MONTMEDY (G-1936). Another team serviced the DIEULOUARD (G-2524) area, and one was assigned to the XX Corps forward areas.

Maintenance of sanitation in displaced persons camps was extremely difficult. Facilities were usually inadequate, some not even approaching pre-occupied standards. These camps, however, were often the only ones available in emergency that could be utilized to get displaced persons and refugees out of the mud and rain. Because of pressure of evacuation from the front line, the camps were overcrowded. The constant movement to the rear every two to three days of occupants and the absence of discipline among them, made sanitary control a constantly recurring demand. To improve the situation, good internal organization was repeatedly emphasized and sanitary corps officers were appointed to camp operating Detachments to assist in the correction of defects. Considerable improvement resulted.

CHAPTER 7
DECEMBER OPERATIONS

SECTION I

GENERAL

With the swift shift in the tactical situation in mid-December, G-5 was confronted simultaneously with the civil problems of four nationalities under the stress of combat conditions. Approximately fifty Civil Affairs and Military Government Detachments were deployed in portions of FRANCE, GERMANY, BELGIUM and LUXEMBOURG. The entire Zone of the Army was being subjected to enemy action. It was sweet by a rising wave of fear of continued enemy successes. Civilian panic, with thousands of refugees clogging roads and hindering troop movements, might easily have developed had a hesitant policy been adopted.

No such panic occurred and at no time did civilians get out of hand, first, because of the confident attitude of Third U.S. Army troops, and second, because of the direct and positive nature of the civilian control measures that were inaugurated.

For more than two months, G-5 had maintained a heavy deployment of Detachments throughout the NANCY region against a possible emergency. Restrictions had been relaxed as the situation had stabilized, but nowhere had they been lifted despite a growing civilian insistence in the Army Area. This machinery was at once set in motion in coordination with AC of S, G-2, and the Provost Marshal.

Orders were issued cutting the granting of all civilian circulation permits to the absolute minimum and freezing the population in place. Detachments were directed to suspend all circulation permits not of an emergency category and to have anyone employ auxiliary police for the strict control of travel and the guarding of vital installations against sabotage. The Gendarmerie was brought out in force.

Certain public work that had been authorized on bridges and civilian communications lines was halted. Detachments were dispatched to METZ (U-67) and to ETAIN (U-47) to control from those important highway centers all civilian movements in the northern part of the Army Area. Other Detachments were regrouped to suit the new disposition of Corps.

Both the XII and the III Corps moving into LUXEMBOURG and BELGIUM carried reserve Detachments to augment quickly the efforts of Detachments that were already in place there. The control policy which was proving effective in FRANCE was continued without change in these new portions of the Army's Zone of Operations, as well as in the Zone of the VIII Corps. The AC of S, G-5, of VIII Corps needed no instructions in this policy, in view of the earlier service of this Corps with Third U.S. Army in FRANCE.

Digitized by Google

DECLASSIFIED

At no time through this period were national [illegible] consideration in executing the primary objective, na[illegible] clear of civilians. The methods adopted were emp[illegible] every instance with the full cooperation of local [illegible] ritory was recovered, G-5 Detachments moved in alo[illegible] establish government. They also assisted in the billeting of troops. At VIRTON (P-41), BELGIUM, for example, billets were procured for 5,000 officers and men, and surveys were made for an additional 8,800.

In occupied German territory in the SAAR Basin, on the front of the XX Corps, the month opened with Military Government Detachments engaged in restoring order to a largely desolated countryside that was still under enemy fire. For tactical reasons this work was abruptly abandoned and wholesale evacuation of the scattered population was begun to concentration points further to the rear of regimental lines. French-driven trucks of the G-5 Transport Pool, the Military Government staffs of combat divisions and troop commanders cooperated in this task. By the month's end it was largely completed.

Meanwhile, on the front then occupied by XII Corps but later relinquished to the Seventh U.S. Army, G-5 Public Health officers and trucks carried medical relief and food to several thousand French refugees trapped in a quarry between the lines near SARREGUEMINES (Q-55). A sound truck sent forward by G-5 Intelligence was instrumental in rounding up ninety-six German deserters there. Ten French drivers of the G-5 Transport Pool stood off an enemy attack against a temporary Civil Affairs storehouse until infantry help arrived, killing eight Germans and capturing eighteen.

At METZ (U-85) and elsewhere toward the rear, life in the Region of NANCY returned steadily nearer to normal with the resumption and expansion of the public services, improvement in the food supply, and returning efficiency of government.

SECTION II

PERSONNEL AND ADMINISTRATION

Organization of the 87th Infantry Division Staff during the month constituted the most important accomplishment other than routine administrative duties.

Civil Affairs and Military Government personnel appeared in casualty lists as follows:

1 Detachment missing
2 Individuals missing
5 Individuals wounded
1 Individual killed

The Croix de Guerre was awarded to the AC of S, G-5, XX Corps, and eight Bronze Star Medals were awarded to other Civil Affairs personnel for meritorious service.

SECTION III

INTELLIGENCE

The industrial importance of the SAAR River Valley to the enemy, the presence of a number of fairly heavily populated areas there, and the fact that the Army was invading German territory for the first time, made the SAAR of more than usual interest for intelligence purposes. Reports from Detachments, followed by first hand surveys made while the communities were still under fire, rapidly developed the pattern of the enemy's civilian policy through the valley.

Territory occupied on the German side of the SAAR River had been largely evacuated before the arrival of American troops. Complete evacuation had been ordered by NAZI leaders, but hundreds had stayed behind, hidden in cellars and elsewhere, upon assurance of German Army officers that the Americans would treat them fairly. Military Government staff officers found these people badly frightened, docile and tired of war. They willingly obeyed orders. However, all NAZI officials and Party leaders had fled, there was extensive combat damage and lack of all constituted authority. The countryside had been stripped of everything of military value excepting unthreshed grain and crops still in the ground. Displaced persons were few and presented no immediate problem.

On the French side of the river, only the German nationals had fled. An estimated 10,500 persons, chiefly French, were found in the city of SARREGUEMINES (Q-55) out of a normal population of 15,000. Some had been hiding in cellars under shell fire for almost three weeks. Some 3,500 were trapped in a quarry between the fighting lines. People were badly undernourished, many were ill, but there was no evidence of epidemic. Use of a sound truck procured by the Intelligence branch resulted in the turning over of ninety-six prisoners of war to the American military authorities.

An underground airplane parts and liquid air factory at WITTRING (Q-5650) had been emptied of all movable machinery and dynamited. Modern telephone equipment in larger centers had been moved out with the Germans. But the important coal mining and electric power center near ST AVOLD (Q-2456) was less seriously sabotaged than anticipated. Some of the mines had evidently been worked to the last hour.

Further steps were taken to coordinate more closely the displaced persons work of Civil Affairs and Counter-Intelligence Corps. The location of all displaced persons camps, changing frequently with the flow of operations, were posted daily on the Counter-Intelligence Corps central map in G-2 Section. At the same time, locations both of Counter-Intelligence teams and displaced persons camps were periodically published for distribution to all interested personnel of both sections. Regular liaison was maintained with AC of S, G-2 to keep him informed as far as possible in advance of plans for moving displaced persons out of the Army Zone rearward.

COMMUNICATIONS

The Department of MEUSE was included in Zone B for communications. This permitted open post cards and letters to be sent to most Allied nations.

Telephone service for essential activities was restored in METZ (U-85), PONT-a-MOUSSON (U-7635) and THIONVILLE (U-88). An air-raid alarm system was installed in METZ. Telephone circuits for official intercity use were installed from NANCY (U-81) to BAR-le-DUC (U-1122), BRIEY (U-67), JARNY (U-6565), PONT-a-MOUSSON (U-7635) and TOUL (U-61). Important industries in the suburbs of NANCY were given telephone service from the NANCY switchboard.

PUBLIC WORKS

Arrangements were made with the French Bureau of Ponts et Chaussees for sanding military roads in icy weather and for removal of mud from roads. Reconstruction of the bridge at FROVILLE (U-8219) was started by the French.

Electric power generators in CARLING (Q-2562), KREUZWALD (Q-2467) and MOSELBACH (Q-3361) with a capacity of 50,000 kilowatts were repaired and placed in operation. Repair of the generators at KREUZWALD made it possible to resume coal mining operations. Power lines were repaired from KREUZWALD to METZ (U-85), thus restoring electricity to METZ and also from KREUZWALD to FAULQUEMONT (Q-1749).

Use of the military bridges at MALZEVILLE (U-8675), ST MAX (U-8713), TOMBLAINE (U-8810) and CHAMPIGNEULLES (U-8416) was authorized for gas lines from NANCY (U-81) to those communities, making gas available for the first time since liberation. Water pipes from NANCY to MALZEVILLE and ST MAX were repaired at the temporary bridges connecting the communities.

SECTION IV

PLANS AND OPERATIONS

Continuation of the Allied winter offensive placed a heavy burden on Civil Affairs, particularly in the Zone of this Army. The zone of advance was generally through Germanized ALSACE-LORRAINE.

When the Germans withdrew, they evacuated the civil authority and police agencies, took most of the food, and damaged utilities. This situation required the use of Civil Affairs [illegible] every little commu-

On 11 December, the III Corps was placed on an operational status with a Zone between the XII and XX Corps. For this operation, the following Detachments were placed under their control:

C2I2 H1A2
D3B2 D6D2
B1C2

With the build up of Sixth Army Group and resultant movement of their Zone to the North, seven Detachments were transferred to that organization. I6A2 and I1B2 went directly to XV Corps on 15 December, and G1B2, H2A2 and H1B2 departed for Sixth Army Group on the next day.

Six Detachments scheduled for return to European Civil Affairs Division had been retained for operational reasons, but because of a more pressing need elsewhere, Twelfth U.S. Army Group relieved them from attachment to this headquarters and they departed on 19 December.

The Germans launched their expected counter-offensive in the Zone of the VIII Corps, First U.S. Army on 16 December. The Third U.S. Army moved north immediately to attack the flank of the German salient.

Initially there was unrest among the civil population of LUXEMBOURG, BELGIUM and Northern FRANCE, but all Civil Affairs and Military Government Detachments immediately enforced a standfast policy with the result that rapid military movement was not impeded by refugee circulation.

The VIII Corps was assigned to the Third U.S. Army to meet this counter-offensive, and as a result, eighteen Civil Affairs and Military Government Detachments passed to control of this Army.

On 31 December, thirty-nine Detachments were operating in the following towns:

Third U.S. Army Control

ANGEVILLERS (U-7899)
BRIEY (U-6973)
CHATEAU SALINS (Q-1026)
CLERVAUX (P-7663)
DELME (Q-0132)
DOMBASLE (U-9804)
ESCH (P-7301)
ETAIN (U-4770)
HAYANGE (U-7783)
LOMENY (P-5704)
MAIZEVILLE (U-8713)
MERLEBACH (Q-3261)
MONTMEDY (U-7774)
NANCY (U-8512)
SARREGUEMINES (Q-4155)
SCHIFFLANGE (P-7502)
TOUL (U-6410)
PONT-a-MOUSSON (U-7635)

XX Corps Control

BOULAY (Q-0965)
KREUZWALD (Q-2467)
DIEUZE (Q-2524)
HEMMERSDORF (Q-1885)
METZ (U-8757)
MERZALTDORF (Q-1783)
PERL (Q-0298)
SAARLAUTERN (Q-2981)
SIERCK (Q-0094)
THIONVILLE (U-8687)

XII Corps Control

CAPELLEN (P-7418)
LUXEMBOURG CITY (P-8413)
MERSCH (P-8285)
MOUTFORT (P-9311)

III Corps Control

ARLON (P-6222)
REDANGE (P-6732)

VIII Corps Control

BERTRIX (P-2242)
CARIGNAN (P-1418)
FLORENVILLE (P-2525)
NEUFCHATEAU (P-3541)
ETALLE (P-4622)

Detachments D4D2 and D5B1 awaited orders for transfer to Sixth Army Group for border control duty at SARREGUEMINES (Q-4155) and FORBACH (Q-3966) respectively, in accordance with the Plan for Disposition of Civil Affairs Detachments, dated 22 November.

Digitized by Google

REFUGEES AND DISPLACED PERSONS

The continued mass movement of displaced persons rearward into Communications Zone, the uncovering of sizeable numbers of refugees in caves and quarries near the front, and the evacuation to and concentration of German civilians in towns near [illegible], were among the more noteworthy developments during December.

The total number of displaced persons in Transit Points and the numbers evacuated by train and C-5 truck transport are given below:

DATE	DPs IN TRANSIT POINTS	DPs EVACUATED DURING MONTH
4 December	3,988	2,487
10 December	2,[illegible]9	668
17 December	2,[illegible]8	226
25 December	4,[illegible]4	1,752
31 December	2,735	1,624

The following Transit Points were in operation or available for use during the month:

[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible] (U-7635)	[illegible] (U-4413)
[illegible]	[illegible]
[illegible]	[illegible]

The total number of refugees and displaced persons reported as of 31 December was as follows:

CHANGE	MILITARY	DPs
HAUTE PRIN	120	
[illegible] IT MESPLE	13,029	1,845
[illegible]	1,110	
[illegible]E	22,[illegible]06	1,224
V[illegible]GES	26	
MM. AT DP TRANSIT POINTS		1,330
GERMANY	6,346	277
LUXEMBOURG	3,885	466
M[illegible] AT DP TRANSIT POINTS		1,605
BELGIUM	1,540	
GRAND TOTAL	50,962	6,547

Thirty-two hundred refugees, mainly former residents of SARREGUEMINES (U-455), but including a small number of German civilians and displaced persons, were uncovered in a quarry near that town. The entrance was under heavy shell fire but the Civil Affairs detachment, aided by personnel from a tactical unit, succeeded in delivering food and medical supplies to the group.

Nine hundred sixty-seven German civilians were evacuated from a large cave in [illegible] (U-2451), 400 were moved to [illegible] (U-1681) and the remainder to [illegible] (U-1885). Other concentrations of evacuees were at [illegible] (U-1880) and NIEDALTDORF (U-1783) with approximately 1,112.

Border control Detachments were moved to THIONVILLE (U-4681), METZ (U-48), BITCHAT (U-4465), and SAARBRUECKEN (U-55). These Detachments performed regular Civil Affairs duties in their respective towns, including some work with displaced persons and refugees. It was clear, however, that border control work as originally conceived would come at a later date.

The work of returning mayors and auxiliary police to towns begun in November was continued. Assistance in rehabilitating the towns and return to them of former residents was also continued by the Military Government Detachments deployed for this purpose.

All the displaced persons teams were activated. After careful consideration, it was decided to waive Service Red Cross representatives from such teams and with two exceptions, these representatives were attached to Military Government/Civil Affairs Detachments in the larger towns. Four Polish liaison officers reported for duty and were immediately deployed to Displaced Persons Detachments.

SECTION V

RELIEF AND SUPPLY

Efforts made during November to have supplies shipped forward from Communications Zone bore fruit. The following supplies, with additional quantities due in, were received during December at the Civil Affairs Depots:

ITEMS	TONS
Food	197.66
Clothing	91.67
Blankets	44.43
Soap	120.2

In addition, 7,500 "C" rations were received from the Army Quartermaster as reimbursement for food supplied to Prisoners of War during the month.

Operations involved the issuance of:

ITEMS	TONS
Food	63.3
Clothing	10.52
Blankets	15.33
Soap	13.6

leaving the following balance on hand:

ITEMS	TONS
Food	171.07
Clothing	81.65
Blankets	34.1
Soap	109.1

A total stock of 1,000 tons was set as a desirable reserve to be available for future operations. An additional warehouse at NANCY (U-7783) was occupied, and further attempts were made to secure dead storage space.

Captured foodstuffs played an important role in meeting civilian relief needs. Quantities of grains and potatoes turned over to civilian authorities in this zone were large, that for the METZ area alone totalling about 350 tons. Of more permanent significance were the many measures taken both by military and civilian authorities toward the rehabilitation of grain processing plants.

The distribution of POL products to civil authorities was modified to meet the requirements of newly uncovered areas in the Department of MOSELLE. The POL allocation at [illegible] (U-467) was discontinued and are diverted to NANCY (U-81) so that there would be a completely centralized distribution for the entire Army Zone. The NANCY regional authorities continued making regular distribution through departmental authorities of the 2,270 gallons of gasoline and 540 gallons of other POL products drawn daily from the Army.

Indicative of the frequent supply activity carried on with units outside of Civil Affairs were arrangements made to secure eleven tons of captured "Master of Paris" through the Seventh Air Depot Group of the Army Air Forces for the repair of government buildings at [illegible] (U-467) and the supplying of clothing and blankets for 2,300 Allied Prisoners of War in an understanding with the Quartermaster.

For the guidance and assistance of subordinate units, a supply circular was issued giving current information on Civil Affairs stocks available at the depots and the most recent modifications of procedure. Study was made of supply facilities and procedures to be followed in GERMANY, with the intention of issuing a concise letter of instructions on these matters to Corps and Detachments under Army.

TRANSPORTATION

The Civil Affairs Truck Pool Number 2 was established in connection with the new Civil Affairs Supply Warehouse at [illegible] (U-7783). The 1st Company of the French Provisional Truck Unit, consisting of fifty trucks, five officers and [illegible] men was moved to NANCY to operate Pool Number 2. The 12th Company remained at ST NICOLAS (U-9504) to operate Pool Number 1.

The second pool materially increased the efficiency of transport as it shortened hauls of supplies and made possible quicker service to Detachments. As a result, more hauls were made with a substantial decrease in total mileage. Bad weather conditions, cold, ice and rain - handicapped truck movements and caused a substantial proportion of trucks to be deadlined for minor repairs. In spite of this, 145 missions involving 556 separate trips were performed.

Refugees and displaced persons accounted for an important proportion of the truck movements. In all, over 4,000 refugees and more than 20,000 displaced persons were carried in Civil Affairs Transport Pool vehicles, including individuals who were carried two and three times.

Transport Pool trucks carried a total of 635,800 pounds of Civil Affairs supplies. Food and clothing to establish Warehouse II were carried by the Pool trucks. Several trips were made to depots in the Communications Zone to bring un needed medical and sanitary supplies to the warehouse at ST NICOLAS (U-9504).

Assistance to local Detachments continued to be a major function. Trucks were loaned for periods of three to five days to be used in local hauling, such as bringing in local food to centers and damaged towns, evacuating sick and wounded civilians and transporting other essential and badly needed commodities. One hundred and thirty tons of clothing were hauled for the Red Cross. In all, the Civil Affairs Transport Pool trucks carried more than 5,331,000 pounds for Detachments and communities.

With the resumption of activity on all fronts, Transport Pool drivers were called upon to evacuate civilians from front lines and to deliver supplies under fire. Ten drivers of the 12th Company assisted in repelling a German attack on the Civil Affairs supply distribution point in [illegible] (U-55). Special commendation was expressed both by the XII Corps and Army AC of S, G-5 for the drivers "courage, indefatigable efforts and willingness to carry out assignments despite the risks involved." Two drivers were wounded by shrapnel while rescuing civilians at [illegible] (U-[illegible]). Both truck companies were commended for meritorious service by AC of S, G-5, of the Third U.S. Army.

The Second Section, Service Platoon, though losing twenty men, performed 174 repair operations on Civil Affairs and Military Government vehicles. The Maintenance Patrol checked vehicles of all Detachments twice during the month.

Railroad transportation continued heavy and every effort was made to obtain shipment of necessary civilian goods without interfering with essential military traffic. During the month clearance was obtained to bring 13,792 tons of food, 15,823 tons of fuel and 2,545 tons of medical supplies and essential merchandise into NANCY (U-81). In other portions of the Army Zone, arrangements were made for the shipment of 12,310 tons food, 14,916 tons fuel and 12,623 tons of miscellaneous merchandise. Outgoing shipments which were cleared totalled 11,202 tons of salt and soda, and 1,752 tons of timber for use in coal mines.

Arrangements were made for the resumption of rail service to additional communities and recreation centers. In all, sixteen trains were authorized to make one trip and return each week between various towns and cities. The trains were to carry food and essential commercial items, but no passengers or mail.

Authorization was obtained for the passenger express previously operating between PARIS and RAS-le-DUC (U-1122) to extend its service from RAS-le-DUC to NANCY (U-81). Only passengers who had received clearance from the Counter-Intelligence Corps and Civil Affairs were permitted to use the train after entering Third Army Zone.

Arrangements were completed to permit two cars per week of medical supplies and clothing to enter NANCY (U-81). Special train movements were authorized for the transport of 500 tons of railroad supplies, 6,000 tons of coal, 2,02[illegible] tons of food, and 1,200 tons of steel, in addition to the regular subsistence train shipments.

Five train movements were arranged to transport displaced persons from displaced persons camps to centers in the Communications Zone. Approximately 5,000 displaced persons were moved by rail.

Permission was given for the resumption of street car service in NANCY (U-81) on three important routes which did not interfere with the main military supply routes. Later permission was also given to extend tramway service as far as FROUARD (U-8219). Trolley service was allowed to be reopened between NATANCE (U-7783) and THIONVILLE (U-68) and resulted in eliminating much foot and bicycle traffic on military roads.

Digitized by Google

DECLASSIFIED

Rehabilitation of canals in the Army Zone was prevented by lack of some essential materials and shortage of labor. Cold weather and the floods caused by unusually heavy rainfall also contributed to the slowing down of repair efforts.

LABOR

A complete survey of available labor was made at THIONVILLE (U-68). French labor offices were functioning and unemployed factory workers were being employed on clean-up and rehabilitation work.

A new registration of labor was held at ST AVOLD (Q-2456) to find men for essential civilian and military work.

More than 1,000 laborers were obtained by Civil Affairs for the 72d Quartermaster Base Depot at ESCH (P-7301).

SECTION VI

GOVERNMENTAL AFFAIRS

Governmental affairs requiring the consideration of the branch arose in great part in FRANCE.

As the area occupied in GERMANY was small and those in BELGIUM and LUXEMBOURG were subject to battle conditions, it was difficult to assay the quality and permanence of governmental organizations established locally. The chief interest of the branch with respect to GERMANY related to the accumulation of Military Government laws and the establishment of Military Government courts for their enforcement.

French administration in the Army Zone was marked by the progressive reestablishment of its functions in the Department of MEURTHE and the enlargement of functions in the Department of MOSELLE-et-MOSELLE. In the latter Department, active cooperation with the Army Legal subsection was noted in matters relating to suppression of the black market and with the Public Safety sub-section in the enforcement of security restrictions.

At the beginning of the German offensive, the French authorities gave great aid to the Army by strict enforcement of security measures and in the reassurance of the apprehensive French population.

LEGAL

Cases involving possession, theft, and illegal traffic in property of the UNITED STATES such as gasoline, rations, clothing and equipment, were reduced to a minimum. An effort was made through the French officials concerned to impress the civilian population with the seriousness of the situation. In line with this, a newspaper editorial was published explaining to the people that it was an offense against French law to take possession of American property even though such property was received as a gift. It was further explained that soldiers of the Allied Forces had no authority to dispose of any property of the UNITED STATES.

To coordinate the activities of Army agencies and the law enforcement agencies of the French administration, a legal officer was placed on special duty with the Civil Affairs Detachment in NANCY (U-81). This officer was thus able to receive reports of violations, prefer charges, and follow the trial to its completion. This action resulted in prompt trial of offenders and more severe penalties.

For some time the French had been under the impression that the civil courts and the French Military Tribunals had concurrent jurisdiction with respect to civilians in cases involving offences against persons and property of the Allied Governments. The resulting confusion led to delayed trials and sentences incommensurate with the offence. A conference was held with the Inspector of French Military Tribunals, as a result of which the French Military Tribunals sitting in the Region were instructed to exercise sole jurisdiction over all cases involving the interest of the [illegible]

There was a marked decrease in the number of claims presented for processing and forwarding to Communications Zone for action. Civil Affairs Detachments were instructed in Army Procurement procedures. This removed a potential source of claims arising out of improper requisitioning by units unfamiliar with directives on that subject.

The status of all controverted property rights were investigated and reports rendered to the sections concerned for disposal under the agreements between the Allied Governments. The reports of these investigations were forwarded to higher headquarters for settlement under existing agreements for balancing of accounts.

The occupation of portions of German territory necessitated the promulgation of the laws for the government of GERMANY under Military Government in the Supreme Commander's Area of Control. These laws, ordinances and notices were published in all towns of the occupied area. A complete distribution of pertinent legislation was made to all Corps, Divisions and Military Government Detachments for use in the areas under control.

On 1 December the Army Commander's authority to appoint Military Government Courts was delegated to the Corps Commanders with authority to redelegate the authority to Division Commanders. As a result eight Summary Military Courts were appointed in the Army Zone. These courts tried a total of twenty-three persons charged with such offences as violations of circulation and curfew restrictions, crossing the frontier, and failing to declare weapons in the appointed time. Sentences ranged from seven days imprisonment to one year imprisonment and $500.00 fine.

FINANCIAL

Detachment receipts and expenditures of Civil Affairs funds continued to decline as labor, supplies and services, in all but extreme forward areas in FRANCE, were furnished through local authorities or Army channels. Payments due Detachments were handled on a deferred basis at national levels. The bulk of the French francs held by the Sub-Accountant, G-5 Section, was transferred to Currency Section for FRANCE. Balances at the end of the month were 119,237 French francs and 193,350 Allied Military marks.

To conform with Procurement Directive Number 23, this headquarters, 23 December, arrangements were initiated to secure appointment of Purchasing and Contracting officers on all Military Government Detachments. This directive prescribed that all supplies, services and facilities required by Military Government Detachments in GERMANY would be secured only by duly appointed Purchasing and Contracting officers.

A reluctance on the part of shopkeepers in NANCY (U-81) to accept supplementary franc notes in denominations of 500 and 1,000 francs developed during the month as a result of a counterfeit scare. At the request of this headquarters, French authorities inserted notices in local papers to calm the population. At the same time, arrangements were made with the Bank of FRANCE to exchange 500 and 1,000 franc Allied Military notes held by Army Finance Sections for metropolitan francs. Within a few days these measures proved successful and there were no further reports of trouble.

Entry of French financial and banking officials into liberated areas of FRANCE west of the MOSELLE River was facilitated to reopen banking and financial services and to prepare for the conversion of marks into francs scheduled for the second week of January 1945. Additional copies of the French proclamation on the exchange rate were posted by Civil Affairs Detachments in areas affected. Despite efforts of Finance officers, some Allied Military marks found their way into circulation in frontier sections in the Department of MOSELLE. At the request of this Section, the Army Finance officer reported this matter to the Commanding General, European Theater of Operations, so that arrangements could be made with the French Government to redeem Allied Military marks in the hands of civilians.

Authority was obtained for the Bank of FRANCE, NANCY (U-81), to use certain important telephone circuits. Their operations had been hampered by lack of adequate facilities for [illegible]

The rapid extension of operations into LUXEMBOURG and BELGIUM, toward the end of the month, resulted in a renewed appearance of military personnel in these countries who had been unable to exchange their French francs for the appropriate local currency. This situation was brought to the attention of the Finance officer and steps were taken to place Finance Disbursing Sections at key points to exchange currency for military personnel.

In Luxembourg and Belgian cities, where the German counter-offensive threatened the safety of treasury and banking funds, Civil Affairs Detachments issued instructions for removal or safeguard of these funds in case of emergency.

In occupied territory Military Government Detachments had little to report in the financial and property control field because of the suspension of most normal civil functions.

PUBLIC SAFETY

Prior to the German offensive, Public Safety activities were concerned chiefly with the consideration of passes requested for forward areas and conferences with the Provost Marshal, the Public Safety officer of Civil Affairs Detachment A102, and French authorities with respect to security measures.

The offensive led to additional emphasis upon security control. The French Police were warned of the possibility of infiltration by German spies and saboteurs and requested to exercise stricter enforcement of circulation, blackout and curfew controls. During the Christmas season, additional guards for NANCY (U-81) were requested, and furnished by the French authorities. The policy was adopted of refusing approval of passes into Corps and Division areas except in cases of great urgency and necessity. In all of these measures, full cooperation was received from the French authorities.

A single relaxation of control was permitted for Christmas Eve, when at the request of this sub-section, the curfew hours were changed from 2000 hours 24 December to 0100 hours 25 December in that part of the Army Zone west of the MOSELLE River. This relaxation had been requested by Monsieur P. Chailley-Bert, Commissioner of the Republic, and the Bishop of NANCY to permit the celebration of the traditional midnight mass.

French authorities in NANCY (U-81) were requested to hold a practice air-raid alert with fire guards and watchers at their posts. The alert was held on 30 December and was carried out quickly and successfully.

PUBLIC HEALTH

Care of civilian sick and wounded, especially in the devastated forward areas, developed into an important activity. However, there was no unusual rise in communicable disease incidence in the Zone of Operations, and no great demand was made for medical supplies from civilian agencies.

An Allied Relief Board basic medical unit was established in METZ (U-85) to supply the needs of civilian installations in the MOSELLE area. One thousand pounds of DDT powder, 250 hand dusters, and one power duster were stocked in the Civil Affairs Supply Depot.

Three mobile civilian medical teams were operating in the Army's Zone. They serviced the entire forward areas, giving first-aid to the civilian sick and wounded and evacuating the serious cases to civilian hospitals. The principal towns served included THIONVILLE (U-68), SIERCK (Q-0095), BOUZONVILLE (Q-1378), METZERVISSE (U-9581), BOULAY SARREALBE (Q-4845), SARREGUEMINES (G-55) and MORHANGE (Q-193A).

An ambulance service was also attached to this headquarters by arrangement with the Ambulance Assistance Sanitaire. Their service involved the evacuation of sick and wounded from forward areas to civilian hospitals on call from Civil Affairs officers and Army Commanders. This service filled a definite need. From [illegible]

Digitized by Google

Arrangements were made through Twelfth Army Group for hospitalisation of chronically ill patients from displaced persons camps and civilian hospitals to civilian hospitals in rear areas in order to provide more bed space in forward areas for acute illnesses. The ambulance service transported thirty-eight tuberculosis patients from ALGRANGE (U-7768) to a civilian hospital at HUMAIZE-les-BAINS (T-9325).

On duty with this headquarters, a Public Health officer arranged a relief party to bring food and medical supplies to French refugees in a cave at WELFERDING (Q-4956). The party was under fire while carrying out this mission.

Several hospitals were rehabilitated in the forward areas. Medical supplies, equipment, and blankets were furnished the hospitals at SARREGUEMINES (Q-55) and MERLEBACH (Q-6361).

With the reduction of the number of refugees and displaced persons, public health problems at these camps diminished. The camps possessing worst sanitary facilities were abandoned. The other camps improved considerably in sanitary standards and a few were exemplary.

CHAPTER 8
JANUARY OPERATIONS

SECTION I

GENERAL

Destruction and destitution were widespread in the wake of the German Army as it was forced backward out of the ARDENNES. This was agricultural country on which the more populated areas to the south depended heavily for their food supply. The Germans practically denuded most of it, seizing large quantities of food and clothing to support their troops in the field and taking hundreds of head of livestock back into GERMANY. More hundreds of head were killed by the military action or died of starvation and lack of care. The result was that the civilian relief problem in January extended throughout the Zone of the Third US Army. It was made acute by severe winter weather and a general shortage of fuel.

Approximately 180,000 garments donated by the American Red Cross were distributed among 90,000 destitute persons in the Grand Duchy of LUXEMBOURG, the Province of LUXEMBOURG in BELGIUM, and in the French Departments of MEURTHE-et-MOSELLE and MEUSE. The clothing was hauled in G-5 Section trucks and its distribution, chiefly through civilian agencies, was supervised by American Red Cross personnel attached to Civil Affairs Detachments.

The Relief and Supply Branch issued approximately 1,040,000 rations of imported emergency foodstuffs and 187,000 gallons of gasoline and lubricants. The petroleum products were employed in large part to get local mills in operation grinding wheat, loss of which was threatened through spoilage, and in enabling local trucks to collect fodder for starving farm animals.

G-5 Transport Pool trucks carried more than 1,000 tons of materials. They rushed twenty tons of food into BASTOGNE (P-55) upon the relief of that town, evacuated 3,000 persons from combat areas, and over icy roads carried 750 Polish displaced persons to CHALONS-sur-MARNE (T-4445) without an accident. Fifty tons of salt was carried into LUXEMBOURG CITY (P-81) to relieve a serious shortage there.

The relief policy followed was one of furnishing purely emergency supplies for the first few days until the regular civilian agencies could take over the burden. Every assistance was given in assisting Belgian and Luxembourg state authorities in surveying their devastated areas and determining the needs. Generally, the large numbers of refugees who had fled from the German attack to the south were held in place there, only picked groups of men being allowed to return to their towns for salvage and clearance operations where this work was desirable.

The growing threat of epidemic, especially of diphtheria, was met by providing emergency medical supplies where needed, and avoiding overcrowding of civilian hospital facilities. In all instances reported outbreaks of disease were brought quickly under control.

SECTION II

PERSONNEL AND ADMINISTRATION

With the steady change from Civil Affairs to Military Government and the deployment of additional Detachments, the volume of reports and correspondence increased greatly.

Non-table of organization grades listed below were allotted to this Headquarters for Civil Affairs/Military Government activities only, by Headquarters European Theater of Operations:

Officers		Warrant Officer	Enlisted	
Colonel	- 2	1	Grade 1 -	3
Lt. Colonel	- 7		Grade 2 -	7
Major	- 10		Grade 3 -	13
Captain	- 5		Grade 4 -	9
	24	1	Grade 5 -	8
				40

Aggregate - 65

The Theater Commander directed that upon transfer of this Headquarters from the theater or in the event that it should become non-operational, the allotted grades would be withdrawn and assigned personnel would be reassigned to the European Civil Affairs Division. Army G-5 Staff was reduced from fifty to forty enlisted men in compliance with the order.

The 76th Infantry Division, assigned to Third U.S. Army during the month, arrived without a Civil Affairs/Military Government Staff. Competent officer and enlisted personnel from other staff sections, possessing several months of operational experience, were assigned to this new division.

Instructions of new procedure for processing recommendations for promotion of Civil Affairs/Military Government Detachment personnel were received from European Civil Affairs Division. Because of an overstrength in grades, few promotions of qualified and deserving Detachment personnel had been made up to this time.

Three Civil Affairs/Military Government personnel were wounded as a result of enemy action.

Seventeen Bronze Star Medals were awarded to Staff and Detachment personnel during January for meritorious service.

SECTION III

INTELLIGENCE

Surveys made through Civil Affairs personnel in the recaptured areas of BELGIUM and LUXEMBOURG indicated that necessity was probably the chief reason for the enemy's wholesale seizure of foodstuffs, clothing and other materials in the "break through." Few atrocities against civilians and little wanton damage were reported. However, property was seized indiscriminately, usually without requisition. Actual looting appeared to have varied according to the degree of discipline maintained by enemy unit commanders.

Detailed claims filed with mayors of nine communes in the area around ST HUBERT (P-3061) showed that every available kind of portable property was seized, though otherwise enemy troops were said to have been "quite correct in their attitude and actions." They took more than 85,000 kilograms of potatoes, 53,000 kilograms of cereals, 78,000 kilograms of straw, 50,000 kilograms of coal, 800 head of livestock, 4,300 chickens, and 14,000 bottles of wine, liquor and beer. They made large hauls of bedding, clothing and white goods for sanitation, and practically cleaned the country of tobacco and hand tools. Looting was indicated by claims for 263 watches and clocks, 395 pieces of jewelry, 13 musical instruments, 1,492 books, 236 radios, and 618 pieces of furniture. Citizens claimed to have been robbed of 3,650,000 Belgium francs in cash. The "POL" loss was only 4,500 liters, about half of which was kerosene.

Other villages of the salient had experiences and losses very similar to those of the ST HUBERT communes. Civilians said that livestock, especially cattle, were sent back into GERMANY by the hundreds of head. NEUFCHATEAU (P-6172) was thoroughly pillaged during the seven air raids that destroyed it, the enemy's first interest being in blankets and clothing.

The Courier-Liaison Service was maintained under difficulties with all Corps and Army Area Detachments, troop movements and winter roads prolonging schedules. Close liaison with the AC of S, G-2, resulted in ready coordination of G-2 and G-5 mutual interests for operations in GERMANY.

COMMUNICATIONS

Intracity mail for civilians and intercity courier service for official business (including postal money orders) were resumed in the Duchy of LUXEMBOURG and the section of BELGIUM in the Army Zone. These services had been suspended coincident with the German offensive in December. Civilians of the Department of MEURTHE-et-MOSELLE were authorized to send letters up to twenty grammes to that section of FRANCE in Zone B.

Repair of overhead telephone wires by employees of the Luxembourg, Belgian and French "PTT" was resumed.

PUBLIC WORKS

Army Engineers removed mines to permit repair of the ECKARTE (U-8679)-CATTENOM (Q-2562) high tension electric power line.

Electric power was restored in fifteen communes in the vicinity of NEUFCHATEAU (P-3642), nine communes in ETTELBRUCK Canton and also in the following localities:

BISSEN (P-7933)	HAMPTSCHART (P-3940)
FELS (P-9132)	NEUFCHATEAU (P-3641)
GRAFFMTAINE (P-3238)	PERLE (P-5837)
HEINSPANGE (P-8509)	RUMELANGE (U-7798)
MANTELANGE (P-5639)	ST AVOLD (Q-2456)

MERSCH (P-8328)

An electric power generator of 25,000 kilowatt capacity was put in service at CATTENOM (Q-2562). This made more power available for METZ (U-85) and the coal mines in the Department of the MEUSE.

The power line from METZ (U-85) to WOIPPY (U-8563) was repaired. This permitted operation of an additional water pumping station for METZ.

SECTION IV

PLANS AND OPERATIONS

Regrouping of Detachments was effected so that each Corps would have nine Detachments available if needed. Those Detachments under operational control of Corps were engaged in securing covered accommodations for troops, organizing groups of civilians to bury dead civilians and animals, providing for movement of refugees and cattle out of devastated areas and general rehabilitation.

Because of increase in the Army frontage, the number of specialist Detachments for handling displaced persons and refugees was increased from five to ten. Five very mobile Detachments designated as Collection Detachments were organized to handle movement of civilians from forward areas to camps in the rear. In addition, five Detachments designated as Transit Camp Detachments were organized. One of each type of Detachment was placed in each Corps Zone and one of each type was retained in the Army Area.

On 31 January, Detachments were operating in the following towns:

ARLON (P-6222)	LONGWY (P-5704)
BASTOGNE (P-5558)	LUXEMBOURG CITY (P-8413)
BISSEN (P-7933)	MANTELANGE (P-5639)
BITBURG/VILLE (Q-1377)	MERSCH (P-8328)
BRUEY (U-6973)	METZ (U-8757)
CATTENOM (P-7318)	MONTMEDY (P-9402)
CLERVAUX (P-7063)	NEUFCHEF (P-8615)
ECHTERNACH (Q-2468)	NEUFCHATEAU (P-3641)
DIEKIRCH (Q-1266)	NEUFCHATEAU (P-3541)
ESCH (P-7301)	PERL (Q-0298)
ETAIN (P-4770)	RUMELANGE (P-6732)
ETTELBRUCH (P-8240)	THIONVILLE (U-7497)

REFUGEES AND DISPLACED PERSONS

Destruction of homes in the area of the German offensive forced thousands of refugees southward, filling many towns to the point of congestion. Thus, although the shift in the Army Zone resulted in the elimination of many refugees in territory previously under the Army's control, it added many others in the new territory taken over.

The displaced persons problem decreased in intensity. As the result of a long static period, the majority of displaced persons had been evacuated and very few continued to come through the lines. The period was employed to collect small scattered groups of displaced persons who had up to this time presented a relatively small problem until the farm work ended. These groups were evacuated to the rear.

New operating instructions were presented and issued during the month. This plan established ten Displaced Persons Teams. One team was made available to each Corps for the collection and evacuation of displaced persons and refugees in forward areas, and one to each Corps for establishment and operation of a Transit Center in the Corps Zone and for other service in the specialized field of displaced persons and refugee work. The detachment operated camps in the Army area and handled evacuations into the Communications Zone.

Conferences were held with Corps G-5s and Detachment Commanders of the teams involved for the purpose of orientation in the new plan.

The numbers of displaced persons in Transit Points and the numbers evacuated during January were as follows:

	Displaced Persons in Transit Points	Evacuated
7 January	1,006	1,340
14 January	2,455	0
21 January	1,454	1,076
31 January	2,400	714

The following Transit Points were available or in operation during the month:

Location	Capacity
DOMBASLE (U-6961)	800
HAYANGE (U-7783)	2,000
LIBRAMONT (P-3168)	1,500
LUXEMBOURG (U-[illegible])	500
ORLEANS (P-[illegible])	450
ROMILLY (P-[illegible])	600
THIONVILLE (U-[illegible])	800
MARLENHEIM (U-[illegible])	400
PONT-A-MOUSSON (U-[illegible])	400
ST JACQUES (U-7783)	600

The total number of refugees and displaced persons reported as of 31 January was as follows:

	Refugees	Displaced Persons
FRANCE	1,316	27,150
GERMANY	196	6,830
LUXEMBURG	434	25,446
BELGIUM	227	34,456
Total	2,133	94,476

SECTION V

RECEIPT AND SUPPLY

The change in Army Zone boundaries resulted in the decision to [illegible] Army Supply Depot at ST NICOLAS de PORT (U-9504), HAYANGE (U-7783), where the depot was established [illegible] and under the [illegible] Corps Zone. [illegible] Civil Affairs Regiment, was relieved of all responsibility for depot [illegible].

Close telephonic liaison with Supply sub-section of G-5, Communications Zone, made for a mutual understanding of Civil Affairs Supply problems and produced a more regular flow of supplies from the rear than had been attained at any time in the past. The quantities received necessitated the acquisition of additional storage space in FLOCHANGE (U-6482) near HAYANGE.

The following tabulation summarizes the movement of relief supplies during the month:

(All Figures in Net Long Tons)

	Food	Clothing	Blankets	Jan. Sup. & Soap	POL
On hand 1 Jan.	201.83	74.84	16.78	109.10	0.00
Received during Jan.	1026.25	7.49	41.83	85.22	668.97
Issued during Jan.	825.35	5.77	11.44	45.22	668.97
On hand 31 Jan.	995.09	76.56	47.17	149.10	0.00

In order to improve the working relationships between Detachments and Army and to inform Detachments and Staffs of the current supply situation, a supply informational letter was issued. In addition, the instructional guide for G-5 JANUARY was amended to conform with the most recent directives.

The change in the Army boundary brought within Army jurisdiction for the first time the Duchy of LUXEMBOURG and the Province of LUXEMBOURG, BELGIUM. Both of these areas brought new problems of supply and supply operations. LUXEMBOURG's supply situation had been severely aggravated by the German counter-offensive which resulted in the temporary loss of the best food producing area of the Duchy. Substantial relief was shipped into the Duchy from imported food stocks with the help of recent shipments made to Army by Communications Zone. In order to meet the Duchy's needs more efficiently, supply requisitioning and accounting for it entirely were centralized in Civil Affairs Detachment G1/G5 at LUXEMBOURG CITY (P-81). In BELGIUM, Civil Affairs stocks supplemented civilian food relief brought forward by the Office of Belgian Relief.

The Army's operations in GERMANY necessitated issues to enemy nationals for the first time. Both food and POL were issued, the latter to raise possible production such as threshing and milling which would decrease the need for future imports of food.

Upon the inclusion of new areas in the Army Zone, monthly POL allocations were received for them as had previously been arranged for FRANCE, so that drawings for civilian use could be made from Army supply points. At the end of the month, however, a change in POL distribution seemed to be imminent as plans were underway for supplying by Communications Zone. Apportionment and distribution for local civilian uses would then be made through existing governmental machinery. The supply of POL to LUXEMBOURG, however, was to continue as at present through Army channels.

The problem of the supply of coal became critical in both the Provinces of LUXEMBOURG, BELGIUM, and the Duchy of LUXEMBOURG as stocks available for industrial, transport and public utility uses for extremely low. Recommended efforts of the Civil Affairs Detachment of LUXEMBOURG until the end of the month resulted in arrangements with the [illegible] Fuels subsection of Supply Headquarters for the immediate shipment of 1,[illegible] tons for use in the Duchy. The Civil Affairs Detachment at ARLON (P-42), BELGIUM, made similar arrangements with Belgian authorities for substantial quantities to be brought into LUXEMBOURG Province.

Clearance with the Army Supply Services made available for Civil Affairs use over 1,[illegible] gallons of [illegible] gasoline and approximately 8,[illegible] tires and tubes for the rehabilitation of civilian transport. As a significant contribution to the economy of the Army was made by the Civil Affairs Section of the 30th Infantry Division in securing white snow clothes for the troops.

During the month, the American Red Cross Unit attached to the Army G-5 Section received from its own sources ninety tons of clothing for distribution to needy civilians in the Army zone. Necessary facilities were provided by the Civil Affairs Supply Depot at HAYANGE [illegible] for the receipt, storage and shipment of the stocks as distributed [illegible]

The XX Corps Zone was faced with a critical situation as the month drew to a close. Inability of the civil authorities to effect adequate plans for the processing and distribution of food had created a serious need in several localities. Efforts of the XX Corps G-5 Staff and a French Liaison officer from Army G-5 Section, in addition to the shipment of forty tons of flour from the Civil Affairs Supply Depot stocks, relieved the crisis.

TRANSPORTATION

Civil Affairs Transport Pool No. 1, which had been operating in connection with Civil Affairs Supply Warehouse No. 1 at ST NICOLAS de PORT (U-9504) was discontinued early in the month. The trucks of the 112th French Provisional Truck Company were brought to HAYANGE (U-7783) where the 101st French Provisional Truck Company was located and the two companies were thereafter operated out of a single pool. All parts of the Army Zone could be effectively serviced out of HAYANGE.

During January the Pool performed a total of 112 missions involving 772 separate trips. Over 800,000 pounds of relief supplies were carried, and hauling for Detachments, transport of indigenous supplies, carrying of fuel, food and other necessities for needy communities brought the total amount of cargo hauled to 2,465,000 pounds.

Displaced persons transported totalled 9,088, refugees 6,760. However, in the majority of cases the same individuals were carried two or three times, being hauled from collection points to displaced persons centers and from centers to evacuation points. In addition, Transport Pool trucks evacuated many civilians from areas threatened by the German counter-attack. An estimated total of 3,000 persons were thus carried.

When the Army was shifted northward, the Pool trucks gave major assistance to G-5 Rear, and to the many Detachments and the French Mission Militaire Liaison Administrative teams which moved to new headquarters. The entire equipment of the Displaced Persons Center at DOMBASLE (U-9804), including a large stock of food and clothing, was moved to the new location.

Several outstanding hauls were made by the Pool's French drivers. Twenty-five trucks rushed more than fifty tons of salt from DIEUZE (U-2524) to LUXEMBOURG CITY (P-81) to alleviate a serious deficiency. Ten trucks, during the height of the Battle of the ARDENNES, dashed through the narrow corridor into BASTOGNE (U-55) with twenty tons of food for destitute civilians.

More than 750 Polish displaced persons were transferred from FROIDVILLE (U-6693) to CHAUMONT (Z-0709) by a convoy of twenty trucks in a week of shuttling back and forth over icy roads without accident.

Bad roads, icy pavements, snow, freezing temperatures and enemy action took a heavy toll of all transportation. A large number of Civil Affairs Transport Pool trucks were immobilized for varying lengths of time but the total laid up for serious repairs never exceeded fifteen percent of total trucks. One truck struck an enemy mine and was destroyed. Two others were put out of commission by shrapnel while evacuating civilians under fire. One driver was wounded, one badly bruised.

An important feature late in the month was the re-equipping of the 101st Company with three-ton trucks. As one of the chief disadvantages of the Company's former one-ton trucks was their lack of capacity, the new and larger trucks increased the hauling efficiency of the Pool. The forty-eight one-ton trucks thus replaced were assigned to the Pool as a whole to be used as auxiliary transports.

Clearance and registration of fifteen captured enemy vehicles was obtained from the Army Ordnance Section. All of these vehicles were uncovered by Detachments and were released to them to augment their organic transportation.

The Second Section, Service Platoon had a very busy month because of low temperatures and icy roads which brought many Civil Affairs vehicles in for repairs. The Platoon handled eighty-four repair jobs. Damage to water systems by freezing, due to inability to obtain sufficient anti-freeze, contributed the major portion. The next heaviest demand was the straightening of fenders and axles and replacement of parts damaged through skidding accidents.

The Maintenance Patrol visited all Detachments, including the new ones serving in the territory of the VIII Corps. Vehicles were [illegible] and minor repairs [illegible]

Digitized by Google

Repairs were held up on all vehicles because of the difficulty in obtaining parts needed, but toward the end of the month badly needed radiators and motors were obtained for Transport Pool trucks. Arrangements were completed to obtain necessary parts for Civil Affairs/Military Government organic vehicles from European Civil Affairs Division Motor Pool.

Major efforts in rail transportation were devoted to arranging for and expediting coal trains into the Army Zone to relieve a bad shortage. More than 7,000 tons of coal were brought in by rail. Over 800 tons of salt were shipped out and 7,520 tons of food, fuel and miscellaneous necessities were brought into the NANCY (U-81) area before it passed out of Army control.

Arrangements were completed to permit three passenger trains to operate daily between PARIS (S-04) and NANCY (U-81). One of these was later withdrawn when the acute need of motive power caused the removal of all steam powered engines from passenger service.

Final repairs were made on the rail lines leading into METZ (U-85) and 600 people were returned to that city by rail.

Clearance was obtained for the shipment of surplus meat from VITRY (P-4110) to ARLON (P-62) and for the extension of service from METANGE (P-6507) to MOERSDORF (P-4928) for carrying food supplies and workers in steel mills working for the Army supply services.

Several trains were arranged to remove displaced persons from camps in the Army Zone to the Communications Zone. A total of 2,627 were transported on these special rail movements.

LABOR

Civil Affairs and Military Government Detachments played an important part in obtaining badly needed civilian labor for Army units. A large number of civilian interpreters and laborers were obtained in VIRTON (P-4110). A civilian construction crew was recruited to repair a damaged railroad bridge near IMF (G-1481). Fifty laborers were secured in MAYADEPOIX (P-4164) for employment by the VIII Corps. Detachment D2D2 organized crews of civilian laborers to clear and repair the military route through ARLON (P-62). More than 200 laborers were obtained to clean and rehabilitate the Caserne in BASTOGNE (P-55).

A large number of workers were put on duty in all parts of the Army Zone sanding bad hills, curves and icy stretches during the month.

Few of the steel mills and other factories in Army territory were working but employees were being paid by the companies in accordance with local laws and many were being employed in rehabilitation work.

SECTION VI

GOVERNMENTAL AFFAIRS

Conditions imposed by the German offensive were reflected in governmental administration throughout the Army Zone. Before the offensive began, a gradual resumption of normal functions had been observed, but the necessities of the military situation arrested this movement. Supply and transportation difficulties were increased by Army requirements; some schools were closed as troops requisitioned billets; local supplies were diminished by seizures of the enemy and necessary requisitions by the Army; and stricter security controls were imposed throughout the Army Zone. Fear of German success was evident in some areas. Against this background governmental authority in each country maintained high morale, encouraged the people, complied with Army controls, and took active measures to give assistance. At local levels, officials remained at their posts and provided auxiliary police for security measures. At higher levels, governmental authorities suspended civilian services where necessary, enforced and gave publicity to security measures. In the Duchy of LUXEMBOURG, additional assistance was given by the publication of Grand Ducal decrees authorizing representatives of the Government to requisition property and services, empowering Juges de Paix to try civilians violating security restrictions, and making the unlawful acquisition of Allied property a crime.

In FRANCE and LUXEMBOURG military classes were called up for training.

A notable improvement in relations between the Army and civil administration was observed, as the need for military restrictions which had appeared burdensome, was demonstrated.

LEGAL

Efforts were continued to reduce civilian participation in illegal traffic in property of the UNITED STATES. In FRANCE, the Military Tribunal appointed in NANCY (U-81) to hear these cases was advised of the action taken by Army Courts Martial in punishing soldier offenders, in order to emphasize the necessity of meting corresponding sentences to equally guilty civilians. Legal officers of this sub-section attended all trials and insisted on stern penalties for those brought before the Tribunal.

In order to assist the Army in preventing the loss of supplies through civilian channels, the LUXEMBOURG Government published a decree dated 14 December 1944 which stated: "All persons who shall destroy or dismure any mobile property destined or intended for the use of the LUXEMBOURG or Allied Army, or as rations for the civilian population, as well as those who shall steal, take, destroy, receive, buy, exchange, receive as stolen goods, or hide materials of war, or provisions belonging to the LUXEMBOURG or Allied Armies, will be punished by imprisonment of six months to three years or by a fine of 1,000.00 to 10,000.00 francs, or both." This enabled the enforcement agencies of the Army, and the LUXEMBOURG Government, to arrest civilians found dealing in property of the UNITED STATES.

The Government of LUXEMBOURG, at the request of the Army, published a decree, dated 8 January, empowering the Juges de Paix to try curfew, circulation and unauthorized entry into prohibited areas violations. Prompt trial of offenders resulted and penalties commensurate with the offense were given. As a result, such violations were held to a minimum and the state of law and order was the best encountered during the campaign.

Military Government courts in GERMANY tried and convicted twenty civilians charged with such offenses as violations of curfew restrictions, crossing the German-France border, circulation restrictions and violation of German laws involving the private slaughtering of cattle. Sentences given ranged from seven days imprisonment to six months at hard labor.

Due to sentences of confinement imposed by Military Government courts, it was necessary to establish a prison in the HEMMERSDORF (G-1959) area. The prison, established in an old German work camp, had facilities to accomodate eighty prisoners and was under the supervision of Military Government Detachment T2J2.

The chief of this sub-section attended a meeting at VERDUN (U-26) arranged by the Legal Section, G-5, Headquarters Twelfth U.S. Army Group. Legal officers of the Third, First and Ninth U.S. Army, G-5 Sections, and of the LUXEMBOURG Mission were present. Changes and proposed changes in Military Government legislation, review procedure, and problems arising in operations were considered.

FINANCIAL

Accounting reports for the previous month were received from fifty-one Detachments operating in FRANCE, LUXEMBOURG, BELGIUM and GERMANY. These reports were reviewed at this Headquarters and forwarded with appropriate remarks to the Accounting Section of the country concerned. Seven additional French Detachments turned in their franc balances to the Sub-Accountant, G-5 Section. The Sub-Accountant, after transferring 260,000 francs to the Currency Section for FRANCE, had on hand at the end of the month 223,780.95 francs and 193,350 German marks.

Field reports containing items of financial interest were forwarded to higher headquarters.

A form was prepared and sent to all Corps, Divisions and Military Government Detachments to simplify accounting reports when no receipts or disbursements occurred during the report period. With further insistence that Detachments exhaust all other means of procurement, notably local authorities and the Army services, a further decline took place in expenditure out of Civil Affairs and Military Government funds.

Purchasing and Contracting officers were appointed on some of the larger Military Government Detachments. As a number of cases the Purchasing and Contracting officer, G-5 Section, acted on procurements for Detachments.

No BELGIUM or LUXEMBOURG funds were drawn by the G-5 Section, and Detachments requiring such funds were referred to the Currency Section for BELGIUM, LUXEMBOURG Branch.

A further supply of Laws 51, 52 and 53 were printed for distribution to Military Government Detachments. Several cases arose during the month where fines from Military Government courts were improperly turned in to Army Finance Sections. A directive was prepared indicating the correct procedure for handling such receipts.

The Financial section of the Instructional Guide was revised to conform with latest directives from higher authority.

Toward the end of the month it was announced that the conversion of marks into francs would occur in the Department of MOSELLE, east of the MOSELLE River, during the week 29 January through 5 February. Arrangements were made by the French Government to pick up any Allied Military marks which had found their way into civilian hands. Exchange offices were established in as many towns as possible consistent with the exigencies of military operations. The need for exchange facilities in displaced persons centers was brought to the attention of the French Government.

As little German territory had been occupied by the end of the month, and as this area had been almost completely evacuated by the normal civilian population, reports on financial and property control matters by Military Government Detachments were largely negative.

One banker, the vice-president of the WAUGASSEN (P-3174) Volksbank, turned over the funds of his bank to the Detachment at DIFFERTEN (G-3171) for safekeeping as the bank was in danger of being destroyed by shell fire. The Detachment in turn deposited the money with the Finance officer of the 95th Infantry Division. Steps were taken to return the funds to the bank as soon as the tactical situation permitted.

In LUXEMBOURG the problem of French francs finding their way into civilian hands was no longer acute since ample exchange facilities were established for troops by Army, Corps and Division. No further opportunity was given to civilians to exchange French francs for LUXEMBOURG or BELGIUM currency since the prescribed period in the latter part of November 1944.

PUBLIC SAFETY

Military operations directed continuous attention and emphasis to the enforcement of security restrictions. Local authorities and police assisted Army personnel in the control of circulation and in the inspection of the adequacy of blackout measures. Compliance with restrictions was excellent. This cooperation was attributed to strict enforcement of restrictions by Army and civilian police personnel and to an increased appreciation of their necessity by the civilian population.

In the Grand Duchy of LUXEMBOURG, violators of circulation restrictions were delivered to the gendarmerie for trial before local courts. The Provost Marshal notified the sub-section of all arrests of civilians. The notices were sent to the nearest Detachment with the request to follow the progress and disposition of cases in the local court.

Ten thousand French, 10,000 Luxembourg and approximately 1,000 German laissez-passer forms were delivered to Corps, Divisions and Detachments.

Detachments were requested to survey and report as to the adequacy of passive air defense and fire fighting facilities in their areas.

The Public Safety officer attended a meeting called at PARIS (S-04) by Supreme Headquarters to discuss Public Safety problems in LUXEMBOURG. It was decided that local movement from LUXEMBOURG to adjacent countries would be controlled by regular laissez-passer procedure, but that movement into other countries for visits of extended duration would not be permitted except on visa of the representative of the country of destination. Agreement was reached for the supply of uniforms to the LUXEMBOURG gendarmerie as quickly as shipments could be made. Arrangements were made for the issuance of special passes to men reporting for duty in the LUXEMBOURG Army.

A request to renew bus service between ESCH (P-7301) and LUXEMBOURG CITY (P-81) received through Detachment C2I2, was recommended and sent to Provost Marshal and G-2 Sections for action.

Digitized by Google

At a meeting called by the [illegible] Section, G-1 Section, the [illegible] Corps and this subsection [illegible] Section in order to [illegible] sections thereto were discussed.

PUBLIC HEALTH

The Public Health items of importance during this period were the continued incidence of diphtheria and dysentery, especially in the former areas, and the arrangements for foot and mouth disease.

In the wake of the German counter-offensive in Northern [illegible] and LUXEMBOURG, there was an increase of diphtheria incidence. There were [illegible] cases reported to fifty-two for last week. The towns affected were [illegible], WILTZ (P-2944), CLERVAUX (P-2914), [illegible] (P-[illegible]), [illegible] (P-[illegible]), [illegible] (P-[illegible]

The friendly nationals (displaced persons) uncovered in such camps were the responsibility of G-5; plans had to be made in advance for their housing, feeding and eventual repatriation. With the information at hand, planning by all G-5 agencies was possible well in advance.

Similar information from many sources coordinated the plottings of the prisoner of war camps and the camps where foreign workers were held. The prisoner of war camps, expected quickly to be evacuated, were planned for use in handling masses of displaced persons; foreign workers' camps could expect a "stand fast" order until more normal conditions prevailed.

Further studies of population figures were made, revised and published in the light of current available information. Studies of specific cities to the forward of Third U.S. Army were made and issued to the Detachments affected, detailing as nearly as possible current conditions in the towns, the extent of the bomb damage, the industries still existing, the billeting facilities, the railheads, the laundries, the storage warehouses, refrigeration facilities, dump parks, etc.

Detachments in the forward zones (there were ten in GERMANY by 1 March) relayed back much information of value through daily and special reports and through word-of-mouth interviews with Intelligence Branch couriers who visited them daily. Division Civil Affairs/Military Government Staffs and Corps G-5's added to the fund, and the constant cooperation of G-2 and Counter-Intelligence Corps, Army, provided the rest.

The information was disseminated throughout the Army. As a result, the plan for the occupation of GERMANY beyond the RHINE was not the bare framework of two months previous; Detachments pin-pointed for the region beyond the RHINE had their work cut out for them and they knew what that work was.

The month saw, too, an innovation which apparently proved of worth. Through agreement with Publicity and Psychological Warfare, a stock issue of its paper DIE MITTEILUNGEN was printed in large quantities for use of Military Government Detachments entering German towns. The stock issue contained the proclamations of the Supreme Commander and the laws and ordinances which the people were expected to obey. In this way wide circulation of these all-important statements was had immediately. Other issues of the paper followed with straightaway news reports. The people, familiar with the official tenor of the first copy, knew that the forthcoming copies were American too and treated the news as gospel.

The Daily Summary and courier service of the Intelligence Branch aided materially in the saving of thousands of cattle in the Duchy of LUXEMBOURG. The AC of S, G-5, XII Corps was appealed to directly by LUXEMBOURG farm interests to help them rather fodder to save the starving cattle. The AC of S, G-5, XII Corps called upon his Detachments informally to go all out in the effort to round up suitable fodder and asked the Daily Summary and the couriers to spread the word. The campaign became almost a contest; more than 1,000,000 pounds of fodder was brought in. Detachment I542, JUNGLINSTER (P-9325), easily won the honors with 579,000 pounds. But thousands of cattle were tided over until the snow melted from the pastures.

COMMUNICATIONS

Intracity mail was authorized in LUXEMBOURG (P-81), ESCH (P-7301) and PETANGE (P-6407).

Two circuits between METZ (U-85) and NANCY (U-81) in the Postes, Telegraphes et Telephones long distance cable were released to the Societe Nationale Chemin de Fer. These were used to coordinate railroad operations.

Circuits for control of electric power were arranged from BRIEY (U-67) to PONTOY (U-7588) and SAULNES (P-6105).

UTILITIES

Land mines were cleared from the high tension electric power line between UCKANGE (U-8679) and CARLING (Q-2463). Repair of the 65,000 volt line was well under way at the end of the month.

Electricity was restored at MONDELANGE (U-7798), HOMECOURT (U-9879), ESCHANGE (U-9889), ECHANGE (U-9485), BUDING (U-9782), MONTDIDIER (U-9480), VOLSTROFF (U-9280), METZERVISSE (Q-6681), MONANGE (U-9179), PIENNES (P-9382), ETANG (Q-0080), KEMPLICH (Q-0282), FECKRING (Q-0182), DALSTEIN (Q-0979), BOUZONVILLE (Q-1377), GRESCHES (P-7537), WANY (U-6939), MERTZIG (P-4532), FREYLANGE (P-4632), LIRAMONT (P-3143) and all but two communes of ESCHANGE Canton, LUXEMBOURG.

Power supply to the southern half of the Duchy of LUXEMBOURG was greatly improved through renewal of operation of the SAULNES (P-6105) power plant.

Relay systems which had been damaged were repaired at WILTZ (P-75), STRUTZ (U-[illegible]) and MONDELANGE (U-7798).

SECTION IV

PLANS AND OPERATIONS

As the front lines of VIII and XII Corps moved into GERMANY, the following Military Government Detachments were attached to this Headquarters and placed in readiness to go into their pinpointed towns:

I862 PRUM (L-0679)	I1902 MAYEN (L-6393)
I1902 AHRWEILER (P-5516)	I1862 ZELL-MOSEL (L-6058)

Four Detachments and Headquarters, Company A, 2d European Civil Affairs Regiment were in turn transferred to the Sixth Army Group since their pinpointed locations lay in the projected zone of that Army Group.

Upon receipt of notice that eight Civil Affairs Detachments would return to European Civil Affairs Division on 17 February, an additional company of Detachments was requested. Company A, 3d European Civil Affairs Regiment was attached to this Headquarters and ten of the thirteen Detachments were immediately deployed, the remaining three being placed in the Army Reserve.

On the 22d of the month, Headquarters Company G, 2d European Civil Affairs Regiment was placed in the Zone of VIII Corps and arrangements were made for one company headquarters to service the Detachments in each Corps and to furnish courier service in addition.

On 28 February, Detachments were operating in the following towns:

GERMANY

ARZFELD (P-9566)	LEIDENSCHEID (P-9271)
BLEIALF (P-9783)	NEUERBURG (P-9758)
EFT (Q-0798)	WINDALTDORF (Q-1783)
GISINGEN (Q-2182)	CUTSCHEID (L-0156)
PERL (Q-0298)	

FRANCE

BOULAY (Q-0965)	LONEWY (P-5704)
BOUZONVILLE (Q-1377)	METZ (U-8757)
BRIEY (U-6973)	SIERCK (Q-0094)
HAYANGE (U-7783)	THIONVILLE (U-8687)

LUXEMBOURG

BETTENDORF (L-0022)	JUNGLINSTER (P-9325)
CLERVAUX (P-7663)	LUXEMBOURG CITY (P-8413)
DIEKIRCH (P-8742)	MERSCH (P-8208)
ECHTERNACH (L-0535)	REMICH (Q-0106)
ESCH (P-7301)	MONDELANGE (U-7697)
ETTELBRUCK (P-8260)	TROIS VIERGES (P-7571)
FELS (P-9132)	VIANDEN (P-9049)
GREVENMACHER (L-0721)	WALFERDANGE (P-8418)
HEISDORF (P-8420)	WILTZ (P-7053)

BELGIUM

ARLON (P-6222)	NEUFCHATEAU (P-3541)
BASTOGNE (P-5558)	ST HUBERT (P-3061)
MARTELANGE (P-5639)	VIRTON (P-4110)

REFUGEES AND DISPLACED PERSONS

The month was spent largely in preparation for a possible influx of displaced persons and refugees which would come with a military advance. Late in the month as the Army began a steady rush forward, the number of displaced persons and refugees needing care and control showed a sharp rise.

The previously agreed upon plan was put into effect under which in each Corps Zone a Collecting Team operated in Division areas, a Transit Point operating team to the rear, and in the Army Service area a team for operation of all camps in that area. This involved movement of personnel, both United States and attached, to their assigned stations. The number of Corps in the Army Zone was reduced during the month from four to three, necessitating some realignment in team operation.

Four new camps were set up and began operation. One camp was closed. Two additional camps were being made ready at the close of the month. A determined effort was made to locate and reserve new camp sites and this resulted in the reservation of two sites with a third in process.

The numbers of displaced persons in Transit Points and the numbers evacuated during February were as follows:

	Displaced Persons in Transit Points	Evacuated
7 February	1,068	530
14 February	927	52
21 February	354	508
28 February	593	275

The following Transit Points were available or in operation during the month:

Location		Capacity
BOULAY (Q-0965)		100
DONDING (Q-1267)		1,500
METZ (U-8757)		500
LUNEVILLE (U-7391)		800
MARSPICH (U-7783)		500
VAL-de-POIX (P-2560)		500
CUTLICH (P-8426)		500
CHATEAU RENAUD (P-6520)		200
HOLLERFELD (P-7925)		350
ST HUBERT (P-8413)		400
PERL (Q-0298)		350
ANDERNACH (P-7824)	Reserved	-
ARNEVILLE (U-8474)	Reserved	-

The total number of refugees and displaced persons reported as of 28 February was as follows:

	Refugees	Displaced Persons
FRANCE	14,061	872
GERMANY	11,534	407
LUXEMBOURG	29,913	476
BELGIUM	7,564	76
TOTAL	63,072	1,831

SECTION V

RELIEF AND SUPPLY

The supply of the Duchy of LUXEMBOURG was a major activity during the month. Whereas both FRANCE and BELGIUM were already beginning to put into operation their own machinery for the distribution of civilian supplies through normal civilian channels, LUXEMBOURG was still largely dependent upon the military for imports. This situation was the result of the fact that FRANCE and BELGIUM were able to resume normal importing through their ports while LUXEMBOURG's flow of supplies demanded upon overland transportation still largely under military control.

In order to simplify the handling of LUXEMBOURG's supplies, efforts were made to arrange for shipments from Communications Zone to come directly to the Duchy's receiving points. This involved making a distinction between the Duchy's requirements and those of the rest of the Army Zone. Such a procedure would speed shipments to the Duchy, remove a burden of receiving, culling and redistributing from the Civil Affairs Supply Depot and lay the groundwork for a smooth flow of supplies from the rear to the Duchy that might continue without interruption when this area had passed out of Third U.S. Army control.

The procedure for handling of Civil Affairs supplies for FRANCE and BELGIUM was placed on a new basis when the national authorities of those countries were made completely responsible for the receipt and distribution of all Civil Affairs supplies, including those required for the use of refugees and displaced persons. These supplies were to be turned over to the civil authorities at portside, thus relieving this Army of any part of their handling.

Digitized by Google

DECLASSIFIED

The prospect of early operations in GERMANY and increased estimates of the numbers of displaced persons likely to be encountered there resulted in the decision to increase the reserve of foodstuffs at the Civil Affairs Supply Depot stockpiled for such emergency. The goal was now a reserve stock of 2,000 tons of Class I supplies. To this end, requisitions already submitted to Communications Zone were being revised at the close of the month.

In the meantime, those Detachments operating on German soil were meeting all their needs for feeding the German population out of local resources and captured stocks. Only soap and sanitary supplies were provided out of imported stocks to help prevent disease.

During the month, the American Red Cross representative at Army received a total of 100 tons of clothing for distribution to needy civilians. Of this, eighty-five tons had been put into distribution channels at the end of March. Accordingly, requests for clothing out of Civil Affairs stocks were held to a very low level.

Detachments in the field continued to play a vital part in the flow of essential supplies into their areas. The transportation of 550 tons of coal by rail into METZ (U-85) for civilian use and the movement of 1,000,000 pounds of fodder from forward areas to feed evacuated cattle were two outstanding examples of such activity.

The administrative structure and personnel of the Civil Affairs Supply Depot was modified by the detailing of a Military Government Detachment to operate at the warehouse under the supervision of the Commanding Officer. One officer of this Detachment was ordered to work with the Second Section, Service Platoon which was given complete responsibility for the dispatch of trucks from the Civil Affairs Transport Pool in addition to its previous duties.

The following tabulation shows the movement of supplies at the Civil Affairs Supply Depot during the month:

(All figures in net long tons)

	Food	Clothing	Blankets	Soap & Sanitary Supplies	POL
On hand 1 Feb.	995.09	76.56	46.20	149.10	.00
Rec'd during Feb.	2,262.40	22.81	.00	101.90	191.90
Issued during Feb.	1,829.20	11.00	7.00	123.35	191.90
On hand 28 Feb.	1,428.29	88.37	39.20	127.65	.00

Of the above quantities 1,275 tons of food and ninety-two tons of soap were supplied to the Duchy of LUXEMBOURG. Medical supplies going to the Duchy of LUXEMBOURG consisted of thirty-six vials of tetanus anti-toxin, sixty vials of triple typhoid vaccine, 2,500,000 units of diphtheria anti-toxin and one forty-bed hospital unit.

TRANSPORTATION

The Civil Affairs Transport Pool was again increased in size during the month by the addition of another fifty three-ton trucks brought in from Communications Zone. These trucks were acquired without additional personnel. However, the disposition of a large number of one-ton trucks promised to make sufficient personnel available.

In an effort to alleviate the shortage of civilian transportation in the Duchy of LUXEMBOURG, it was decided to turn over permanently to those authorities a total of thirty-five of the Civil Affairs Transport Pool one-ton trucks and trailers. Before the transfer was consummated, however, all of these trucks were inspected and repaired to put them in the best possible condition. At the end of the period fourteen trucks had been transferred in this transaction. The entire deal was accounted for on a quantitative receipt basis.

Another reduction in the number of one-ton trucks retained at the Civil Affairs Transport Pool was the result of a decision to establish sub-pools of ten trucks with each of the Corps. This was expected to effect substantial savings in time and fuel by keeping a number of trucks close to the usual area of their operations. With the same economy in mind, eleven were assigned on the basis of one per Mission Militaire Liaison Administrative team.

A thorough inspection of the one-ton trucks revealed that at least ten of them were in such poor condition as to make it advisable to cannibalize them and salvage their usable parts for the repair of the others. During the repair period, the three-ton trucks bore the brunt of the operations insofar as dispatches emanating from the Civil Affairs Transport Pool were concerned. It also corrected the excess of trucks over driving personnel which had resulted from the receipt of 100 trucks without drivers during the previous two months. The one-ton trucks transferred to the Duchy of LUXEMBOURG, and those sent to the Mission Militaire Liaison Administrative teams were [illegible]

Trucks assigned to Corps were assigned drivers on the basis of one per vehicle, plus one officer per Corps. The vehicles assigned to Corps and Detachments with Mission Militaire Administrative teams were issued on memorandum receipts as opposed to the permanent transfer of vehicles made to the LUXEMBOURG Government.

The administration of the Civil Affairs Transport Pool also was modified. One of the officers of the Detachment newly assigned to the Civil Affairs Supply Depot was detailed to assist in the administration of the Transport Pool. Furthermore, the truck dispatching responsibility was removed from the Supply Depot and made part of the activities of the Service Platoon so as to have it organically a part of the Transport Pool operation.

The month's operations of the Civil Affairs Transport Pool included making a total of 782 truck dispatches, hauling a total of 900 tons of supplies, 3,259 displaced persons and 2,160 refugees. In their maintenance functions the Service Platoon performed a total of 217 separate jobs.

The re-establishment and expansion of rail and bus transportation throughout the Army Zone continued with the assistance of this subsection and that of the Detachments in the field. Detachments arranged for many large rail movements among which were a cattle movement from ETAIN (U-47) to LOMMEY (P-4704), and a 500 ton coal movement from MERLEBACH (O-3361) to THIONVILLE (U-88). The tracks from ETTELBRUCK (P-83) to DIEKIRCH (P-84) were cleared for Army operations.

The rehabilitation of bus service was advanced with the authorization for a line from BETTEMBOURG (P-7934) to LUXEMBOURG CITY (P-81) and the opening of a few lines from VIRTON (P-41) to its environs.

SECTION VI

GOVERNMENTAL AFFAIRS

The reliberation of sections of LUXEMBOURG and BELGIUM, which were run over by the German offensive, necessitated the reestablishment of local government. Officials resumed their posts quickly and measures in support of military operations were taken.

In LUXEMBOURG, local forces in the forward areas were augmented by officials of the government who had been given emergency powers of procurement and summary court jurisdiction. Maintenance and repairs of military roads were facilitated by the coordination of military and civilian repair units, and other necessary civilian labor was made available as required. Local police cooperated in security measures and in salvaging military equipment.

LEGAL

There were few material changes in the legal situation in LUXEMBOURG. The courts were functioning regularly and were gradually disposing of a backlog of cases.

Trials for offenses involving illegal traffic in supplies such as gasoline, clothing, rations, cigarettes and similar items decreased during this period, but there was an increase in violations of circulation and curfew restrictions. The latter were brought to the attention of the LUXEMBOURG Government which cooperated by severely punishing offenders in the courts.

There was placed in operation on suggestion of Civil Affairs a procedure whereby a Juge de Paix Circuit operated, providing a means by which the presence of a Juge de Paix could be requested for trials in outlying communities.

The occupation of more populated places in GERMANY brought many more enemy civilians under the jurisdiction of Military Government Courts. Divisions and Corps appointed Military Government Courts for the trial of offenses against the laws of Military Government.

Eight courts were appointed during the period for the trial of offenders. A total of thirty cases were tried resulting in punishments ranging from small fines to five years imprisonment for such offenses as violation of travel restrictions, larceny of property of American forces, failure to report presence of German soldiers and transportation of mail over the frontier.

There were eight [illegible] Courts. [illegible] view of cases tried by [illegible]

FINANCIAL

January cash accounting reports of forty-one Civil Affairs and Military Government Detachments were received and forwarded to appropriate country accounting sections. Receipts and expenditures were negligible as most Detachments were able to meet their needs through regular Army channels or by making demands on local authorities in accordance with arrived upon procedures. Two additional Detachments turned in French franc balances to the Sub-Accountant, G-5 Section, who ended the month with balances of 355,364.55 francs (French) and 186,700 marks (German).

The conversion of marks into francs in the Department of MOSELLE (FRANCE) was completed during the month. Final totals were not available because banks in outlying districts were hampered by lack of communications and transportation. Up to 15 February, one billion francs had been exchanged. Regardless of the amount of marks turned in to exchange offices, individuals received only 500 marks worth of francs (one mark equalling fifteen francs) with some concession being made for dependents. The remaining marks were kept in deposit accounts for exchange at a later date, permitting an investigation as to whether the marks were obtained legally or through black market channels. Financial officials expressed the opinion that some persons were withholding marks in their possession, but that on the whole the exchange had been satisfactory with the majority of people cooperating with the government program.

A copy of Verzeichnis fur die Finansamter des deutschen Reiches, 1 January 1942, corrected through August 1944, was located in the city of LUXEMBOURG (P-81) and forwarded to Twelfth Army Group which had requested such a copy as soon as located. A report on black market activities in the city of METZ (U-85) along with miscellaneous Detachment field reports concerning fiscal matters was likewise passed on to higher authority.

No serious financial problems developed in liberated countries where the national governments involved capably handled the reopening of institutions in cities reoccupied by the Germans in the December-January counter-attack.

In the Cantons of LUXEMBOURG and CAPELLEN all commercial banks showed a steady increase in deposits over withdrawals.

As of 20 February 1945, LUXEMBOURG CITY (P-81) had on hand and on deposit 13,637,226 francs to meet current obligations. Monthly estimated expenditures for wages, pensions and relief amounted to 2,200,000 francs. Taxes and other revenues were still slow in being collected, but in general the financial position of the city improved.

Property control serial numbers were assigned to fifteen Military Government officers responsible for property control functions. At the end of the month no reports had been received of properties taken into control.

Information on three properties belonging to nationals of LUXEMBOURG located in the area northwest of TRIER (L-22) was forwarded to Twelfth Army Group.

Though a number of additional Military Government Detachments became operational in German territory toward the close of the month, indications were that areas occupied were almost completely evacuated and no reports were received of financial activities of any sort.

A requisition for laws, orders, forms and letters of instruction was submitted during the month to Twelfth Army Group covering ninety-day requirements of Detachments under control of this Headquarters.

PUBLIC SAFETY

The thorough enforcement of security restrictions and effective publicity of their provisions resulted in uniform observance throughout the area. There was some difficulty in stemming the flow of refugees attempting to return to their homes in the northern section, however, the new circuit system of Juges de Paix was expected to improve the situation as violators were to be given a speedy trial.

During February local police [illegible]

Digitized by Google

A civilian bomb disposal squad formed at LUXEMBOURG CITY (P-81) was made available for use throughout the area. A similar group comprising sixty Belgian engineers was organized in the Province of LUXEMBOURG, BELGIUM, for the same purpose and did effective work; four of their number were killed and two injured during operations. More men were available for this group if additional equipment could be procured. This was being done on a priority basis.

Forty German rifles and ammunition were issued to Detachments for use of the Gendarmerie, these being used mostly in guarding prisons in the Grand Duchy of LUXEMBOURG.

An inspection was made of the prison in LUXEMBOURG CITY (P-81), and it was found to be overcrowded. On 9 February there were 791 male and 800 female inmates, of which number 1,312 were held as political prisoners. The screening of prisoners with dispatch would relieve recurrence of this situation.

PUBLIC HEALTH

Items of importance during this period were the continued increased incidence of diphtheria, the complete lack of civilian medical facilities in some sections of forward areas in enemy occupied territory, and the health problems inherent in the presence of large numbers of dead animals.

There was a continued increased incidence of diphtheria in the area of the VIII Corps Zone occupied formerly by the enemy. Belgian and Luxembourg Red Cross personnel were active in locating cases, administering anti-toxin and immunizing children. Twelve hundred children in the BASTOGNE (P-55) area, which included thirty towns, were immunized against diphtheria. One hundred twenty-three cases and four deaths occurred in the Third U.S. Army Zone, mostly in the VIII Corps Zone. Sufficient anti-toxin was available and was freely used by civilian physicians and Army Medical Corps officers in the control of the disease. Reports during the latter part of the month indicated that the incidence was declining and the situation under control.

In the same area, dysentery continued to be prevalent, but with diminished incidence. The epidemic reported in January in the refugee center at ARLON (P-62) abated abruptly following improvement of sanitary conditions.

A survey of the endemic area of foot and mouth disease was made in CLERVAUX Canton of LUXEMBOURG. Seventeen villages were visited and 248 or eleven percent of 2,270 cattle were found to be infected. The infected cattle were concentrated in five small villages. Burgermeisters were directed to restrict movement of cattle until they had been examined and found free from disease. Three civilian veterinarians were also assigned to this area to effect proper control of the disease.

In BETTEMBOURG (P-8103), LUXEMBOURG, forty animals out of one hundred were found to be infected with foot and mouth disease as a result of contamination with an infected truck brought down from the northern endemic area. The healthy animals were immunized with convalescent serum procured from ETTELBRUCK (P-84) with apparently good results. The infected animals were quarantined and the farm disinfected.

Following arrangements made between the LUXEMBOURG and SWITZERLAND Governments, 100 liters of foot and mouth vaccine were procured. About 2,000 animals were immunized in the vicinity of infected areas.

Typhus fever was again erroneously reported at WOLFSHALZE (P-6172) and SIEBENALLER (P-7758). Approximately 3,600 displaced persons and refugees and about 2,000 civilians were deloused with DDT powder.

Requisitions for medical supplies from displaced persons camps and from civilian institutions were adequately met. Basic Medical Units located in large governmental areas met most of the demands from civilian agencies. Detachments were notified of the availability of Basic Medical Units in BRUSSELS (J-65) for civilian health authorities in BELGIUM.

The greatest problems in liberated areas lay in Northern LUXEMBOURG and contiguous Belgian territory. The Belgian and Luxembourg Red Cross were actively engaged in these areas, utilizing teams made up of doctors, nurses and ambulances. Civil Affairs/Military Government officers were acutely aware of medical situations in their jurisdictions and facilitated the procurement of medical supplies and, in many instances, transportation for the doctors in the care of the civilian sick and wounded. Medical teams were located at ST VITH (P-9688), CLERVAUX (P-76) and WILTZ (P-75). Civilian doctors were stationed in towns where most needed.

In occupied territory in the VIII Corps Zone there was a complete civilian medical vacuum. There were no doctors, no hospitals and no medical supplies. All medical aid to German civilians was given unstintingly by Medical Corps officers. The only other medical attention was given by two or three nuns with nursing experience at AUW (L-0190) and a nurse at SCHWEILER (P-9584). Drug, dressing and instrument kits were located with Military Government officers for the use of these nurses. In the meantime, in order to relieve the burden of care of civilian sick and wounded from the Medical Corps officers, two German doctors were procured, one who had been wounded and found at ST VITH (P-88) and the other borrowed through First U.S. Army from AACHEN (K-84). These doctors, with the assistance of a Public Health officer from this Headquarters, were located in AUW (L-0190) and BLEIALF (P-9783), and a hospital was improvised. Arrangements were made also for the reception of German wounded nationals to be accepted in hospitals at AACHEN.

In occupied territory in the XX Corps Zone medical facilities had not been depleted as in the VIII Corps Zone. In fact, they were considered adequate for immediate needs. A hospital at SAARBRUTTEN (O-28), one at WALLERFANGEN (O-2681), a hospice at NIEDALTDORF (O-1783), and doctors scattered in this locality met the medical needs for the care of German sick and wounded.

In BELGIUM, hospital facilities were adequate, although considerably hard pressed. Auxiliary hospitals had been set up at ARLON (P-62), BERTRIX (P-2242), and LIBRAMONT (P-3149). All sick and wounded in BELGIUM north of LUXEMBOURG were transported to MARLOUY (P-70) where space in the hospital was made available by further evacuation of those present to the hospital at VERVIERS (K-6723). In LUXEMBOURG, hospitalization of wounded civilians was a difficult problem. Due to the influx of wounded civilians from occupied territory, hospitals in LUXEMBOURG were being continually over-crowded. Difficulties were also encountered due to the absence of civilian ambulances, the burden of this service being directly placed on the facilities of the Army.

The battle of the ARDENNES brought death to many cattle in the forward areas. Cattle that could not be evacuated were left to the mercy of artillery, wanton slaughter, mines, booby-traps and starvation. With the melting of the snow, the burial of dead animals became extremely important due to possible contamination of the water supplies. The problem presented a great many difficulties due to lack of civilian labor, difficulty in procuring bull-dozers because of urgent need elsewhere, congestion on the roads, muddy terrain, location of animals within enemy fire, and the advanced state of putrefaction of the animals. With the assistance of prisoners of war and trained burial crews, and the efforts of Civil Affairs/Military Government Detachments, considerable progress had been made in their burial. There were about 3,000 dead animals in the VIII Corps Zone and about 1,500 in the XII Corps Zone. It was estimated that about ninety percent of the animals were buried.

CHAPTER 10
MARCH OPERATIONS

SECTION I

GENERAL

Following close on the heels of the ever-advancing Third U.S. Army, Military Government Detachments crossed the RHINE en masse during the month. At the beginning of the month, but nine Detachments had reached GERMANY; at its end forty-five of the forty-seven Detachments assigned to Third U.S. Army were established in enemy territory, twenty-three of them in their pin-pointed positions. The whole picture had changed. Civil Affairs had become Military Government.

Devastated GERMANY, rocked by air raids, beaten by bombardment, civilians evacuated, without water, electricity, gas, was a far different problem than FRANCE or BELGIUM or LUXEMBOURG. The Military Government Detachment moving into the Rhineland found no government ready-made and waiting its arrival. It was hard to find anyone who knew anything about government. A number of the burgermeisters who remained behind were discovered, upon screening, to have been ardent Nazis. They were immediately removed. Military Government found its most cooperative officials by studying old civil lists dating back to 1927-1933. XII Corps, uncovering such lists, found old burgermeisters willing to serve who had been removed from office in 1933 by the Nazis. Close cooperation between Counter-Intelligence Corps and Military Government prevented the appointment of officials outwardly compliant but inwardly hostile.

Following its directives, Military Government looked first to those things in GERMANY which would be of help to the Army. Burgermeisters were instructed to clean up the streets and highways. Water, light, telephone and gas systems were repaired with German labor, as rapidly as possible.

Every German over twelve years of age was registered by Military Government Detachments and the names were checked against the black and white lists provided by Counter-Intelligence Corps.

German food fed thousands of displaced persons, French, Dutch, Belgian, Luxembourgers, Serbs, Russians, and Poles who had for four years done the German's work. Some 83,000 of them were in Military Government centers at the end of the month. 18,000 French prisoners of war and forced laborers had been returned to their homes through the repatriation center at LONGUYON (U-4596) FRANCE.

The first of these repatriation trips came on 12 March when fifteen Military Government trucks, decked with French and American flags, carried the first 750 French prisoners of war out of GERMANY and back to FRANCE. The prisoners themselves had written in chalk on the bodies of the trucks and on the windshields "Vive le Troisieme Armee!" "Vive le general Patton!" They were singing their own version of "The Star Spangled Banner" as they passed through LUXEMBOURG CITY (P-81). After four years of imprisonment, they were going home.

Plunging finally into the heart of GERMANY, G-5 left behind it the satisfaction of knowing that LUXEMBOURG, the friendly little Duchy where Third U.S. Army stayed nearly three months, was finally on the way to food sufficiency. By arrangement with Communications Zone authorities, food came direct from the ports to LUXEMBOURG CITY (P-81)--and in March there were 6,500 tons of it, enough to set the ration at a satisfactory level for the first time.

But GERMANY was a difficult problem. GERMANY had to be ruled. The people, always subservient to authority, had to be told what to do, when and how to do it. The posting of our laws and ordinances told them how Military Government was going to operate, and the summary courts set up by Military Government gave them a quick and decisive answer to the question, "How tough are the Americans?"

The first sentences handed down by the Military Government Summary Courts were sufficiently severe to convince the Germans that they were not dealing with the 1918 Americans. In KOBLENZ (L-99), for instance, where Germans had known the American in 1918, the citizens were certain that the Americans had not changed since the last occupation. They read the proclamations with a grain of salt. But they discovered, before very long, that the proclamations meant what they said.

The month marked the first outbreak of typhus in Third U.S. Army area. Thirty-four cases were reported in the zone of operations and quick action by G-5 medical men isolated the cases in civilian hospitals, dusted the "contacts" and posted the towns "off limits" to troops.

Vast quantities of food and supplies fell to the Military Government Detachments as they advanced into GERMANY. This was as it should be for directives call for the feeding of Germans with German food. No imported food was called forward for feeding Germans. Displaced persons were fed principally with German food, provided by the German authorities.

SECTION II

PERSONNEL AND ADMINISTRATION

Military Government staff sections were formed for the 65th and 69th Infantry Divisions, newly assigned to this command during the month. Authorization to secure enlisted personnel from within the divisions was received from Twelfth Army Group because of the acute shortage of trained personnel in European Civil Affairs Division.

Numerous publications were dispatched to all Military Government Detachments, including Instructional Guides covering all phases of Military Government operations in GERMANY.

An increased allotment of 647 officers for Military Government activities in conquered territory was received for the theater. Army Commanders were requested to assist in the furnishing of these officers. In view of the urgency for obtaining qualified Military Government personnel, all units under this command were requested to forward recommendations to this Headquarters for processing.

Digitized by Google

Three Military Government personnel appeared on casualty reports as wounded in action.

Four Purple Hearts, [illegible] Croix de Guerre Avec Palme, and [illegible] personnel of staffs and detachments.

DECLASSIFIED

SECTION III

INTELLIGENCE

The G-5 Intelligence Branch estimate of things to come proved accurate as the Army moved out of friendly LUXEMBOURG and into a docile but hostile GERMANY. Displaced persons appeared in the expected numbers. Camps to house them were readily discovered, having been mapped previously by the Intelligence Branch. The German people behaved as expected. They readily obeyed the proclamations and ordinances posted in their towns. Only among the younger, Nazi-indoctrinated youth, was there defiance of the Allied rule.

To guide Military Government teams who were thrown into GERMANY without previous operational experience, the Intelligence Branch began on 6 March the publication of Information Bulletins which were distributed to the Detachments. These bulletins contained the latest intelligence relating to Army's Zone and the area ahead of Army. They contained, too, instructions from G-5 Army on the handling of unusual situations which were forever developing. The initial reports of Detachments entering newly uncovered cities were also reported for the guidance of other Detachments.

As more and more of GERMANY was uncovered, the Intelligence Branch went into the newspaper business with a vengeance. Charged with the distribution of Psychological Warfare's weekly DIE NEUEN ZEITUNGEN, the Branch found, as of 31 March, it had attained a circulation of 100,000 copies in the Army Zone. Detachments, divisions and rear Headquarters found that the publication was highly popular with the people and increased their orders from week to week.

COMMUNICATIONS

A survey of the Reichspost telephone installations in the Third U.S. Army area west of the RHINE revealed that the following switchboards were intact: PFERDSCHEID (I-4317) 250 line dial board, four position, toll board, WADRIL (L-3408) 250 line dial board, three position, toll board, ST WENDEL (Q-5996), KYLL (I-7606), KIRCHHEIM-BOLANDEN (M-1919), ALZEY (M-2727), and BAD KREUZNACH (M-0938).

In TRIER (I-221), the local telephone equipment had been removed, but the toll switchboard located in a bunker, was intact.

The normal telephone equipment in NEUNKIRCHEN (Q-5982) had been bombed, but an emergency 200 line switchboard in the basement of the Finance Building suffered only about ten percent damage.

The local dial apparatus at KOBLENZ (I-99) was severely damaged, but the toll board located in the basement of the building was unharmed.

PUBLIC WORKS

A high tension power line with 10,000 kilowatt capacity was completed from FAILLY (V-9764) to AMANVILLERS (U-7465) FRANCE. This was used to supply electric power to METZ (U-85) and to furnish additional power to the industrial section of FRANCE near the LUXEMBOURG border.

Restoration of electric power to FALCK (Q-1970) FRANCE made possible the continuous operation of the water supply system.

A hydro-electric plant in excellent condition was found in SAARBURG (L-1413) GERMANY. With minor repairs, the equipment was capable of supplying power for the entire city.

With the aid of a civilian bomb disposal unit, mines were removed from an area at REMICH (L-0106) LUXEMBOURG, thus enabling repairs of the power line to be made.

A 2,000 kilowatt thermal station at TRIER (I-2[illegible] gether with cables necessary to operate the water s[illegible] power for two army hospitals.

DECLASSIFIED

Electricity was supplied to hospitals and military installations in ANDERNACH (F-7606) on a part time basis from a 350 kilowatt thermal generator located in a manufacturing plant.

A hydro-electric plant in RASCHEIDER MUHLE (L-7699) GERMANY in good condition supplied power to that town, together with PLAIDT (L-7599), KAPPEL (L-7896), MEISENHEIM (F-7900), KRUFT (L-7298) and OBER-MENNIG (L-6798).

A 10,000 volt power line from MITTELSCHEIDEN (M-0833) to BAD KREUZNACH (M-0938) was repaired. This supplied one-third of the latter city with electricity.

SECTION IV

PLANS AND OPERATIONS

The month of March marked the changeover from Civil Affairs to Military Government. Military Government Detachments were inspected and found to be in readiness for Military Government duties in GERMANY. Likewise, Civil Affairs Detachments engaged in displaced persons work, too busy to return to European Civil Affairs Division for orientation and refitting for Military Government, were refitted and redesignated in the field without interruption to their duties.

The beginning of the month found only two Military Government Detachments in their pinpointed destinations in GERMANY, but by the end of the month, the number had increased to twenty-three. The situation was moving so rapidly that plans were made to procure personnel and equipment from Army troops to form emergency Military Government Detachments in the event of enemy collapse.

Four provisional Detachments of two officers and three enlisted men were activated from personnel of Detachment E102. These Detachments were attached to Military Government Detachments I7G2 and I8G2 for the purpose of speeding registration of civilians in the area.

To simplify the administration and command channels employed in the control of Military Government Detachments, Company C, 24 European Civil Affairs Regiment, was designated as the administrative agency with the Army and all Military Government units in the Army were attached to the company for administration.

On the 27th of the month, the 556th Field Artillery Battalion was attached to the Provost Marshal Section to enforce Military Government and guard Military Government installations in the Army Service Area. Headquarters and Service Batteries were stationed in TRIER (I-22), Battery A at ANDACH (Q-4990), Battery B at RATHSCHEIDER (I-7113) and Battery C at WITTLICH (I-7954).

At the end of the month, Civil Affairs/Military Government Detachments were deployed in the following towns:

ALZEY (M-2727)	MOTSCH (I-1552)
ARLON (T-6222)	MUNSTERMAIFELD (I-7483)
BAD KREUZNACH (M-0938)	OBERBETTIN (I-7123)
BAUMHOLDER (I-7113)	OBERWESEL (I-9967)
BERNKASTEL (I-5246)	OFFENBACH (M-7368)
BITBURG (I-1353)	OTTWEILER (M-4439)
BOPPARD (I-8981)	PRUMZURLAYEN (I-9557)
BRAUNBACH (I-9466)	RONSDORF (M-7340)
CHOCHEM (I-5972)	SAARBURG (I-1413)
DRUMMERSHEIM (M-1647)	SAARBRUCKEN (Q-4570)
ECH (I-7301)	SAARLOUIS (Q-2879)
GEROLSTEIN (I-2381)	SIMMERN (I-1424)
GOMMERSHEIM (M-3356)	STEINHEIM (M-8468)
GROSS GERAU (M-5447)	STROMBERG (M-0349)
HAYANGE (U-7053)	ST GOAR (I-9873)
HOMBURG (I-9096)	ST WENDEL (Q-5996)
IDAR (I-7605)	THANNWEILER (I-4689)
LANGENFELD (I-8872)	TRIER (I-4975)
LINZ (M-4990)	TRIER (I-2129)
MAYENCE (I-4704)	UNKENHEIM (M-3539)
MERZIG (Q-2094)	WADRILL (M-6026)
METZ (U-85)	WERNERSHOF (M-2114)
MONTABAUR (I-8414)	WIESBADEN (M-3564)
MORBACH (M-3965)	WINNINGEN (L-8591)

SECTION V

REFUGEES AND DISPLACED PERSONS

Rapid military advance into GERMANY made during the month uncovered large numbers of displaced persons--principally Russians, Poles, and French. At the close of the period, approximately 53,000 displaced persons were in collection and transit points in Army Zone. The care and control of this large number of displaced persons placed a severe strain on existing personnel and transportation facilities.

During the latter half of March, eleven trainloads of French Displaced Persons were shipped from TRIER (I-22) to a French processing center at LONGUYON (T-4596) FRANCE. Each trainload carried about 1,000 individuals.

An important change which occurred was the stoppage of all movements of Eastern European Displaced Persons from GERMANY into the interior of FRANCE. Western European Displaced Persons continued to be moved to FRANCE and other Allied liberated countries.

At the end of the month, the following Transit Points were in operation:

	Displaced Persons In Transit Points
KASTELLAUN (L-7964)	144
TRIER (I-2129)	7,200
WITTLICH (I-1353)	1,000
SAARBURG-KREN (L-4870)	6,500
MONTABAUR (M-7672)	1,200
WITTLICH (I-7954)	3,722
MUNICH (I-1552)	1,838
TRILEX (I-4940)	500
BAUMHOLDER (I-7113)	7,963
IDENAU (Q-4990)	5,686
ST WENDEL (Q-5996)	4,000
GR. GE[illegible]ERAU (M-5447)	1,700
NEUNKIRCHEN (I-9557)	100
GEROLSTEIN (I-2381)	327
KIRCHHEIM (I-7649)	1,667
NEUNKIRCHEN (Q-5982)	10,000
	53,147

SECTION V

RELIEF AND SUPPLY

In order to facilitate the flow of imported supplies into the Duchy of LUXEMBOURG, arrangements were completed for direct shipments of such supplies from Communications Zone into the Duchy. The quantities brought into LUXEMBOURG reached a new monthly high, totaling 6,360 tons of food and 75,000 gallons of POL. Through G-5 efforts, it was therefore possible to provide for the first time an adequate civilian food supply. In addition to these, approximately 1,000 rifles were secured for the Duchy Gendarmerie and substantial quantities of hides and tanning supplies and equipment and several hundred draft horses were exported from GERMANY into LUXEMBOURG.

Relief supplies for BELGIUM and FRANCE were handled almost entirely through their own civilian governmental agencies so that only very small quantities, made necessary by emergency situations, were issued those countries through Army Civil Affairs channels.

Issues, other than those for LUXEMBOURG, were almost entirely made to meet the needs of displaced persons in GERMANY. Military Government Detachments secured varying quantities of local foodstuff for the feeding of displaced persons, depending upon the local supply and minimum needs of the German civil population. Supplies locally were limited because of combat-destroyed crops and food stores, the flight of local administrators and a lack of labor and transportation.

Prime consideration was given to the problem of increasing agricultural production. Toward this end appropriate directives were sent to all Detachments and discussions were held with the food and supply officers of key Detachments and with the Corps Military Government officers. Representatives of the Allied Control Commission, Supreme Headquarters Allied Expeditionary Force and Twelfth Army Group came into the Army Zone to secure information concerning the food and agricultural situation and to make provision for seeds and supplies for the spring planting.

Planning beyond immediate needs was also begun in the industrial field. As plants and facilities were uncovered they were reported by Detachments and then to Army G-4 and/or higher echelons. Special attention was being given [illegible]

Digitized by Google

During the month, the goal of a 8,000 ton food reserve previously set by Twelfth Army Group for G-5, Third Army, was reached. The possibility of an early collapse in GERMANY, however, led to a further increase of estimated food requirements to 8,000 tons. Since negotiations were in progress with the Army Quartermaster for a consolidation of the Civil Affairs/Military Government depot with the Quartermaster depots, a decision was reached in conjunction with the Quartermaster to request Advance Section, Communications Zone, to take responsibility for this reserve.

The movement of the Armies out of the liberated countries led to an effort by the War Department to bring accounting for Civil Affairs supplies up to date, so that bills could be presented to the national governments concerned. Several directives and War Department representatives came to this headquarters in connection with this project.

The following tabulation is a summary of Civil Affairs/Military Government Supply Depot activity for the month, quantities in net long tons:

	Food	Clothing	Blankets	Soap and Sanitary Supplies	POL
On Hand 1 March	1428.99	88.37	39.2	187.65	.0
Rec'd During March	7405.22	.0	46.5	17.9	233.1
Issued During March	7150.72	19.1	26.4	6.55	233.1
On Hand 31 March	1685.22	69.27	59.3	139.0	.0

TRANSPORTATION

The Civil Affairs/Military Government Transportation Pool moved from MAYANCE (U-7983) FRANCE to TRIER (L-22) so as to be more strategically located for its operations. The arrival of the 103rd French Provisional Truck Company with its fifty three-ton trucks and a full complement of personnel increased the efficiency and usefulness of the Pool.

The plan for the dispersal of the three-quarter ton trucks to Corps sub-pools was cancelled. Centralized maintenance and dispatch of trucks from the Transport Pool remained in effect throughout the month. The transfer, however, of thirty-five of these vehicles to the LUXEMBOURG Government was completed after the necessary repair work on them was accomplished.

Military Government Detachments made progress on the task of rehabilitating civilian transport through the collection and overhauling of remaining civilian vehicles and by securing captured enemy vehicles not required for military uses. The repair of rail facilities was being handled by the Army services. The restoration of transport facilities in the liberated countries was further advanced by the resumption of street car and bus services in several localities.

The following figures summarize the Civil Affairs/Military Government Transport Pool activities for the month:

Number of Trucks Dispatched	533
Number of Separate Missions	170
Approximate Number of DP's Hauled	60,000
Approximate Tonnage of Supplies Hauled	1,000

LABOR

As of 28 March, 5,217 civilians in the Duchy of LUXEMBOURG, their services obtained through Civil Affairs in cooperation with local authorities, were directly employed by Third U.S. Army units. After screening by Civil Affairs and Counter-Intelligence Corps, several hundred of them will continue as employees of the Army during the conquest and occupation of GERMANY.

SECTION VI

GOVERNMENTAL AFFAIRS

Military Government Detachments moved quickly to attain the immediate objectives of Military Government, the establishment of law and order. Proclamations, laws, ordinances and notices were posted; curfew and travel restrictions were imposed and the surrender of arms required. Military Government Summary Courts established for the trial of civilian violations, gave quick and adequate punishment.

Reports received from corps, divisions and Detachments operating west of the RHINE, described a docile people, amenable to law and regulation. Exceptions were noted at KOBLENZ (L-99) and COCHEM (L-5972), where the people were described as "sullen and uncooperative" and Detachments moving east of the RHINE observed a similar attitude.

In the establishment of local German Government difficulty arose in finding eligible and competent officers. Many of those who had not fled were ineligible because of Nazi connections. In many of the Kreis (City and Land counties), non-Nazis who had been removed from office by the German Government in 1933 were reinstated. In some of the smaller communities within the Kreis (Gemeinde) non-Nazi officials were found, who had not been removed because of their long service to the community and a part of these were retained.

At the next higher level of government, the Regierungsbezirk, and at the higher level of Provinz, it was more difficult to secure proper officials, and only in the Regierungsbezirk TRIER was Military Government able to install officers. There Dr. Wilhelm Steinlen, native lawyer and non-Nazi, was made Regierungspresident, and a small staff selected.

At all levels where Chief Administrative Officers were appointed they were able to organize police and other essential services upon a limited scale. All appointments were on a temporary basis, and some appointees were dismissed after screening by Counter-Intelligence Corps.

With these beginnings, the organization of Military Government took shape. Order was effected, controlled food distribution was resumed, farming was encouraged, clearing, repair and rebuilding of homes and essential utilities initiated. Its value to military operations could be found in the fact that no incident of civilian opposition to or interference with the military was reported.

In FRANCE and LUXEMBOURG, contact between Civil Affairs and local government was reduced as active military operations passed to GERMANY. Enforcement of security measures against civilians continued but emphasis moved to the internal needs of the liberated nations. In FRANCE, local government was efficiently organized and the resurgence of political expression continued. In LUXEMBOURG, Brigadier H.R.H. Prince Felix returned, the Consultative Assembly met, and the people awaited the return of the Grand Duchess Charlotte.

LEGAL

Legal action in GERMANY began with the posting of proclamations, laws and notices which established Military Government, abolished Nazi laws and organizations, suspended courts, imposed security restrictions upon the German population, and imposed penalties for violations. The machinery for enforcement was provided by the appointment of courts composed of Military Government personnel. A Board of Review was appointed and charged with the review of all cases in which the punishment exceeded imprisonment for one year or a fine of one thousand dollars, and all other cases tried by courts appointed by the Army in which a petition for review was filed. One case was reviewed by the Board of Review.

Records of all cases were received by the Legal sub-section. Those in which review was required were submitted to the Board of Review. For the purpose of supervision of the courts, and as basis for advice to them, all other cases were administratively reviewed for procedural errors, and when necessary, corrective instructions were given to courts. All records were sent to Twelfth Army Group for filing.

In the study of case records received, a lack of uniformity of sentences was noted. For information and guidance, an extract of all cases tried in the Twelfth Army Group Zone was sent to Corps, Divisions and Detachments. In other cases, letters were written to courts pointing out the inadequacy of sentences in cases involving serious offenses, and the necessity of adjudging sentences commensurate with their gravity.

Eighty-eight case records were received by the Legal sub-section, eighty-seven being reported from Summary Military Courts and one from an Intermediate Military Court. The greater part of the offenses charged were violations of curfew and travel restrictions. Two cases charging illegal possession of arms and one case charging the harboring of a German soldier and the giving of false information were reported. Severe punishment was imposed in the three cases.

In FRANCE and LUXEMBOURG, local courts continued to try civilians charged with offenses against UNITED STATES Forces. Civil Affairs Detachments in the locality of the commission of the offense were required to report the action taken by local authorities.

FINANCIAL

Accounting reports were received from thirty Detachments covering operations during the month of February. These reports were reviewed and forwarded to the appropriate country section. Statements reflected little movement in Civil Affairs/Military Government funds.

In the current month all French francs in the hands of Detachments under control of this headquarters were turned in to the Sub-accountant, G-5 Section, who showed a balance at the end of the month of 512,948.50 French francs. Initial consignments of Allied Military marks were made to seventeen additional Detachments who were provided with necessary accounting forms and instructions. Sub-accountant, this headquarters had on hand 116,700 RM on the thirty-first of the month. Of forty-five Detachments operating in GERMANY on that date, only three Detachments were without Military Government funds. Preliminary reports as to the activities of Sub-accountants indicated relatively few expenditures, with receipts consisting mainly of fines collected in Military Government Courts and the taking into temporary custody of abandoned funds of post-offices, and local authority treasuries. A number of Detachments successfully turned over their civilian payrolls to German local authorities, whereas the majority were paying such payrolls through Army channels.

Under new directives requiring Army Finance to refer all cases of abandoned funds to this sub-section for a decision as to whether such funds were to be considered "captured enemy funds" or funds returnable to owners when located, five cases arose and appropriate decisions were rendered by indorsements to the basic reports of the Finance Disbursing Sections.

Because of the nature of tactical operations during the month two distinct patterns became evident as to the possibilities of rapid financial recuperation in the areas of occupied GERMANY under control of this headquarters. On one hand, areas where the fighting was bitter and the material damages great were found to be largely evacuated, with bank buildings destroyed, vaults looted, records scattered and little immediate hope existing for the reopening of financial institutions and services. On the other hand, areas by-passed by combat troops were in relatively good condition and in many instances awaited only the decision of Military Government for the resumption of local financial services.

By the month end insufficient time had elapsed to organize activities in this field on any other than a Kreis basis, although a number of pinpointed regional Detachments had begun to coordinate their areas of responsibility.

General comments discernible from Detachment reports indicated a sufficiency of cash in the occupied area for a period of at least sixty days. Five banks were reopened with or without restrictions on old accounts by the month end and the inflow of new deposits demonstrated that individuals had substantial amounts of cash on their persons. In general, it was found that Kreissparkasses were in the best position to reopen in the area and could be used for Military Government purposes to better advantage than the Reichsbank system where personnel was not available and cash and records had been removed in many cases.

Instructions and report forms were distributed by Detachments to financial institutions upon arrival in pinpointed areas, as well as to government financial officials. Such documents appeared to be clear and easy of interpretation and were well received. An insufficient volume of Allied Military marks had been placed in circulation by the month end to get a clear reaction as to their acceptance by the population, but indications were that they would go to a premium because of the average civilian's fear of inflation and lack of confidence in his government.

No evidences appeared as to the development or existence of a black market. What little price data came to light showed no change from previously existing official prices, though many transactions were being conducted on a barter basis.

Agreement was reached by this sub-section with G-3 Accommodations and with the permanent Town Majors attached to this headquarters, and a letter was sent to all Detachments outlining fully the duties of Acting Town Majors in connection with the acquisition of the use of real estate in GERMANY.

On the 19th of the month a conference was held at Army Group where the head of this sub-section had an opportunity to discuss and compare experiences and problems with financial specialists of the First, Ninth and Fifteenth U.S. Armies. Questions were raised for decision by higher authority among which were the inadequacy of the German wage scale for civilian employees of Army coming from liberated areas, and the problem of currency exchange for these same employees.

Digitized by Google

In the field of property control, the only activities reported were the taking into custody of Nazi party headquarters and the taking into protective custody for safekeeping purposes of abandoned funds later to be returned to owners.

PUBLIC SAFETY

The rapid advance of our troops into German territory made security measures of prime importance. All Corps furnished tactical troops to Military Government to be used as security guards. These troops proved invaluable in keeping main supply routes clear of displaced persons and refugees. Displaced persons found on roads were either taken to the nearest displaced persons collecting point or re-routed over secondary roads. Guards picked up Prisoners of War (French) in addition to displaced persons, and thousands of these soldiers were repatriated. In many instances arms have been picked up from civilians by the security guards who patrolled their assigned areas, posted proclamations and ordinances and interrogated suspicious individuals. At the same time local civilian police forces were organized to relieve tactical units of the burden of maintaining large numbers of fixed security guards to enforce Military Government regulations.

After conferences with the Provost Marshal, the Chief of Staff authorized the assignment of a battalion of Field Artillery to the Provost Marshal for the use of G-5 as a security guard to control the circulation of displaced persons, refugees and civilians.

In some instances, broadcasting teams of the Psychological Warfare Branch were used with good effect in transmitting information to the civilians concerning laws, ordinances, curfew and circulation.

Former officials who had spent considerable time in Nazi prisons were found to be a good source for obtaining information of value and recommending civilian police. The civil population was generally docile and readily obeyed the laws and ordinances of Military Government.

Arrangements were made whereby the Luxembourg Hospital authorities notified the Luxembourg Mission of the receipt of German civilian wounded and the Mission passed on the information to Counter-Intelligence Corps.

Numerous Military Government Detachments and various units entering GERMANY requested passes for allied civilians to accompany those units as interpreters, laborers, mechanics, etc. These employees were screened by Counter-Intelligence Corps for entry into GERMANY regardless of previous screenings. All passes were issued by the Public Safety Branch.

The closest liaison with Counter-Intelligence Corps resulted in the removal of several burgermeisters with Nazi backgrounds before they had had time to consolidate themselves and their party friends in office. Several ardent Nazi Officials have been arrested and turned over to Counter-Intelligence Corps for eventual imprisonment in concentration camps awaiting trial.

PUBLIC HEALTH

March marked the first appearance in the Army Zone of the dread typhus fever. Thirty-four cases were reported among civilians.

Prior to the occupation, there were six cases of typhus in WORMERSWEIL (L-4318) which had developed in February while this area was in enemy hands. All were Russians. During March, nineteen Russian foot workers contracted the disease in BAUMBACH (L-9428) and were placed in the hospital at MEISENHEIM (L-9525). Four were confirmed by laboratory tests. Four died. The 800 civilians in BAUMBACH (L-9425) were deloused with DDT powder and the towns of MEISENHEIM (L-9523) and BAUMBACH were placed off limits to troops.

Six cases in the hospital at FISCHBACH (Q-4878) also came from a Russian workers camp. All contacts were deloused. Three of the cases were confirmed by laboratory examination. Two Poles, brothers, were found isolated in a house in ROCKENHAU (L-9638) and their cases were confirmed as typhus by the Army Medical Laboratory. One case was discovered as the sufferer was about to enter a Displaced Persons Camp at BAUMHOLDER (L-9713). He was isolated immediately in a local civilian hospital. Another confirmed case developed at GUTTENBERG (L-3926); three others were reported from FURSTENFELD (Q-5079) and laboratory-confirmed. A single case was confirmed at BEURON (L-4025), another at ST. [illegible] (Q-5696).

Diphtheria and dysentery continued prevalent during the period of the report. There was an increased incidence in the VIII Corps Zone. These diseases did not, however, present any danger of spread to the armed forces. Adequate quantities of diphtheria antitoxin were supplied to local doctors in an effort to control the disease.

With twenty-one Detachments reporting for an area involving a population of 613,989, the following communicable diseases among civilians were noted: diphtheria 172, scarlet fever 78, tuberculosis 98, typhoid fever 13, para-typhoid fever 3, dysentery 38, gonorrhea 110, syphilis 35, scabies 809, cerebrospinal meningitis 4, typhus fever 34.

During the early part of March, there were in many areas of the VIII and XII Corps Zones a total lack of hospital facilities. Severely sick and wounded civilians had to be evacuated to ARLON (P-6282) and LUXEMBOURG CITY (P-81) hospitals. As a partial solution in the reestablishment of medical facilities in occupied territory, improvised hospitals were set up in WEIDINGEN (L-0258), MEURSBURG (P-9756), BITBURG (L-1353), SCHWEICH (L-0975), WAXWEILER (L-0267), STADTKYLL (L-1495) and MOTSCH (L-1552).

Nuns, nurses and an occasional doctor were found to manage these hospitals. Drugs, dressings and instrument kits were provided by Military Government to meet basic needs.

After 15 March, however, with the more rapid movement of the Army, adequate hospital facilities were uncovered. A civilian hospital at TRIER (L-88) was requisitioned for civilian use. This was the only hospital for a time capable of coping with the large numbers of civilian wounded being picked up by the Army Medical Service. However, this hospital was deficient in beds and personnel, both of which were later procured elsewhere in the city and in neighboring towns. Subsequently civilian patients were evacuated from military medical establishments to the hospital at TRIER (L-88). An auxiliary hospital was established in BETTEMBOURG (P-7409) LUXEMBOURG.

To meet the demand for doctors to handle civilian cases, arrangements were made by VIII and XII Corps to procure German medical men from Prisoner of War channels after they had been cleared by CIC. Several doctors were procured in this manner and placed where most needed.

The thousands of displaced persons liberated by the advance of our troops presented grave problems in housing, sanitation and medical care. Sanitary Corps officers were deployed in the larger camps to assist in improving sanitary conditions. French medical officers and some doctors found among the displaced persons provided medical care. During the month, there were available to the section ten French medical officers, each attached to a team of the Mission Militaire Liaison Administrative. All displaced persons in occupied territory and those moved into liberated countries were deloused with DDT powder. Sick and wounded displaced persons were hospitalized in local Germany civilian hospitals or at improvised hospitals at the Displaced Persons Camps.

CHAPTER 11
APRIL OPERATIONS

SECTION I

GENERAL

April was the busiest month on the G-5 calendar since its activation as a General Staff section on 30 April 1944. On its first anniversary, G-5 took into camp its 1,000,000th displaced person. There were more than 250,000 in camps that day, 76,336 Western Europeans had been returned to their homes during the month, 12,049 of them during the two days 10 and 11 April, a record for the Armies. And during the month G-5 instituted a repatriation service that did much to redouble the enthusiasm with which the French had long regarded les Americains. Transport planes which had been flying westward empty were employed in carrying several thousand French prisoners of war straightaway to PARIS (9-04). 625 of them made the first trip from FRANKFURT (M-67) to PARIS on 11 April and, scattering widely to their homes, soon set all FRANCE to talking of the amazing Americans who liberated their men after nearly five years imprisonment and had them back in their homes with their families thirty-six hours later. From reports in the French newspapers, this practice, which was continued for liberated prisoners of war by G-1 when lift was available, did much to assuage French feelings, ruffled by YALTA and ALGIERS.

There was an urgent need to return Western Europeans to their homes as quickly as possible for still another reason. The capacity of the fifty-two camps in the Army Zone was limited to some 250,000 persons. It was not possible to repatriate any Eastern Europeans to their homes during April. No juncture had been effected at that time by the Third U.S. Army with the Russians, the Czechoslovakians or the Jugoslavians. Hence G-5 was forced to provide housing and food for the Eastern Europeans who comprised the bulk of the forced labor uncovered in GERMANY.

With supply lines stretched thin, hundreds of miles long, supplying these camps was another Third U.S. Army miracle. But the Quartermaster, who had undertaken G-5 supply along with his other heavy burdens, came through with some supplies. Local Detachments, scrounging on the countryside——by directive——turned up vast quantities of indigenous supply and supplies left behind by the Wehrmacht in its haste rearward. This combination allowed displaced persons Detachments throughout the Army Zone to feed their clients well while they awaited repatriation. German civilians got the minimum of 1,050 calories per day.

Security bulked large as a G-5 problem during the month and here too G-5 was forced to improvise. Troops for Military Government had long been talked of but never a reality. Faced with a teeming situation where the security of the Army was at stake, G-5 made a plea for the assignment of troops backed up by case and incident. Corps broke the ice. Heavy Field Artillery battalions no longer needed in the race across GERMANY were turned over to Corps G-5 for security guards. Antiaircraft troops were also used. On 6 April, the 558th Field Artillery battalion was attached to the Provost Marshal Section to enforce Military Government and to guard civil installations in the Army Zone. The entire 70th Infantry Division was deployed in the rear areas for security purposes and the 16th Armored Division performed the same function in NURNBERG (G-40), to be succeeded by the 4th Infantry Division. A disordered GERMANY needed guarding. Displaced persons frequently celebrated their liberation. The German populace watched its chance to break into Wehrmacht food stores when guards were withdrawn or moved.

Civil control, due to the closest liaison with Counter-Intelligence Corps, was adequate and burgermeisters who were found to have any connection with the Party were summarily removed. Sentences for crimes against the Army were sufficiently severe to deter repetition. Everywhere the German public was learning that this was not 1918-1919. 79% German civilians were tried with fines totalling over $6,000 and sentences totalling 3,142 days imprisonment. The Legal sub-section also had control of approximately 90,000 prisoners in concentration camps and prisons in the Army Zone.

G-5 was in on one of the most spectacular finds of the war——the uncovering of a vast cache of gold, believed to have been the bulk of the reserve of the Reichsbank. Found at the same time was a great collection of art loot, gathered by the Nazis from their victim-countries and "sold" to the Nazis on their own terms. These finds were handled by G-5, Army, until taken into charge by G-5, Supreme Headquarters Allied Expeditionary Force and the Currency Section of European Civil Affairs Division. These and other notable finds were uncovered by the Arts, Monuments and Archives officer of Supreme Headquarters Allied Expeditionary Force, attached to this Headquarters.

Tragic to the extreme but highly typical of Nazi "efficiency" was the now-notorious Death March of approximately 15,000 political prisoners and forced laborers who were removed from the FLOSSENBURG (P-3260) concentration camp and marched for three days and three nights by SS guards who shot or clubbed those who were too weak to follow. It was reported that approximately 3,000 were killed in this way before the 35 guards fled before the oncoming UNITED STATES forces. Fifteen tons of food were sent immediately in Military Government trucks, three emergency hospitals were set up by Military Government and the Army Surgeon and searchers sought out survivors of the march who had been able to escape the SS in the fields and woods.

Other horror stories came out during the month from the slave camps at BUCHENWALD (J-5270) where as many as 30,000 political prisoners and forced laborers were forced to work on meager rations until they died of starvation or beatings. In all camps uncovered where atrocities were discovered, Military Government commanders followed the example that was set at BUCHENWALD (J-5270)——the German people of the vicinity were "invited" to view the horrors perpetrated by the SS and Gestapo.

It was pointed out at Supreme Headquarters Allied Expeditionary Force that the sights of concentration camp horrors, uncovered by Military Government as the Nazis were near surrender, did much to quiet all talk of a "soft" peace. The press gave the camp full coverage and the stories they sent back to the States——and the [illegible]

SECTION II

PERSONNEL AND ADMINISTRATION

In the early part of the period Third U.S. Army advances carried well into territory which was later to become Russian occupied. This command never had sufficient Military Government personnel for deployment within its own zone of operations and, consequently, provisional Military Government and Displaced Persons Detachments had to be organized. Authority was received from higher headquarters and twenty-two Detachments were organized, for emergency deployment within this Army's zone, by drawing personnel from service units under this command.

A Military Government School was instituted for the training of personnel for the Provisional Detachments. Officers of this Staff lectured on their particular functions and a complete set of directives, instructional guides and other publications of a policy-forming nature were supplied to all Detachments. Upon completion of instruction, the Provisional Detachments were immediately deployed.

A change in Army boundaries in the middle of the period resulted in a shift of Divisions and Corps. Staffs of the 13th, 14th and 15th Armored Divisions, the 70th, 71st, 86th, 89th and 99th Infantry Divisions were briefed as to their Military Government mission under Third U.S. Army. III Corps, which had at one time been assigned to this Army, rejoined the command. Directives and other pertinent publications were furnished these newly assigned organizations. Several changes in personnel assignments were made.

Assigned officer strength at Army G-5 was increased to eighteen with the addition of specialist legal, transportation, relief and supply officers.

Numerous applications for assignment to Military Government activities were processed during the month. Many qualified applicants were placed on temporary duty with Military Government Detachments. A Board of Officers met at this Headquarters to interview enlisted applicants for commission as Second Lieutenants, AUS, for duty with Military Government, in an effort to assist in filling existing shortages in Military Government units. During the entire period of operations on the Continent, Detachments had been as much as fifty percent under strength.

Five Bronze Star Medals, two Oak Leaf Clusters to Bronze Star Medals and one Purple Heart Medal were awarded to personnel of Staffs and Detachments.

SECTION III

INTELLIGENCE

During a fast-moving situation that was unpredictable because of its complete shift of objectives during the month, the Intelligence and Information Branch was forced to cover, in its releases of information, all of the southern and part of the eastern provinces of GERMANY as well as portions of AUSTRIA and CZECHOSLOVAKIA. This required considerable improvising as little informative material was at hand from higher headquarters concerning Eastern GERMANY, AUSTRIA or CZECHOSLOVAKIA. The task was made more difficult because new Detachments which arrived had to be briefed on Third U.S. Army procedure in Military Government. Twelve temporary Detachments were instructed in the preparing of reports to this Headquarters, outfitted with Military Government manuals and instructional guides, and Intelligence officers of the Detachments were briefed on their particular mission. Six special Intelligence Bulletins were published, in addition to the regular Daily Summary, the Weekly Bulletin, semi-monthly report to Twelfth U.S. Army Group and the monthly "after action" report to Third U.S. Army. Some 3,000 reports were read, collated and distributed to the branches chiefly concerned during the month.

The shift in Corps during the month also necessitated the forwarding of intelligence material to those arriving Military Government Staffs. III Corps, however, required little education in Third U.S. Army Military Government procedure. Then first it arrived in Third U.S. Army Zone, its Military Government Staff had a thorough indoctrination by G-5, Army, late in 1944.

Security was a difficult problem. The Intelligence and Information Branch aided where it could by rushing Psychological Warfare Branch sound trucks to the scenes of disorder to aid in dispersing the crowds, and by guiding Detachments with policy tips and preventative precautions.

Public relations in GERMANY were far more difficult to handle than in friendly FRANCE. Each move was designed as to its effect on the people who were never to be allowed to feel that Military Government was softening up its treatment of a conquered people. After long consideration, for example, it was decided that the people of [illegible] could safely be allowed to hold their traditional Good Friday processional along outdoor stations of the cross from the town to a nearby chapel on a hill overlooking the RHINE. This ceremony had been banned for several years by the Nazi Government; its re-institution by Military Government, in the interests of religious freedom, had excellent results. Yet people in GROSS-ZIMMERN (M-2971), more hostile to the invading armies, were rewarded to have walked out of a Protestant church when the minister told the congregation they should be glad that the Nazis had been driven out and religious freedom restored. In such a town, gatherings of any size might easily become Nazi meetings; the Detachment was ordered to tighten up its restrictions against public gatherings.

Under the guidance of Military Government, [illegible] (M-67) formed a committee to alleviate suffering caused by discriminatory laws against Jews. New and complete ration cards were issued, an affidavit in hiring policies was pledged by the Chamber of Commerce and two Jews were appointed to the local Labor Board. [illegible] (M-67) was de-Nazifying rapidly.

Another move that made for inter-Allied good will was the hiring, after screening, of Allied personnel by Military Government. Military Government employed a score of Russian girls as waitresses in the officers' mess at Army Headquarters. And Detachments throughout the area followed suit, hiring Hollanders as interpreters, French as culinary employees and others.

To disseminate the news and the announcements of the Supreme Commander and local authorities, G-5 Intelligence and Information circulated at the month's close some 300,000 copies of the Psychological Warfare Branch's [illegible], a weekly paper. The papers, picked up at the press at [illegible] (M-67), were distributed to each of the Military Government Detachments who in turn handed them over to burgermeisters for distribution. The arrival of the [illegible] was eagerly awaited by the people; its coverage of the news was factual and, in the closing days of the war, the only true story of the collapse available to the Germans.

COMMUNICATIONS

All telephone and postal communications were suspended by Military Government immediately upon entering a city. All mail was impounded for later examination by AC of S, G-2. Reichspost personnel, under supervision of Military Government, were immediately set to work repairing open wire lines and telephone equipment for the ultimate use of the Army.

To enable Military Government Detachments to administer the areas under their jurisdiction, intracity telephone service for civilian activities essential to the attainment of military objectives was authorized in Third U.S. Army area from the RHINE east to MUNSTERN (M-9689). Courier service between communities was also authorized for activities essential to community welfare. Personnel of Civil Censorship Group were deployed in the area to insure security by monitoring telephone lines and spot checking courier material.

PUBLIC WORKS

Electric power for the area occupied by Third U.S. Army was produced in a few large generating stations and distributed over the complex German high tension power network. The generating stations had suffered little damage from either sabotage or battle action, but the power lines had been cut badly by bombs and artillery fire.

Two power specialists from the Regimental Reserve Detachment, European Civil Affairs Division, made complete reconnaissance of the main lines in low flying planes and spotted breaks in the lines and located broken towers. All efforts were then directed in the restoration of those lines that could be made operative in the shortest possible time. Military Government Detachments, using German personnel and equipment, quickly repaired the 110,000 volt lines connecting the 75,000 kilowatt generating station at BERLIN (M-0872) and the 10,000 kilowatt station at [illegible] (M-7761) with the two 4,500 kilowatt hydro-stations in [illegible]. Other German personnel under Military Government supervision repaired the local distributing systems.

Thirteen 2,000 kilowatt hydro-stations along the MAIN River near AUSCHAFFE (M-5936) were found intact and the large 75,000 kilowatt steam plant near NURNBERG (G-40) was undamaged but had only a limited supply of fuel.

As a result of these efforts, electric power was made available in the following localities:

ALSFELD (M-0840)	MEMMINGHAUSEN (M-3344)
BAD SCHWALBACH (M-2971)	MITTENWALD (M-3146)
Landkreis BIRKENFELD	NEUSTADT AN DER HAARDT (M-2942)
DARMSTADT (M-6662)	NURNBERG (G-4200)
FRANKFURT (M-6770)	OFFENBACH (M-7368)
GIESSEN BF (M-3797)	OTTWEILER (G-5889)
HANAU (M-8740)	Landkreis REICHSHOFEN
KASSEL (J-7152)	ST GOARSHAUSEN (L-9872)
Landkreis KOTZINGEN	SCHAC (M-3142)
KREUNACH (C-5688)	VISBECHACH (M-7666)
LAUTERBACH (M-1728)	WURZBURG (M-5936)
Landkreis MELSUNGEN	

Under saturation bombing, water mains had been shattered in all large cities and many smaller communities. German civilians were immediately put to work repairing the damage. With electric power available for pumping and the breaks mended, water was restored in the following localities:

ANSBACH (T-0622)	Landkreis MELSUNGEN
BLANKENBAIN (J-5557)	MUNSTER (G-4200)
FRANKFURT (M-6770)	OFFENBACH (M-7368)
HOCHSPEYER (J-1108)	OTTWEILER (G-5889)
ICHSTEIN (M-3880)	Landkreis REICHSHOFEN
KASSEL (J-7152)	ROTH (J-0415)
KREUNACH (C-5688)	WALLDURN (L-9199)
KUSEL (L-7605)	WIESBADEN (M-7666)
LIMBACH (M-5263)	

In some cases the pumping equipment was damaged beyond repair and improvisation was necessary. Fire engines, small gasoline and even hand-operated pumps were pressed into service to give the populace the needed minimum requirements.

SECTION IV

PLANS AND OPERATIONS

The Eastward drive, now deep into GERMANY, placed the Army in an area for which there were no pinpointed Detachments. To meet the existing shortage, Corps were authorized to form emergency Detachments from troops under their command. Assistance was given by providing directives, handbooks and materials for their training.

At Army level, emergency Detachments were also formed and a Military Government School was organized. Instruction in Military Government was given by officers from the various branches of this Section and at the end of the training, twelve provisional Military Government Detachments were activated and allotted to Corps for deployment.

Personnel from a Field Artillery and Anti-aircraft Battalion were also requisitioned for Military Government training, but a change in the Army's objective from directly East to South and South East, placed the Army again in an area for which there were pinpointed Detachments available and the request was withdrawn.

As the Army moved forward, Fifteenth U.S. Army was given the mission of controlling the rear area. By the 2nd of the month, eighteen Military Government Detachments west of the RHINE had come under its operational control.

By the end of the month the Army was entering AUSTRIA and a request was initiated to procure a battalion for activation and deployment as Military Government Detachments in this area until Military Government Detachments, pinpointed for AUSTRIA, could be made available.

ZWIESEL (Q-0161)

REFUGEES AND DISPLACED PERSONS

April witnessed the uncovering of the long anticipated displaced persons problem and the breakdown of German controls over these slave laborers. The displaced persons were "walking until they met the Americans." They were being caught in the enveloping movement of the thrusting armor. No longer could the German continue to evacuate his labor, being too preoccupied with getting his own columns out of the clutch of the Third U.S. Army. The saturation point had been reached in the interior of the country. The flood gates opened. The roads became alive with every conceivable vehicle, "borrowed" to aid the trek to the centers and toward home.

The limited displaced persons facilities were taxed to the utmost. In many locations there was no water due to destruction, sanitary conditions were primitive, and, with the overcrowding and rapid movement, there were health and security hazards. In some instances camps or collecting points were established in the morning and had received several thousand persons by nightfall. Many of the camps were repeatedly evacuated sometimes as often as daily.

The Army Zone was extended during the month from HUTTENHEIM to beyond the RHINE and the displaced persons plan designed for an Army Zone of normal depth became stretched out thinly over hundreds of miles. Detachments went forward with the Corps and Divisions while other Displaced Persons Teams were pinned down far to the rear, leaving gaps in the operations between the two elements. Displaced Persons Detachment personnel and supporting groups worked at a heroic pace. Excellent cooperation and assistance was received from G-4 Truck and Rail Transportation.

During the month of April, concentrations of displaced persons were reported at the following locations:

* Locations transferred due to boundary change.

Repatriated during the month: 61,367 French, 7,462 Belgians and 1,027 Luxembourgers.

UNRRA Teams came forward to assist. Two teams arrived initially and at the end of the month seven teams were in the Army Zone with forty-three people.

Twelve provisional Displaced Persons Detachments of four officers and eight enlisted men each were organized, trained, equipped and deployed during the latter part of the month.

SECTION V

RELIEF AND SUPPLY

The feeding of displaced persons was the most important of the several activities of the Supply Branch for the month. This necessitated strict control over all captured enemy food stocks in the Army Zone. Responsibility for the collecting, warehousing and issue of all captured enemy food stocks was centralized under the Army Quartermaster who set up such consolidated warehouses at key points. Military Government Detachments drew several hundred tons from these stocks for displaced persons' feeding.

Imported supplies were not drawn upon to any substantial extent during the month because of the adequate stocks of captured material. The Military Government imported stocks which had been consolidated with the Quartermaster Class II and IV Depot Number 12 were moved at the close of the month to the Quartermaster Class II and IV Depot Number 13 at ZIRNDORF (T-3497).

Five truckloads of so-called mountain rations were rushed on 24 April from ERLANGEN (C-3617) to WEIDEN (P-1929) to relieve acute distress among an estimated 10,000 political prisoners uncovered by combat forces in that vicinity.

Civilian food stocks continued to constitute the chief source for the feeding of displaced persons. German civil authorities were required to supply quantities of food to displaced persons centers, but increasing attention was paid to the problem of assuring minimum food requirements for civilian consumption so as to prevent diseases or unrest that might impede military operations.

As the Army Zone moved eastward during the month, civilian food stocks were found to vary. The MOSELLE region being a wine growing section showed deficits in every category. East of the RHINE the situation progressively improved until in BAVARIA considerable local surpluses of potatoes, wheat, butter and cheese were uncovered. Salt, sugar, seeds and fertilizer were everywhere in short supply. Agricultural specialist officers were attached for special regional surveys to Military Government Detachments at FRANKFURT (M-67) and WURZBURG (N-5835) and on their recommendations Military Government trucks were dispatched to the ERFURT (J-3170) area to collect seeds needed for spring planting in the RHINELAND and HESSEN-NASSAU.

Uncovered industrial productive facilities of interest to our forces included tire plants and clothing factories. These, as well as other productive potentials, were brought to the attention of Twelfth U.S. Army Group and Advance Section, Communications Zone so that plans could be made for an early resumption of operations. A large soap factory at SCHLUCHTERN (M-2796) resumed production.

The problem of fuel supply came to the fore as captured stores of POL ran low and coal stocks ebbed. Liquid fuels were supplied to some towns from Army stocks for essential civilian, administrative and agricultural uses. Coal stocks in cars were earmarked for operation in the military railway service leaving essential civilian installations with very little or no solid fuels. The extremely limited rail facilities made the importation of coal for civilian uses impossible, as a result of which many bakeries were closed as a fuel conservation measure.

The following tabulation is a summary of Military Government Supply Depot activity for the month, quantities in net long tons:

	Food	Clothing	Blankets	Soap and Sanitary Supplies	POL
On Hand 1 April	1685.22	69.27	83.5	139.0	.0
Rec'd during April	1661.3	.0	.0	.0	80.0
Issued during April	1733.42	.0	5.2	2.0	80.0
On Hand 30 April	1613.1	69.27	78.3	137.0	.0

LABOR

The functioning of the Arbeitsamter (labor offices) was completely disrupted by the wholesale destruction of basic records and office facilities and the flight of labor officials. During the month, however, some resumption of labor office activity got underway as new officials were named. A few offices were already in a position to assist the recruitment of labor required for military use or essential civilian projects. The TRIER (I-22) labor office referred several thousand civilian workers to jobs during the month.

Labor registration was planned to start shortly in most localities with the intention of consolidating this process with the general civilian registration to be made primarily for security reasons.

TRANSPORTATION

Early in the month two acute problems faced Army Military Government Detachments. One was the inadequacy of Detachment organic transportation. The other was the need for accumulation and salvage of sufficient civilian transportation in each area to provide minimum essential administrative, utility and food distribution services.

A long step was taken toward a solution of both by the adoption, in concurrence with the Army Provost Marshal, of a vehicle registration system set up by this sub-section whereby all civilian vehicles reported by Detachments received a windshield sticker showing a red, white and blue Military Government shield on one side and a statement of purpose, engine number and Detachment stamp on the reverse.

This identification and registry served at once to regularise ownership, provide statistics as to numbers of vehicles in each Land- or Stadtkreis, identify otherwise questionable vehicles to the Military Police and provide a pool from which Military

Digitized by Google

Among the first Military Government detachments to establish such pools were: ERLANGEN (G-3617), FRANKFURT (M-67), WIESBADEN (M-36), NUREMBERG (G-40), BAMBERG (G-2749), OFFENBACH (M-76), MAINZ (M-35) and KRONACH (G-5688).

During the month the Civil Affairs Transport Pool became the Military Government Transport Pool. Comprising four French companies, the 1st, 3d, 6th and 12th, a battalion headquarters, a repair section and a medical detachment, it was moved successively from MAYANCE (U-7793), FRANCE, to TRIER (L-22) to FRANKFURT (M-67) to PURCHEIM (G-3936), GERMANY.

Despite all these moves, the 195 three-ton trucks were nevertheless able to perform 135 missions, from a single truck up to convoys of sixty. In addition the pool moved a total of 697 tons of supplies and approximately 71,533 displaced persons and Allied prisoners of war, performed such diverse tasks as transporting seeds needed for spring planting to delivering 300,000 German language newspapers for the Psychological Warfare Branch to thirty-five cities throughout the Army area.

During the month two additional French Truck Companies were sent to this Section by Communications Zone. Both of these, the 302d and 304th, were turned over to the Provost Marshal for transporting prisoners of war, Allied and German, as well as displaced persons, from forward areas to collection points. Eight of the three-quarter ton trucks, formerly attached to the Transport Pool, were turned over to the LUXEMBOURG Government, thus completing the transfer to the Grand Duchy of thirty-five such trucks. The remaining three-quarter ton trucks were distributed among Displaced Persons Teams as organic transportation needed for camp supply and housekeeping purposes.

The Second Section, Service Platoon, followed the Military Government Transport Pool in all its moves and continued its work of vehicle repair and maintenance, battery exchange and re-charging and tire inspection, repair and replacement for Detachment organic transportation. The Section also repainted vehicles, painted direction signs for Detachments and displaced persons centers and drew rations, fuel and lubricants for the French Truck Companies.

SECTION VI

GOVERNMENTAL AFFAIRS

Advances of tactical troops required the establishment of Military Government in large areas of GERMANY and AUSTRIA and the organization of Civil Affairs functions in CZECHOSLOVAKIA. Military Government operations in AUSTRIA were exercised in Division and Corps areas and were limited to the posting of proclamations and notices, enforcement of curfew, circulation and arms surrender measures and the control of displaced persons, activities essential to military security. Fraternization was forbidden throughout AUSTRIA.

In CZECHOSLOVAKIA, the area of control was too small to supply definitive information regarding the character and strength of local government. Reports from G-5 Sections of Corps and Divisions and Military Government officers and Detachments indicated a stable situation. Fraternization was permitted.

The variety of Military Government problems in GERMANY during the month of April was indicated by the areas under its jurisdiction, the phases of military operations in which it operated and the political character of the populations encountered. During part of the month the RHEINPROVINZ was under the Army. In this political sub-division, cessation of active military operations gave opportunity for the development of local governmental authority. Screening and selection of trustworthy and efficient officials and staffs, organization of food, transportation and utilities and the promotion of agriculture were emphasized. Limited movement of refugees to their homes was permitted when approved by the Detachment having authority in the place of destination. Signs of the assumption of responsibility by officials were observed. At TRIER (L-22), the Regierungs-president called a meeting of the Landrats to explain the Military Government program and to coordinate their activities; and Dr. Franz Rudolph Bornewasser, Archbishop and anti-Nazi, returned to his diocese and pledged his support to Military Government. In the Kreise of KUSEL and ROCKENHAUSEN, the Landrat directed all youths between twelve and twenty years of age to work in the fields to insure production of food and to combat possible werewolf activities.

East of the RHINE, in the Province of HESSEN-NASSAU, substantial progress was made in the organization of government. In THURINGIA and BAYERN, where Nazi influence was more evident, the chief emphasis was placed upon security measures. Many officials had fled with the German Army, several attempted to defend their cities, and a few committed suicide. Detachment commanders reported the people to be docile and dependent, but with some expressing continued belief in Nazi principles. When the crimes of the concentration camps at HERZOGF (J-1152) and BUCHENWALD (J-4875) were exposed, it was evident that the bulk of the population felt no sense of responsibility for the commission of the crimes.

The rapid movement of the Army and lack of trained Military Government Detachment personnel made it necessary for tactical commanders to assume temporary responsibility for Military Government in forward areas. This action was necessary under the circumstances, but variations in orders and procedures and assumption of authority by commanders in rear areas weakened the program of Military Government in many instances. Steps were taken to secure a clarification of the situation.

Progress was made in the organization of local government, but it was clear that security measures were still of primary importance in the Army area.

On 2 April, the functions of the Public Health sub-section were transferred to the office of the Surgeon.

LEGAL

Throughout the month the primary legal problem was the supervision and control of Military Government Courts. Calls for legal advice on other problems were still of minor importance. Emphasis was placed throughout the period on the necessity for sentences sufficiently stringent in character to have a real deterrent effect. The few tendencies toward extreme leniency were corrected.

Records of all cases tried during the period were administratively reviewed by the Legal sub-section. A total of 610 cases such cases were considered in which 64,265 marks in fines were collected and prison terms of 3,142 days imposed for the 794 persons tried. In the month of April 109 Summary Courts were in operation in the Army Area, an unusually large number of courts because of the constantly shifting boundaries. Ten Intermediate Military Government Courts and four General Military Government Courts were appointed. All Corps and Divisions were requested to forward copies of orders appointing Military Government Courts to this Headquarters.

As had been the case previously, the majority of Summary Court cases were concerned with curfew and travel violations. After the initial trials, a definite decrease in violations was noted by each Detachment. In DARMSTADT (M-64), for example, the first four days of trials produced a reduction in violations from over two hundred to six. Of five cases of illegal possession of arms the maximum sentence imposed was one year, the maximum fine 10,000 marks. Seven persons suspected of underground activity were held on charges of illegal possession of arms. All these cases were referred to General Military Government Courts.

With the forward movement, several concentration camps and prisons were uncovered. Prison screening teams were secured from Twelfth U.S. Army Group and proved invaluable for the limited time they were available. Two prison teams from Third U.S. Army personnel, of four officers and six enlisted men, were organized to operate prisons and act as screening personnel. Five additional teams of similar size were requested. A total of 28,711 political prisoners and criminals were found in the two concentration camps and six prisons.

International attention was centered on the notorious concentration camp at BUCHENWALD (J-4875). Conditions of unbelievable misery and degradation prevailed throughout the camp. Correspondents and news cameramen secured complete coverage of the conditions existing in BUCHENWALD. Prison officials from Third U.S. Army secured food, medical care, bedding and clothes for the 20,000-odd prisoners and began the screening prior to the time a boundary change passed responsibility to the First U.S. Army.

PUBLIC SAFETY

The rapid movement over a large area made security and aid to military operations the most important functions of Public Safety. This problem was made more serious by stragglers from the Wehrmacht in isolated areas, members of the German army out of uniform, large numbers of displaced persons, prisoners escaping from prisons when overrun by tactical troops, and the movement of Detachments from one location to another without sufficient opportunity to organize and put into effect adequate safety measures.

As a result there occurred offenses against the civilian population by displaced persons, offenses against the German population by German civilians who looted property and places of business, offenses by civilians against Military Government of a minor nature (curfew and circulation) and a few incidents of more serious offenses such as failure to surrender arms. Movement of displaced persons interferred with military traffic in a few instances.

The Public Safety sub-section took steps to promote security through close liaison with the Provost Marshal. Following requests for security guards, the 70th Infantry Division was placed in the rear area and artillery, anti-aircraft and other units in the forward area, were employed for the same purpose. Detachments were instructed regarding the importance and necessity of keeping all civilian and displaced persons traffic off Main Supply Routes and to enforce strictly regulations treating with curfew, circulation and surrender of arms.

Prompt execution of categorical arrests and security threats and their movement to Army Interrogation or Internment Centers was effected. Boards were selected to review cases of prisoners at BUTZBACH (P-5665), FRANKFURT (M-67) and HAMBURG (G-2749) and concentration camps at BUCHENWALD (J-4875) and FLOSSENBERG (P-3336).

The situation was further improved by the arrival of Detachments to pinpointed areas, assuring opportunity for organizing public safety on a more permanent basis.

FINANCIAL

Accounting reports for the month of March were received from thirty five Military Government Detachments, reviewed and forwarded with appropriate comments to Twelfth U.S. Army Group. Expenditures from Military Government funds were at a minimum. Receipts consisted largely of fines and abandoned money taken into temporary protective custody in accordance with paragraph 5 d. (3), G-5 Operational Instructions Number 9, Twelfth U.S. Army Group, 1 March 1945.

The sub-accountant of this sub-section had on hand 229,432 marks at the first of the month. During the month 453,529 French francs were transferred to the Currency Section for France through the medium of a spearhead deposit. Balance of French francs remaining were 60,000, consisting of twelve 5,000 franc notes which were not acceptable to Army Finance because of denomination of the bills.

Numerous cases arose during the month calling for decisions as to the status of funds turned in to Army Finance purporting to be "captured enemy funds." In all cases where money was to be returned to owners it was found that the particular Finance Disbursing Section involved was located far from the area to which the money was to be returned. In such cases this sub-section had such funds transferred by spearhead deposit to this Headquarters where they held for disposition at a later date.

This sub-section participated in the training of twelve Third U.S. Army Detachments formed to supplement Detachments pinpointed for specific areas. One sub-accountant was appointed to service these twelve Detachments.

Purchasing and Contracting officers were not appointed on any Detachments under control of this Headquarters as it was possible to transfer all necessary expenditures, particularly payrolls, to local authorities. In one case only, the hiring of thirty-eight interpreters for Counter-Intelligence Corps screening teams at displaced persons centers, was the service of an Army Finance Disbursing Section used. These latter payments were made by the Purchasing and Contracting officer, this sub-section.

With the rapid advance of Allied Forces during the month, it was natural that important elements of the German Financial machinery would be uncovered by troops of this Headquarters.

DECLASSIFIED

Reichsbankhaupt[illegible] uncovered at FRANKFURT (M-[illegible]) 41,000,000 Reichsmarks immediately [illegible] at the end of the month under strict control of Military Government. As evidence of the thorough-going nature of the de-Nazification program at FRANKFURT (M-67), 110 bank officials were suspended or removed out of 239 cases examined.

The central German army and navy finance office (OKW Finance Command) was uncovered at UNTERLETTEN (J-5344) along with important records, personnel and accounting machines. At OHRDRUF (H-0568) there was uncovered a branch office of the Reichskommissar für die Behandlung Feindlicher Vermögen (comparable to U.S. Alien Property Custodian). Employees who were interrogated furnished information which was forwarded to Twelfth U.S. Army Group.

Elements under this Headquarters discovered approximately 220 tons of gold, 2,750,000,000 Reichsmarks in currency, German State art treasures and suitcases of loot buried in a salt mine at MERKERS (M-5849). All of these objects were moved during the month to vaults in FRANKFURT (M-67) and placed under the custody of the European Civil Affairs Currency Section for GERMANY. Later, gold and foreign exchange held or hidden by the Reichsbanks in COBURG (C-3090), NURNBERG (C-40) and WURZBURG (M-5835) were sent to the same depository. The gold at COBURG amounted to approximately 100 kilograms; at NURNBERG about 1,500 kilograms. At NURNBERG it was ascertained that the director of the Reichsbank had burned 750,000,000 French francs prior to the entry of the American troops. These francs had been sent from WURZBURG (M-5835) where they had in turn been received from the Reichsbank in FRANKFURT (M-67).

In the course of the month banks were reopened and banking services were resumed in the following main locations: ALZEY (M-2727), BAD KREUZNACH (M-0938), BAMBERG (C-2749), WITTLICH (L-3954), DARMSTADT (M-64), FRANKFURT (M-67), HANAU (M-67), HASSFURT (M-9863), JENA (J-66), LIMBURG (M-2398), MAINZ (M-35), NEUNKIRCHEN (Q-5982), NEUSTADT (C-7140), NURNBERG (C-40), OFFENBACH (M-76), SCHWEINFURT (M-7944), TRIER (L-22), WADERN (L-3805), WIESBADEN (M-36) and WURZBURG (M-5835).

About fifty percent of the banks elected to reopen without restrictions on withdrawals and there seemed to be ample cash resources available throughout the area. In two cases where restrictions on withdrawals were in effect, it was the opinion of the bankers that the terms of General License No. 1 were too liberal, (General License No. 1 permitted persons whose property was blocked pursuant to Military Government Law No. 52 to withdraw from their accounts for living expenses up to 300 Reichsmarks in any one calendar month). This view was confirmed by several Military Government officers. Authority was granted from this Headquarters to lower the limits of General License No. 1 to fit particular situations.

Public finance functions were gradually resumed during the month, but usually only after banks had been reopened. It was not expected that collections on account of taxes would be sufficient to finance local public authorities for several months. In the meantime, however, Military Government Detachments were instructed to order, where necessary, that loans be made by the banks to cover the needs of local authorities.

Other than the preparation of surveys there was little activity in the field of Property Control. The automatic freezing and blocking provisions of Law No. 52 were sufficient to cover most situations. Where Nazi party headquarters were not destroyed they were used for the most part by the Army for the housing of military personnel. Detachments were instructed to use the banks, when open, for the deposit of Nazi party funds, placing such funds in accounts blocked under the provisions of Law No. 52.

Preparations were made for entry into AUSTRIA through the distribution of available financial decrees, orders and licenses to Corps and Divisions. Letters to the population and to the banks regarding the temporary use of Allied Military Marks were prepared and arrangements were made for printing them. Handbooks on AUSTRIA were distributed to Detachments covering the few differences that existed in the handling of financial and property control matters as against their treatment in GERMANY.

All reports received by this sub-section indicated that there were no noticeable price increases in occupied areas of GERMANY. Black market activities were at a minimum, and troop purchases [illegible] because of existing non-fraternization policies.

CHAPTER 12
MAY OPERATIONS

SECTION I

GENERAL

With Third U.S. Army spearheads deep into CZECHOSLOVAKIA and AUSTRIA, G-5 was forced once more to train and deploy quickly Detachments in the newly-won territory. Twenty-five such teams were constituted, equipped, trained and sent forward during the final week of the European conflict, another tribute to the flexibility of the Section's operation and its ability to improvise rapidly in an emergency. Sixty-five teams were in the field at the close of operations. Several Detachments placed by Third U.S. Army in HESSEN-NASSAU were lost to the Ninth U.S. Army on boundary changes.

Another vast horror camp—the establishment for political prisoners at LINZ (M-8587), AUSTRIA—was uncovered during the period. Emergency foodstuffs, medical supplies and personnel were rushed to the scene to aid the sick and the hungry and to bury the dead. The 16,000 prisoners at LINZ, however, were but a fraction of the now huge problem of handling displaced persons in the Third U.S. Army Zone. When the war ended there were 200,000 of them living in fifty-nine camps and another estimated 70,000 living in villages and rural areas. Only fifteen percent of them were Western Europeans; as yet no firm plans had been made for the repatriation of the great mass of Eastern Europeans. Some 15,754 Western Europeans were repatriated from WURZBURG (M-5835), a collection point.

With the war close to an end, the emphasis upon security and military expediency veered to the real mission of Military Government, the de-Nazification and reorganization of the German government. German officials with any of the odor of Nazidom about them were removed and replaced.

SECTION II

PERSONNEL AND ADMINISTRATION

Authority was received from higher headquarters for the assignment to Military Government activities of fifty officers, five warrant officers and seventy-five enlisted men from Provisional Military Government Detachments organized by and deployed in Third U.S. Army Area.

Numerous applications for assignment to duty with Military Government were processed during the period. Qualified applicants were placed on temporary duty with active Detachments pending final action by higher authority.

Letter, European Theater of Operations, United States Army, subject: "Establishment of Civil Affairs Sections," dated 23 April 1945, was amended to include a statement that in the event an organization was transferred from the theater or that it became non-operational, grades and ratings would be withdrawn and re-allotted to European Civil Affairs Division. Personnel assigned against these grades would be reassigned to European Civil Affairs Division.

A survey was made of the many new Military Government Detachments deployed in Third U.S. Army Area and shortages of fifty-eight officers, twenty-five warrant officers and 107 enlisted men were noted. Immediate steps were taken to assign personnel against these existing shortages.

Distribution of instructional guides and other pertinent directives was made to more than twenty-five Military Government Detachments newly attached to this command.

Machinery was started for the forming of additional [illegible] objectives.

SECTION III

INTELLIGENCE

Long range planning for the crucial period when hostilities came to an end and the occupational phase began occupied the attention of the Intelligence Branch during the period. Twenty-five new teams, slated for locations in AUSTRIA and CZECHOSLOVAKIA had to be instructed in their intelligence mission, briefed on the system of reporting back to G-5 at Corps and Army, furnished with the publications and handbooks necessary to their operation and linked into the communications and courier system of G-5.

Plans were made for a more comprehensive courier service connecting up the various echelons of Military Government.

Closing chapters of the After-Action report and other reports for the history of the Third U.S. Army were prepared and forwarded. One information bulletin was published in the period as well as a weekly and a semi-monthly report to Twelfth U.S. Army Group.

Outstanding events of an intelligence nature for the period were the capture of three German corvettes complete with their naval crews by a Military Government Detachment in a rowboat on the DANUBE near LINZ (M-8587) and the capture of the German general of the Second Panzer Division by a Military Government Public Utilities officer at BAMBERG (C-2749).

A doctor was discovered working in a BAMBERG (C-2749) hospital who had treated Hitler from July to November 1944 for injuries received during the bomb attempt on the Fuehrer's life. The injuries were to the side of the head and affected Hitler's hearing, the doctor said.

COMMUNICATIONS

The telephone equipment at [illegible]BURG (C-2749) and KEMPENICH (U-15) were found intact, while the equipment at BITBURG (U-75) was ninety percent destroyed by a direct bomb hit.

The telephone repeater station at [illegible]BURG (U-15) was not damaged. This was one of the key points in the communications from GERMANY to AUSTRIA.

PUBLIC WORKS

In the closing days of the war, work progressed rapidly on the repair of high tension power lines in the German grid. The line from the hydro-electric station in the vicinity of WURZBURG (M-5835) was extended to SCHWEINFURT (M-7944) and thus provided power to it as well as surrounding communities.

Electric power was also restored in DROGENDORF (U-8340), FREISING (Y-9786), GRAFENAU (Q-1544), SCHWARZENFELD (U-1997) and VIECHTACH (U-7666).

With the renewal of electric power, and the repair of breaks in the water mains caused by bombing and battle action, it was possible to restore water to DROGENDORF (U-8340), FREISING (Y-9786), GRAFENAU (Q-1544), SCHWARZENFELD (U-1997), VIECHTACH (U-7666) and KELHEIM (U-0344).

SECTION IV

PLANS AND OPERATIONS

By the beginning of the month, the bulk of Detachments were operating in their pinpoint locations. It was felt, since they were operating in many instances far from tactical units, that a weekly information bulletin should be published showing locations of available security guard and Military Police forces in the Army area, should a situation arise warranting their need. In accordance with this plan, the first of these bulletins was published on the second of the month.

The Army's objective again turned from [illegible]

Digitized by Google

Detachments pinpointed for AUSTRIA received and were deployed in their pinpoint locations, after a short orientation by various branches of the Section.

On 8 May, Detachments were deployed in the following towns:

AMBERG (G-9802)	KEMNATH (G-6488)
ANSBACH (T-0022)	KITZINGEN (G-4674)
ASCHAFFENBURG (H-0155)	LANDAU (G-6520)
BAD KISSINGEN (H-6781)	LANDSHUT (G-2463)
BAMBERG (G-7429)	LINZ (G-6487)
BAYREUTH (G-7455)	LOHR (G-3246)
DINKELSBUHL (G-3004)	MEMMINGEN (T-0813)
EBAN (G-5880)	MUNICH (G-6474)
EICHSTAETT (G-8340)	NEUBURG (G-1494)
ERLANGEN (G-7291)	NEUMARKT (G-6472)
FEUCHT (G-6476)	NEUNBURG (G-8025)
FREISING (G-6417)	NEUSTADT (G-6456)
FULDA (G-3236)	NUERNBERG (G-3793)
GEROLZHOFEN (G-6530)	OBERAMMERGAU (G-6713)
GRAFENWOEHR (G-7786)	OBERNDORF a. d. ALTMUEHL (G-6744)
GRAFING (G-2659)	OBERNDORF a. d. DONAU (G-1935)
HERLOLZHEIM (G-1129)	OCHSENFURT (G-6900)
HOECHST (G-3462)	OSTHEIM (T-0476)
HRAFENAU (G-1444)	PASSAU (G-2213)
INGOLSTADT (G-5178)	REGENSBURG (G-3429)
KAUFBEUREN (G-6453)	REHLINGHAUSEN (G-8095)
KEMPTEN (G-6707)	ROTHENBURG (G-7768)
KIEL (G-9798)	SCHWABACH (G-1455)
KITZBUEHEL (T-0975)	SCHWING (G-4777)
KNITTELFELD (T-0125)	SCHWEINFURT (G-6616)
KOELLEITN (G-6744)	SETTH (T-0478)
KITZINGEN (G-7759)	STEIN im INNTAL (G-2773)
SCHWABING (G-1455)	STRAUBING (G-6744)
SCHWABACH (T-3482)	STUTTGART (G-1494)
SCHWEINFURT (G-7964)	TRAUNSTEIN (G-3133)
STRAUBING (G-6442)	WUERZBURG (G-3443)
TIROLGOSTERREICH (G-3652)	ZIRNDORF (G-5835)
ZITTAU (T-0161)	

DISPLACED PERSONS AND REFUGEES

The flow of displaced persons into camps throughout the Army Zone continued during the period. Over 20,000 displaced persons were living in fifty-nine camps and an estimated additional 70,000 were living in villages and rural areas. Figures indicated that approximately fifteen percent were Western Europeans. These were evacuated from NUERNBERG (G-5835) as follows:

TO

1 May	1600	French	LUNEVILLE (G-4596)
2 May	3200	French	LUNEVILLE (G-4596)
3 May	1215	Belgians	LIEGE (G-4126)
3 May	400	Dutch	MAASTRICHT (G-5456)
3 May	1572	French	LUNEVILLE (G-4596)
4 May	1600	French	LUNEVILLE (G-4596)
4 May	570	Dutch	MAASTRICHT (G-5456)
4 May	960	Belgians	LIEGE (G-4126)
5 May	1578	French	LUNEVILLE (G-4596)
6 May	1519	French	METZ (G-2485)
8 May	1500	French	LUNEVILLE (G-4596)

Increased efforts were being made to segregate displaced persons by nationality groups. Camps were set up respectively for Russians, Poles, Yugoslavs and Czechs. Three camps were set aside exclusively for the trans-shipment of Western Europeans including French, Belgian, Dutch and Luxembourgers.

Three UNRRA teams, after a brief orientation, were deployed to assist in camp operation under the supervision of UNITED STATES military personnel.

SECTION V

RELIEF AND SUPPLY

Continuing with their task of stimulating agricultural production, the two agricultural specialists attached to G-5 remained on duty with the Regierungsbezirk Detachments at NUERNBERG (G-5835) and ANSBACH (T-0022). In the province of HESSEN-NASSAU a considerable boost was given to planting by the discovery of 385 tons of seed and 1,900 tons of fertilizer at FRANKFURT (G-67). An additional 219 tons of seeds were brought into the FRANKFURT region from surpluses in the seed producing area at ERFURT (J-37).

In furtherance of the agricultural effort, the 14th Armored Division and the 90th Infantry Division released over 1,000 captured ehrmacht horses to the civil authorities in their respective areas for utilization in farm operations.

The problem of fuel supply for essential civilian transportation and mechanized agricultural activity loomed larger as existing German stocks were drained. Requisitions totalling 9,100 gallons of gasoline and 5,000 gallons of diesel oil were approved for drawing and distribution by Detachments throughout the Army Zone.

The coal shortage was even more serious for there were no Army stocks from which requirements could be met. The difficulty in this respect was the lack of rail transportation because, though millions of tons of coal were above ground in the mining areas of [illegible], none of it could yet be brought into the Army Zone. A requisition for coal for essential civilian uses was placed with the Army Quartermaster, upon request of that Section, for delivery in June and July. On 8 May 1945 Detachments were directed to submit their normal monthly coal estimates by areas for essential civilian services. Indicative of the critical fuel shortage was the stoppage of the [illegible] water supply for lack of fuel. It was necessary to rush diesel oil from Army stocks to provide the necessary power.

The collection, storage and issue of captured enemy supplies continued to be the responsibility of the Quartermaster. Displaced persons were supplied mainly from civilian stocks but also from the two captured enemy material depots at NUERNBERG (G-5835) and FURTH (G-3602). Among other deliveries, clothing from the latter point was dispatched to provide for 6,000 of the former political prisoners quartered at EBAN (G-5880).

A new approach to the problem of industrial production was developed with the establishment of a Production Control Agency within G-5. This agency was made responsible for the harnessing of all German industry to the demands of the Allied Forces. In the meantime some essential production had been resumed under the guidance of Military Government Detachments, including a shoe factory at NUERNBERG (G-40).

LABOR

An important development, with possible widespread ramifications, was the discovery of a complete microfilm of the labor registration records of the ANSBACH (T-0022) Arbeitsamt. Indications were that this filming was accomplished under the direction of the National Ministry of Labor and that similar records might be uncovered elsewhere.

The NUERNBERG (G-40) Arbeitsamt completed its preliminary registration by consolidating this process with the general security registration. The standard registration card was revised to include entries essential to the control of labor.

TRANSPORTATION

As of the ending of hostilities the strength of the Military Government Transport Pool comprised four French Truck Companies (101st, 103d, 106th and 112th) equipped with fifty three-ton Canadian Dodge trucks each, a Battalion Headquarters, Maintenance Repair Section and a Medical Section. Personnel totalled 465 enlisted men, fifteen officers and two nurses.

In line with plans for redeploying the tactical units designated to serve as occupying forces in the Army Area, the French Truck Companies were allocated one each to the III, XII and XV Corps, with the fourth company to be retained as Army G-5 reserve and the Battalion Headquarters to go to the III Corps.

Missions executed from 1 May to 8 May comprised the usual collection of displaced persons of many nationalities from towns, villages, roads and collection points and their transportation to camp centers. Captured enemy food and clothing supplies were picked up at various captured enemy supply warehouses and transported to the several displaced persons centers in the Army Zone.

The following statistics indicate the volume of work accomplished by the four French Truck Companies in the Army Zone during the period:

Truck Company	Displaced Persons	Supply Tonnage	Kilometers Travelled
101st	16,940	2,839	45,752
103d	24,350	128	66,310
106th	5,933	240	28,790
112th	6,463	1,521	40,938
Total:	53,686	4,728	181,790

In the performance of the above the Military Government Transport Pool completed 112 different missions and hauled 29,000 gallons of gasoline.

On 5 May the Second Section, Service Platoon moved from FRANKFURT (G-67) to [illegible] (G-4117), near [illegible] (G-3617). In addition to the normal activities carried on in April, plans were perfected and approved for establishment of a system of mechanical inspection for all Military Government unit vehicles at regular intervals.

SECTION VI

GOVERNMENTAL AFFAIRS

As the cessation of hostilities approached, a chief objective of Military Government, the de-Nazification and reorganization of the German governmental system was brought into relief. Security measures received first consideration, but it was recognized that the retention of German officials could no longer be generally approved upon the ground of military necessity or expediency.

Clarification made it possible to begin the complete de-Nazification of official personnel and the selection of non-Nazi successors.

Progress was made in the selection of Buergermeisters and Landrats. Detachments were directed to organize the Regierungsbezirke of Land BAYERN.

LEGAL

Instructions for Austrian and Bavarian Military Government Detachments newly attached to this Headquarters prior to movement to pinpointed areas required much of the time. The emphasis was placed primarily on matters pertaining to jurisdiction, procedure, fines, imprisonment and appointment of courts. Summary Military Government Court officers were appointed for all of these Detachments, if none had been previously appointed.

A new policy was initiated to correct minor errors in form. All errors not sufficiently important to prejudice the rights of the accused, yet indicating a tendency to laxness were collected and published with proper corrections for all Military Government Detachments. Some of the most often repeated mistakes were: reading charges to the accused without giving him a copy, failure to draw charge sheets in both German and English, but relying on a verbal translation, omission of a commitment form for imprisonment, repeated use of Section 21, Article II, Ordinance 1 when the violation of a law or ordinance itself provided a penalty. Many courts neglected serial numbering and in some instances the prescribed rate of one day for each ten Reichsmarks default in payment of fines was neglected.

Review of cases of political prisoners in the concentration camps at [illegible] (G-2083), FLOSSENBURG (T-3336) and in prisons at AMBERG (G-9802), BAYREUTH (G-75), BAMBERG (G-2019), BUTZBACH (G-6704), NUERNBERG (G-40) and STRAUBING (G-5542) necessitated the development of three prison terms and the supervision of Detachments performing that function. A mobile Counter-Intelligence Corps team assisted in screening United Nations nationals, and political prisoners were released upon its approval.

DECLASSIFIED

PUBLIC SAFETY

The last days of the war found the enemy in complete rout and disorder. Thousands of civilian prisoners in concentration camps and [illegible] were released [illegible] in camps and installations [illegible] safety officers [illegible] while Allied [illegible] Counter-Intelligence officers for re-[illegible] were sent to prisoner of war enclosures [illegible] documents.

Military Government Detachments and Security Troops uncovered many categorical arrests and security threats who were sent to Counter-Intelligence Corps for interrogation and detention. In order to devote the maximum number of hours to cultivation and raising of crops, the curfew was extended from 2000 hours to 0700 hours to 2100 hours to 0600 hours.

FINANCIAL

Thirteen banks of REICHSBANK (B-15), including a Reichsbankstelle, were officially opened for business on the seventh of the month. A number of Detachments reported shortages of small notes in their areas and arrangements were consequently made to make change with Reichsbanks in different areas who were better situated.

Expenditures of troops in the liberated territory of CZECHOSLOVAKIA provoked the question of monetary exchange. During the German occupation, units of exchange in CZECHOSLOVAKIA were the Reichsmarks and the Kronen. Upon liberation the Czechoslovakians refused to accept Reichsmarks, and since troops had Marks, though Allied issue, the Czechoslovakians hesitated to accept their currency. Reports were received of increasing dissatisfaction on the part of both troops and natives with great confusion as to exchange rates.

At their request, G-5 Section, XII Corps was advised, with the agreement of higher authority, that the promulgation of a rate of exchange between Kronen and Allied Military Marks was the responsibility of the Czechoslovakian Government as a sovereign liberated territory. It was suggested that American Army finance specialists advise Czechoslovakian authorities to ascertain a rate at which exchange would be satisfactory to both troops and Czechoslovakians.

Reports were received of gold and treasure in the custody of the National Bank of [illegible], evacuation from the capital city of [illegible] to SPITZ am DONAU (V-9018) in Landkreis [illegible]. The Fiscal Officer accompanied by a specialist from Twelfth U.S. Army Group proceeded to the locality to arrange the transportation of this gold and treasure to a central depository at [illegible] (U-467).

Officers of Detachments going into AUSTRIA were briefed on fiscal procedures. A sub-accountant was appointed on each Detachment. Wherever possible, the Local officer was appointed as sub-accountant since receipts of Detachments were largely fines from Military Government Courts.

CHAPTER 13
LESSONS LEARNED & CONCLUSIONS

PERSONNEL AND ADMINISTRATION

1. Lessons Learned.

a. Throughout the entire military operation there existed a serious shortage of officers and enlisted personnel within Civil Affairs/Military Government Detachments in Third U.S. Army Zone.

b. "I" type Military Government Detachments (three officers and six enlisted men), which exercised governmental control over an area of from two to four Kreise, did not have sufficient personnel for efficient operation.

c. Enlisted personnel possessing excellent linguistic abilities were of prime importance to the operation of Detachments.

d. During the combat phase Military Government Detachments were required to prepare many reports and surveys. Detachments did not have the time nor sufficient personnel to comply expeditiously with these requirements. Reorganization of the German government, reconstruction of public utilities, and providing for displaced persons required the full time of Detachment personnel.

2. Conclusions.

a. Full strength Detachments should be furnished initially and a pool of officers and enlisted personnel maintained on call by Armies to make up shortages.

b. The authorized strength of "I" type Detachments should be increased to four officers and eight enlisted men.

c. Reports and surveys should be held to an absolute minimum until civil government and communications have been restored.

COMMUNICATIONS

1. Lessons Learned.

a. Civilian communications personnel and facilities were not employed with maximum effectiveness because military units made independent uncoordinated demands on civilians and valuable communications charts, vehicles, material and tools were removed for other than communication work or thoughtlessly destroyed.

b. The return to normal civil administration was delayed by lack of communications assigned to purely civil use and the [illegible] of adequate censorship personnel to check security.

2. Conclusions.

a. More effective use of civilian personnel and facilities could be obtained by assigning a trained Military Government Communications specialist to each Military Government Detachment controlling a key city in order to coordinate military requests on civilians and safeguard civilian charts, vehicles, material and tools.

b. Certain intercity circuits should be reserved for civil administration and adequate censorship personnel, available on demand, should be provided to check security at key points.

ELECTRIC POWER

1. Lessons Learned.

a. There was an immediate need for electric power and high tension circuits should be repaired without delay.

b. Security was occasionally jeopardized when high tension lines from enemy territory continued to operate through the combat lines. Most high tension lines were provided with carrier operated telephone communications, so that communications were available as long as electric power continued to flow.

2. Conclusions.

a. High tension electric power repair teams should be organized and assigned specific missions prior to the operation. They should remain until missions are completed, using civilian personnel and material to the maximum.

b. Tactical forces should include specially trained personnel to disconnect but not destroy carrier communications systems. Censorship personnel should be placed at key substations to safeguard security when power grids are repaired.

OPERATIONS

1. Lessons Learned.

a. Military Government units and individuals with a long period of theoretical training took considerable time to reach maximum [illegible]

b. Civil Affairs and Military Government Detachments in many cases were less effective from lack of training in military subjects in general.

c. Military Government Detachments attached to Armies for deployment were often late in arriving at "pinpointed" locations due to changes in the tactical situation.

2. Conclusions.

a. Units and individuals should be given only the fundamentals of military government in schools and placed in the field for practical training as soon as possible.

b. Scope of training for military government personnel should be widened to include military subjects of value in the field or officers with general experience selected for military government duties.

c. Emergency Military Government Detachments must be formed to take the place of pinpointed Detachments which are delayed due to changes in the tactical situation.

REFUGEES AND DISPLACED PERSONS

1. Lessons Learned.

a. There was insufficient trained personnel to care for and control displaced persons who left their respective locations as soon as German troops withdrew and before our troops gained control.

b. Those charged with the care and control of displaced persons soon found out that there were not enough facilities and transportation available to care adequately for the troops, Allied prisoners of war, German prisoners of war and displaced persons.

c. CIC personnel to screen displaced persons expeditiously was inadequate.

d. It was found necessary to have train commanders, medical officers and guards for movement of displaced persons by train.

2. Conclusions.

a. Prior to an operation sufficient Displaced Persons Teams must be organized, equipped and trained. Troops for guarding camps and collecting displaced persons must be provided. Displaced Persons Detachments are better for displaced persons operations than local Military Government Detachments because of the specialized nature of the work. Where Displaced Persons Teams are used, their status should be clarified with the local Military Government Detachment. Armies or service units following Army must be ready to relieve the camps as Army moves forward, otherwise Displaced Persons Detachments are pinned down and gaps develop between forward and rear units. To conserve administrative personnel and to avoid dispersal of guard units, camps of large size, ten to fifteen thousand capacity, are desirable. Armed guards in ample numbers must be available to Detachments to control displaced persons and conserve supplies. Reliance cannot be placed on local units to secure troops during a moving phase as these units shift rapidly and are not oriented in their job.

b. Sufficient transportation to handle the movement of displaced persons should be made available. Wherever possible, evacuation of displaced persons should be by returning convoys which necessitates complete integration with G-4 and planning in advance of operations. The available facilities must be carefully allocated to see that displaced persons are properly housed and fed.

c. Screening teams should be provided at an early date so that adequate screening may be had before displaced persons are moved rearward.

d. In view of the limited size of a Displaced Persons Detachment, train crews consisting of a train commander, a medical officer, and one guard for each car should be provided by service areas. They should come forward as a unit. Trains for evacuation should be equipped with supplies. Feeding stations should be established through the service areas at approximately 100-mile intervals for returning convoys and trains. The type food provided locally and by relief supplies is not proper for feeding badly undernourished persons as found in concentration camps.

DECLASSIFIED

Digitized by Google

SUPPLY

1. Lessons Learned.

Many tactical and service units, unaware of the plans for conservation or rehabilitation of the essentials of a civilian economy, allowed the German people and others to seize or destroy public and private property, especially food, without regard to economic consequences.

2. Conclusions.

All military units, down to companies, should be briefly instructed in the salient Military Government functions and responsibilities of the Army Commander, particularly conservation of economic resources.

TRANSPORTATION

1. Lessons Learned.

a. Field experience, particularly when Military Government Detachments had reached their pinpointed locations, soon demonstrated the organic transportation authorized for such Detachments was inadequate.

b. Many vehicles not authorized by T/E were needed to equip emergency Military Government and Displaced Persons Detachments.

c. Foreign Liaison Officers attached to Army for various special Civil Affairs/Military Government assignments appeared in increasing numbers as V-E day approached, all on competent orders, but most without adequate personal equipment or transportation.

2. Conclusions.

a. Military Government Detachments should initially be authorized vehicles on a basis of one vehicle per officer in "I" and "H" Detachments and one vehicle to each two officers in "E", "F" and "G" Detachments, with one enlisted driver for each vehicle.

b. In granting authority for emergency Military Government or Displaced Persons Detachments, adequate government issue transportation or captured vehicle equivalents should be authorized to provide necessary mobility. In addition, not less than one three-ton truck per thousand displaced persons should be provided for camp housekeeping requirements.

c. All personnel attached to a lower unit for special missions should be sent forward equipped and with authorized transportation.

MILITARY GOVERNMENT COURTS

1. Lessons Learned.

Eighty percent of the cases tried by Military Government involved curfew and circulation violations and were tried by Summary Military Government Court. The effectiveness of these courts in deterring violations was found to depend on immediate establishment of Summary Courts by Detachments, quick trial, and adequate punishment. Summary Courts in large cities, such as FRANKFURT (M-67), were delayed by the preparation of prescribed case records and by the necessity of providing counsel when requested. It was found that some courts were not familiar with the preparation of required forms.

2. Conclusions.

a. Commanding officers of Detachments should be given authority to appoint Summary Military Government Courts and required to report appointments to the Headquarters to which they are responsible and to Army G-5.

b. Simple case records should be provided for the trial of circulation and curfew violations.

c. The appointment of defense counsel in circulation and curfew cases should be left to the discretion of Summary Courts trying cases.

d. Instruction should be given to all Summary Courts as to the necessity of adequate punishment and in the preparation of prescribed forms.

PRISONS

1. Lessons Learned.

Personnel for the control of prisons was inadequate, and while initiative and resourcefulness was shown by Military Government Officers in emergency problems, the review of cases of political prisoners and the need for trained prison officials for the larger prisons were evident.

2. Conclusions.

It is recommended that one highly trained prison official be assigned to Army and to each Corps to reorganize and supervise administration of prisons.

PUBLIC SAFETY

1. Lessons Learned.

a. Displaced persons and Allied prisoners of war proved to be the greatest immediate threat to Public Safety. German civil police could not control these elements.

b. Security troops moved to new locations without giving notice to Military Government Detachments, leaving important installations unguarded. In the interval of time before the arrival of other security troops, opportunity for looting, destruction and damage was given to displaced persons, Allied prisoners of war and civilians.

2. Conclusions.

a. Sufficient military police or security guards must be provided to control displaced persons and Allied prisoners of war.

b. Security troops should not be moved from a location until such time as they are relieved by other security forces.

ORGANIZATION OF GOVERNMENT

1. Lessons Learned.

The organization of a competent non-Nazi Government, particularly at the Regierungsbezirk level and the reorganization of important functions such as the courts, police and food services could have been furthered if Special Branch teams charged with the responsibility of searching out and vetting proper German personnel and aiding Detachments in the organization of government had been available.

2. Conclusions.

A Special Branch team should be assigned to each Regierungsbezirk Detachment to assist and supervise in the organization of a non-Nazi competent government.

FINANCE

1. Lessons Learned.

a. Especially in occupied enemy territory it was desirable that constant visits be made to Detachments which too often had been transferred from other Army areas where non-uniform procedures had been employed.

b. In forward areas, where Military Government Officers were not functional specialists, inaction in the fields of Finance and Property Control would have been preferable, rather than the accidental measures often pursued.

c. In no countries entered was there found to be a shortage of currency though occasionally there was some maldistribution of existing stocks and shortages of bills of small denominations.

d. Advances of Military Government or Civil Affairs funds were not requested. The uses of such funds were restricted by directives requiring the exhaustion of all other procurement channels.

e. A satisfactory control of registered receipt vouchers could not be instituted at this Headquarters because of the constant shifting of Detachments. The accounting procedure for Military Government funds became a burden requiring a needless expenditure of time.

f. Banks, in general, were reopened within two to three weeks of their uncovering. Despite existing directives stressing the importance of the de-Nazification program, all Nazis or ardent sympathisers were not removed from positions of influence or trust in the German banking system.

2. Conclusions.

a. Transportation and personnel should be made available to permit frequent visits by staff functional officers to operating Detachments.

b. Forward Detachments should confine their financial activities to security measures.

c. Upon occupation of an area, immediate attention should be devoted to the proper distribution of existing stocks of indigenous currency.

d. A separate fund for the use of Military Government Detachments should not be provided. Arrangements should be made for turning in fines or abandoned currency to Army Finance Disbursing Sections.

e. Registered receipt vouchers should be controlled by higher headquarters such as European Civil Affairs Division. They should be issued initially in liberal quantities in order to obviate the necessity for Detachments to print up their own supplies with consequent loss of control of the system.

f. Constant checks should be conducted to see that programs for the elimination of undesirable personnel are carried out. Directives on this subject should be clear and specific.

ANNEXES

ANNEX NO. 1

MONUMENTS, FINE ARTS and ARCHIVES.

As of 1 August, 1944, when Third United States Army went operational, there was deployed from Supreme Headquarters, Allied Expeditionary Force Headquarters, a Monuments, Fine Arts and Archives officer on detached service with the G-5 Section.

An account of his activities follows:

Inspection visits were made during October to the United States St. Mihiel Cemetery 1914-1918 at THIAUCOURT (U-6442) and the Memorial Monument of the same battle at MONTSEC (U-7334). It was found that German soldiers had entered the cemetery and had broken down all the grave-markers bearing the Star of David. These were raised into place, dowelled and cemented in their bases. The memorial, situated at the crest of MONTSEC, which commands the countryside, had been used as a temporary fortress by a German infantry platoon. In ousting them, Third U.S. Army troops had used nothing heavier than fifty caliber machine guns, but many holes and spallings were found in stone columns and friese. The caretaker was summoned from a nearby village and set to work gathering fragments.

The cathedral of TOUL (U-61) was found closed because of the serious damage inflicted by vengeful German attacks in 1940. Only slight damage had occurred to it in liberation fighting, and to other monuments, such as the Eglise St. Gengoult, Porte de Metz, and the old houses along Rue Michatel. The many fine eighteenth century monuments of NANCY (U-81) were found intact. The Places Stanislaus and de la Carriere were being used as parking areas for military vehicles. In view of continued enemy shelling, the presence of these vehicles endangered the entire historical section of the city. At the request of this sub-section the Provost Marshal changed the parking area to a less important section. A nearby chateau de Fleville at LUDRES (U-9403) was evacuated by a Third U.S. Army unit, after a similar request, even though it had just finished ousting a German combat force from the chateau.

Operations were carried out in the southern part of the Department of MEURTHE-et-MOSELLE during November. At ST NICOLAS du PORT (U-9405) the great fifteenth century masterpiece of flamboyant architecture, Eglise St. Nicolas, still not fully restored after damage in 1917, had received more direct hits. The departmental architect for historical monuments and a contractor were taken to the site to plan for resumption of work as soon as possible.

The University of PONT-a-MOUSSON (U-7635), for two months between the opposing armies, was found in ruins. During the fifteenth and sixteenth centuries this had been the largest university in EUROPE with more than 3,000 students. It was decided to put a protective watershed over the still-standing exterior walls. Materials were located, their release obtained from Third U.S. Army Engineers, and trucks loaned to civil authorities to get them to the site. The necessary work was accomplished before severe cold weather set in. Temporary repairs were also carried out on other monuments of the town, notably Eglise St. Martin and Eglise St. Laurent. Neither of these churches had heavy damage.

Inspection was also made during November of Chateau de CRACN at HARAUCOURT (Z-4480) built in 1720 by Boffrand, the Memorial to Maurices Barres at the summit of the Hill of SION-VAUDEMONT (U-1464), the twelfth century church at MAVILLE (U-6340) and the Romanesque churches at LAITRE sous AMANCE (U-9431) and NOMENY (U-8234). All these monuments were posted for protection.

Inspections, photographs and reports were made of the historical monuments surrounding DOMREMY la PUCELLE (Z-4080), the birthplace of Jeanne d'Arc. Due to the rapid advance of Third U.S. Army troops during December the enemy was not able to make a stand in the area. It was found that as a consequence there was no war damage to the little house in which Jeanne was born, nor to the village church beside it. The costly new memorial Basilique also escaped untouched. These buildings were posted with signs reminding visiting soldiers of their historical significance and requesting respect.

The fifteenth to sixteenth century Chateau de BOURLEMONT at NEUFCHATEAU (Z-4975) had been occupied by German troops. A suspiciously loosed stone in the chapel floor was lifted out, giving access to the tombs below. Inspection revealed that a sixteenth century coffin had been opened and robbed of whatever wealth in jewels or costume ornaments it may have held. Considerable damage had been done to furnishings, paneling and wall decorations within the chateau. Notices were placed on the building to insure good maintenance if occupied by Allied troops.

Other inspections included the twelfth century Romanesque church at BERCOUVES (U-6410) and Chartreuse de BOSSERVILLE at BOSSERVILLE (U-9111). The foundations of this monastery were built from stone taken from the ancient walls at NANCY (U-81). The preliminary inspection was made at METZ (U-85) during December.

For the first time contact was made with the blundering activities of the German Government in its newly annexed territories. Seventh and eighth century manuscripts were found to have been removed from the historical archives of METZ (U-85) to Fort St. Quentin where two-thirds of them were burned in the German evacuation panic. The priceless Tresor of the Cathedral, including the Cloak of Charlemagne, had been carried off into GERMANY. Great stores of furniture sequestered from politically undesirable civilians were found in chateaux. Price tags were still on some of the heirlooms. More than eight hundred thousand seised books were found in the bomb-damaged Franciscan Monastery. Because of exposure to the January weather some were moved to other parts of the building. Valuable information for later operations was obtained from two German officials who were caught in METZ. First aid repairs were given to architectural masterpieces that had all been spared in Allied air-attacks, but were hit by German shelling during their long hold-out in the surrounding forts. Boarding and waterproof covering was put over the completely destroyed east window of the Chapelle du Sacre Coeur of the Cathedral. The former French director of the museums was returned from NANCY (U-81) to METZ (U-85).

At THIONVILLE (U-88) evidences of crude, uncertain policies were also found. French patriots had sent all of the city archives to the Charente in the south of FRANCE, but the Germans returned them to the cellars of the Hotel de Ville. They were found to have been destroyed by flood waters from the MOSELLE. Portunately photographic copies were found in the possession of a scholarly priest of a nearby town. First-aid repairs were started on the damaged ceiling of Eglise St. Maximus and the civil government was urged to make temporary repairs to Tour aux Puces, last remains of the thirteenth century chateau.

It was found during February that fighting in the northern part of the Grand Duchy of LUXEMBOURG and eastern BELGIUM had seriously damaged many buildings and sites on the Official List of Protected Monuments, Supreme Headquarters Allied Expeditionary Force. The Romanesque tower of Eglise St. Pierre at BASTOGNE (U-55) had been hit and badly shaken by concussion as had the rest of the church. The shattered main entrance was boarded up in order to protect valuable sculpture and furnishings in the church. Temporary waterproof coverings were put on broken windows and roof holes.

Grand Duchy of LUXEMBOURG villages along the German frontier were found deserted with no building escaping serious damage. At CLERVAUX (P-76) the restored twelfth century castle was found to be again in ruins, but the finest works of art were safe in the Chapel of Notre Dame de la Lorette. This chapel was placed under Civil Affairs protection, and its broken windows and roof were temporarily repaired. Representatives of this sub-section went into REMTFNACH (L-0536) with the Engineers who were to clear the still-smoking rubble from necessary highways. Fragments of the old town market-cross, town-hall sculpture, and wood carvings in the thirteenth century Parish Church were saved. The head of the Abbe Bertels statue was retrieved from the River SURE where it had fallen when the ancient bridge on which it stood was demolished by retreating Germans.

The eleventh century Priory Church of MONT SAINT MARTIN (P-5907), though internationally known as a fine example of Rhenish Romanesque architecture, was fired upon and damaged by the Germans in May 1940. As a result of the long period of dampness a small plaster spalling on the chancel wall indicated to members of this sub-section that a mural painting might have been covered over centuries ago. Removal of a larger area of the loose outer coating of plaster revealed a fourteenth century painting of the Annunciation. The local mayor, cure, and Civil Affairs Detachment were immediately notified of the discovery. Particulars were taken to PARIS (S-04) and complete restoration by experts arranged for. A copyist was sent to MONT SAINT MARTIN (P-5907) to record the walls for the national fresco museum, Palais de Chaillot, PARIS.

Operations in March covered that portion of the RHEIN PROVINZ centering around TRIER (L-22). Fighting in this area was found to have left many cultural institutions badly damaged, but the oldest ones, those of Roman times, had escaped. A civil commission was set up to save fragments, barricade destroyed doorways to prevent spoilation and to care for the collection of archives and works of art which were found to have escaped through intelligent dispersion outside of the city. Temporary covering was put over a large shrapnel hole in the roof of the great Baroque Paulinuskirche at TRIER.

A high German official in PARIS (S-04) during the occupation was found hiding in a small village near TRIER (L-22) in March. Through his cooperation enough fresh, authoritative information was obtained to design a plan for operation throughout the rest of the country. Location of depots of works of art and names of officials who were able and willing to cooperate were plotted on a map. Letters dealing with the complicated intrigue of German seizure of great private collections were found in his files. These were taken over, photographed and held for later study.

Books from the city libraries of BERLIN and DUSSELDORF (P-39) and the University of MARBURG were located at HATTORF (H-5350); this cache contained more than one million books. Another one hundred thousand books from the reference library of the German Foreign Office were found at GROSSENTAFT (H-5040). Eight large deposits full of Jewish books, archives and ritual objects were confiscated by the Germans in occupied countries, and placed in HUNGEN (U-8309), were placed under protection. Guards were placed upon materials from the BERLIN Prussian State art collections which had arrived at MERKERS (H-6850) just two days ahead of American troops. A military guard was also placed upon Schloss Veldenstein, the country home of Reichsmarschal Hermann Goring. In his haste to flee, early in the month, he left behind part of his fabulous collection of paintings, tapestries, sculpture, libraries and jewels.

During the period, 1 May to 8 May, this sub-section uncovered the important Kinsatzstab Rosenberg depots at Schloss COLMBERG (S-9488) and at Schloss KOGL, near ST. GEORGEN (V-2643). The former, a twelfth century castle, contained looted religious paintings from POLAND and RUSSIA. Schloss KOGL contained a considerable collection of paintings, furniture, bric-a-brac and books, mostly taken from French Jewish nationals by the Rosenberg organization. While there were some interesting paintings and good rugs, this was of secondary importance compared with other depots.

The greatest located art collection of all the Nazi takings was also uncovered in the same period. Following weeks of sifting scraps of information, and after three difficult days of tunneling through demolition barriers, the 600-year-old salt mine at ALT AUSEE (V-5212) yielded material intended for the so-called Fuehrer Museum to be constructed in LINZ (V-88), AUSTRIA, as a memorial to Hitler, after the war. In the mine were 6,577 paintings, 230 drawings and watercolors, 954 prints and engravings, 137 pieces of sculpture, 128 pieces of arms and armor, seventy-eight pieces of furniture, seventy-nine baskets of decorative arts, 484 cases, the contents of which are unknown, 122 tapestries, 181 cases of books, and between 1,200 and 1,700 other marked cases of books and periodicals.

The depot at ALT AUSEE (V-5212) formed the hub for twenty-one others of great importance. A provisional

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

Subject: After Action Report of the Adjutant General's Section.

To : Commanding General, Third U. S. Army, APO 403, U. S. Army.

1. There is submitted with this letter, the After Action Report of the Adjutant General's Section, Third U. S. Army Headquarters, beginning with 21 March 1944, and continuing at the designated intervals by chapters.

2. The history of the Adjutant General's Section during the operation "OVERLORD" is largely concerned with the organization and detailed operations of the Casualty Subsection, the Machine Records Unit, and the Army Postal Service. These activities have been selected for lengthy treatment for the reason that these are the sub-divisions of the Adjutant General's Section with functions most radically differing during operations from routine procedures in non-operational situations. The remainder of the Adjutant General's Section, consisting of Executive, Miscellaneous, and Personnel Subsections, functioned throughout the operation, both in method and tempo, in a manner most similar to the routine functioning of these activities in non-operational situations.

R. E. CUMMINGS,
Colonel, A. G. D.,
Adjutant General.

CHAPTER 1
PLANNING IN UNITED KINGDOM

SECTION I

GENERAL

Actual administrative planning for the "OVERLORD" operation was initiated by the Adjutant General's Section on 21 March 1944.

Previous operations had demonstrated that the normal peace time organization of an Army Adjutant General's Section was not adequate or suitable for combat operations. To function rapidly and efficiently in combat, certain sections required augmentation while other sections, such as Top Secret Control and Casualty, had to be created in order to handle those administrative matters peculiar only to combat.

The organization for both planning and operational phases, as finally adopted, is indicated in the chart on the preceding page.

It was not anticipated that the change-over from peace time operations to combat would materially affect the organization of the Miscellaneous and Personnel divisions. An increased volume of work was expected in the Cables and Distribution Sections and this was provided for by augmenting the sections with additional personnel. Provisions were also made to take care of the additional administrative work incident to Awards and Decorations and Battle Field Promotions and Appointments.

The highly secretive nature of the "OVERLORD" operation and its allied plans made it imperative that special measures be adopted for the processing and security of the voluminous amount of highly secretive documents, directives, and papers pertaining to these plans. Consequently, in compliance with instructions from Headquarters European Theater of Operations, a Top Secret Control Section was organized under the jurisdiction and supervision of the Adjutant General.

Security Memorandum No. 2 was issued by Third U. S. Army to all of its attached and assigned units on 26 March. This memorandum set forth the necessary regulations for the operation of the Top Secret Control Section, not only for Headquarters Third U. S. Army but also as a guide for all Third U. S. Army units.

According to this directive, The Adjutant General was designated Top Secret Control Officer for the Headquarters. Two officers and four enlisted men from the Adjutant General's Section were selected to operate the Top Secret Control Section. Each staff section of the Headquarters appointed two Assistant Top Secret Control Officers to be responsible for the handling of documents within its jurisdiction. Officers authorized to be fully informed of operational plans and others authorized to have only partial knowledge (designated "complete" and "limited" knowledge officers respectively) were appointed in each staff section in order that information relating to operational plans (such as "OVERLORD") and cover and deception plans, code names, destinations, dates, special equipment, target areas, and geographical locations would be limited to as few personnel as possible.

The office operated on a twenty-four hour basis as a "sealed room", under guard of Military Police. Entrance was given to designated officers and personnel approved by the Secretary to the General Staff upon the showing of a "Complete" knowledge card to the guard posted at the door.

The Top Secret Control Office cleared all incoming and outgoing correspondence which contained Top Secret information.

Documents were received, registered, distributed, dispatched, filed, and records maintained. Each document was logged in a Top Secret Control Journal and a record of its location noted in a Cardex file. A receipt file was carefully maintained so as to keep a record of all documents. Periodically an inventory of Top Secret documents was made in order to establish accountability.

Periodic reviews of documents originating in the Headquarters were made for the purpose of recommending the earliest possible downgrading. At no time during the operation of the Top Secret Control Office was a Top Secret document lost. The strictest adherence to security regulations was maintained.

Casualty Section — A Casualty Section was organized to process all Battle Casualty Reports expected during the operation. It was placed under the command of an officer obtained from the Seventh U. S. Army who had been in charge of battle casualty reporting in other organizations during two previous campaigns. This section originally consisted of two officers and eight enlisted men. Since battle casualty reporting is considered to be one of the most important functions of an Adjutant General's Section during combat, this subject is treated separately in Section II of this report.

Machine Records Unit — The Machine Records Unit in combat assumes additional duties and responsibilities. It is absolutely essential that accurate strength reports be furnished promptly to interested staff sections and tactical commanders. The processing of battle casualty reports must be rapidly and accurately handled so that casualty information can be furnished to the War Department and to relatives. The operation of a Machine Records Unit during rapid displacements forward and constant work under field conditions presents additional problems. All these are considered of sufficient importance to be treated under a separate Machine Records Unit sub-section.

Postal Section — During the planning phase, the Postal Officer was mainly concerned with determining the Theater policies and plans for postal operations, and with promulgating them to all Army units with certain modifications made to fit the Army tactical plan. Early request was made for sufficient army postal units to service the Army efficiently. One unit for each 10,000 troops was considered the minimum required. The postal service, because of its effect on morale, was considered of sufficient importance to warrant a separate section.

Past operations had shown that it was necessary to move administration to the rear to relieve subordinate commanders of administrative details during combat. It had been found impossible for front line troops to prepare essential administrative papers such as morning reports and casualty reports when actually engaged in combat. Consequently, a personnel administrative plan was prepared prescribing the organization and functions of Administration Centers and Control Sections in all divisions of the Army. The details of the plan as announced were as follows:

PERSONNEL ADMINISTRATION PLAN FOR THIRD U. S. ARMY

I. Purpose

1. To relieve Corps, Regimental, and other subordinate commanders of administrative details by moving administrative work to the rear, and,

2. To insure simplicity, accuracy, flexibility, speed, and uniformity in the preparation of personnel reports and records.

II. The Plan

1. An Administration Center will be established at each division rear echelon composed of the Unit Personnel Sections of all assigned or attached units. Supervision, control, and jurisdiction over this section will be the responsibility of the Division Adjutant General.

2. An Administrative Control Section will be established in the forward echelon of each division composed of a small control and liaison group from the Division Adjutant General's Section.

III. The Administration Center -- The functions of the Administration Center will be as follows:

1. Act as a clearing house for all personnel matters between units of the command and higher authority.

2. Supervise the work of the Unit Personnel Sections to insure accuracy, uniformity, and promptness in the preparation of records and reports.

3. Establish a system of control to insure that all Unit Personnel Section reports and returns are submitted when required.

4. Effect rapid distribution of directives and disseminate information to Unit Personnel Sections.

5. Maintain locator card files of all personnel of the command. (This will meet the "Directory Service" requirements of FM 12-105.)

6. Prepare prompt and accurate Battle Casualty Reports and Morning Reports.

7. Complete promptly and accurately the administrative procedures relative to Awards and Decorations and Battlefield Appointments and Promotions.

8. Maintain statistics and casualty status files for ready reference.

IV. The Administrative Control Section -- The functions of the Administrative Control Section will be to control the submission and disposition of summaries of morning report remarks in the following manner:

1. By having one or more officers and sufficient clerical personnel who are familiar with morning report control on duty at the division forward echelon.

2. By receiving from each organic and attached element of the division located in the forward area, a daily summary of morning report remarks on which a control will be maintained to insure that a summary is received from each unit for each morning report "Day".

3. By forwarding by the most expeditious means the daily summaries to the Administration Center.

4. By maintaining liaison with units under division control to secure the daily summary when none is received.

V. Procedure -- The following procedures in the application of this plan will obtain:

1. The Division Commander will have those units of his command which are located in the forward areas submit daily summaries of morning report remarks to the Division Administrative Control section where the control described in Section IV will be maintained. Units remaining in the division rear areas will submit their summaries direct to the Administration Center.

2. The Division Adjutant General will secure reports of admission and disposition from medical installations under division control, secure reports of stragglers and apprehensions from the Provost Marshal, reports of burial from Chaplains and Graves Registration personnel, and information on replacements. This information will be disseminated daily to the Unit Personnel Sections under his control.

3. From the information contained in the summaries of morning report remarks received from the units of the command, and from the information furnished by the Division Adjutant General, the Unit Personnel Officers will prepare battle casualty reports and morning reports. After check to insure accuracy of name spelling, serial number, and other pertinent information entered on these reports, they will be authenticated by the Unit Personnel Officer and forwarded to the Division Adjutant General for disposition as follows:

a. Morning reports to be forwarded to the Machine Records Unit servicing the division.

b. Battle casualty reports to be forwarded in duplicate to the Commanding General, Third U. S. Army, Attention: AG Casualty Division.

VI. Procedure for Corps and Army Troops.

1. Battle Casualty Reports of Corps Troops will be prepared in the Unit Personnel Sections and forwarded to this Headquarters through corps headquarters, where a control will be maintained to insure that reports are expedited. Machine Records Unit servicing corps will not process battle casualty reports.

2. Morning reports of Corps Troops will be forwarded daily by Unit Personnel Officers direct to the Machine Records Unit servicing the corps.

VII. Administration of Detachments -- Detachments, teams, and individuals operating in the combat area because of a specialty or special function will be attached to an organization under control of a division or corps for administration. Changes in status of personnel of this category will then be reported on the morning report of the organization to which attached.

The foregoing plan was issued on 12 April.

In order to make administration procedure uniform for all units of Third U. S. Army and to teach inexperienced personnel those

Digitized by Google

administrative matters -- especially casualty reporting -- necessary in combat and not taught during peace time or practiced on maneuvers, a series of administrative schools were organized. A schedule was prepared and corps commanders were notified to provide facilities for the schools. Administrative instructors with combat experience were detailed from the Third U. S. Army Staff to conduct the schools. All Unit Personnel Officers, Sergeants Major, and Personnel Sergeants Major from all corps and division units and army troops, and representatives from the Corps and Division G-1 and Adjutant General's Sections were required to attend. The school schedule was:

First Day

0900 - 0950	Introduction to school Responsibilities of administrative personnel The Personnel Administration Center and the Administrative Control Section
0950 - 1130	Battle Casualties and Battle Casualty Reports Reports of Non-battle Casualties
1130 - 1200	Discussion
1330 - 1500	The G-1 Report
1500 - 1600	Awards and Decorations
1600 - 1700	Discussion

Second Day

0900 - 1130	Personnel Records of Casualties; preparation and submission
1130 - 1200	Discussion
1330 - 1400	Personnel Replacement Procedures
1400 - 1500	Battlefield Appointments and Promotions
1500 - 1530	Reclassification, Reassignment, and Demotion of Officers
1530 - 1600	Prisoners of War and Graves Registration
1600 - 1700	Final Discussion Period

Nine schools were held and all corps and divisions (except one) and practically all corps and army troops units sent representatives to one or another of the schools. Attendance was as follows:

Units Represented	Location	Dates	Number of Attendants
5th Infantry Division XV Corps Troops	Newcastle, North Ireland	10 and 11 May	350
8th Infantry Division XV Corps Troops	Enniskillen, North Ireland	12 and 13 May	330
83d Infantry Division VIII Corps Troops Army Troops	Hanley, England	16 and 17 May	620
79th Infantry Division Army Troops	Warbury Hall, England	19 and 20 May	200
VIII Corps Troops Army Troops	Knutsford, England	22 and 23 May	310
9th Armored Division 28th Infantry Division XX Corps Troops Army Troops	Marlborough, England	26 and 27 May	440
4th Armored Division 6th Armored Division Army Troops 7th Armored Division (Advance Detachment)	Moreton-On-Marsh, England	29 and 30 May	480
35th Infantry Division	Tavistock, England	12 and 13 June	70
XII Corps Headquarters Army Troops	Stourport, England	15 June	600 3,400

SECTION II

CASUALTY SECTION

Upon assignment to the Adjutant General's Section of an officer from the Seventh U. S. Army who had been in charge of casualty reporting in two previous operations, a study was immediately initiated on casualty reporting procedures in effect in the Theater on which the Third U. S. Army casualty reporting system would be based.

Battle casualty reporting is not taught during peace time nor practiced on maneuvers. Plans had to provide for teaching this important subject to the troops and to include the preparation of a complete reference guide that would answer all questions concerning casualties for all personnel responsible for these reports.

The reference guide was prepared, and after approval by the European Theater of Operations, was published on 2 May as Circular No. 8, Headquarters Third U. S. Army. In scope, this circular embraced the entire field of casualty reporting and allied matters. Although too lengthy for reproduction in its entirety here (forty-two pages), it was issued because it had been found that inexperienced troops particularly needed a complete document quickly giving the answers to all questions concerning casualties without the necessity of referring to numerous circulars, directives, and memorandums issued by Army and higher headquarters and generally found to be not at hand when needed.

Section I, Circular No. 8, covered battle casualty reports. Because of general unfamiliarity with this subject, Section I is quoted in its entirety in the following paragraph. For convenience, quotation marks are omitted.

* * * *

1. Purpose. Battle Casualty Reports, ETO-Cas Form 1, are rendered for the purpose of providing the War Department with complete and accurate data regarding casualties which occur as a result of enemy action. Wounded Progress Reports, ETO-Cas Forms 3, are rendered for the purpose of providing the War Department with the progress and ultimate recovery or death of wounded and injured personnel previously reported. From the information contained in these two reports, the War Department notifies the next of kin or emergency addressee of the fact of the casualty and the progress of wounded and injured.

2. Definitions of Battle Casualties.

a. Injury or death is due to enemy action when incurred as a direct result of engagement with an enemy force, or as a direct result of enemy action during an engagement or otherwise; when an injury or death occurs while immediately engaged in, going to, or returning from a combat mission, whether or not due directly to enemy action; when injury or death is the result of any act of the United States or Allied Forces while engaging the enemy. Battle casualties are divided into the following types:

(1) Killed in action.
(2) Died as result of wounds received in action.
(3) Died as result of injuries received in action.
(4) Seriously wounded in action.
(5) Seriously injured in action.
(6) Slightly wounded in action (requiring hospitalization over 24 hours).
(7) Slightly injured in action (requiring hospitalization over 24 hours).
(8) Missing in action.
(9) Captured as a result of enemy action.
(10) Interned in a neutral country as a result of enemy action.
(11) Seriously ill, gas casualty.

b. Killed in action. Individuals will be reported "Killed in Action" only in those cases where there is reasonably conclusive evidence of death or where there are circumstances that lead to no other logical conclusion. Where evidence of death is lacking, the individual will be reported "Missing in Action".

(1) When a date of death is to be reported under circumstances permitting the selection of date or when death has been confirmed but the exact date of death is unknown, the organization commander who is in a position to have or secure records bearing on the case, will select the date on which death could reasonably be presumed to have occurred, consistent with the circumstances, which will be used as official on all records.

c. Wounded or Injured in Action. Wounded or injured in action casualties are those resulting from the piercing of the body by a projectile, a fragment or shell or bomb, an object set in motion by enemy weapons or by weapons of the United States or Allied Forces while engaging the enemy, the piercing of the body by any weapons in the hands of, hurled or thrown by the enemy, torn flesh or broken bones received from a moving object propelled directly or indirectly by the United States or Allied Forces while engaging the enemy, any disabling contact with gas or flames released or propelled by the enemy, or by the United States or Allied Forces while engaging the enemy. Wounds or injuries sustained by paratroopers jumping from aircraft on a combat mission will be classified as "Wounded in Action" or "Injured in Action." "Injured in Action" casualties, as distinguished from "Wounded in Action," are abrasions, sprains, fractures, lacerations, concussions, frost-bite, etc., which are incurred while going to, returning from, or during a combat mission. In those cases where a wound as well as an injury is present, the casualty will be classified and reported as "Wounded in Action." Psychoneuroses and mental diseases developing under battle conditions, commonly but improperly designated "battle neurosis," "anxiety," "hysteria," "shell-shock," etc., will not be classified as battle casualties nor reported on Battle Casualty Reports.

(1) The decision as to whether or not a wound or injury was incurred in action and whether or not the case should be classified as a battle casualty rests with the commander concerned.
(2) All concerned will be on the alert to detect malingering or self-inflicted wounds and to prevent such cases from being reported on battle casualty reports.

d. "Missing in Action," as distinguished from "Missing" (See paragraph 15b, Section II, this circular) are those known to have engaged the enemy on land, on the sea, or in the air, and who are not accounted for after termination of the engagement, flight, or voyage. Personnel will be reported "Missing in Action" and dropped by organizations after a minimum of seventy-two (72) hours from the establishment of the absence. During this period, every effort will be made to secure further information or locate the individual. If, after a report of "Missing in Action" has been made, further information discloses that the person so reported is dead, wounded, injured, or in a different status, a "corrected" Battle Casualty Report will be submitted promptly.

e. Captured by the enemy casualties are those positively known to have fallen into the hands of the enemy. Casualties believed to have fallen into the hands of the enemy, but without positive proof thereof, will be reported "MIA."

f. Interned casualties are those detained by a foreign government under international law. There are two types of "Interned" casualties, "Battle" and "Non-battle." Internments caused by enemy action are "Battle" casualties and will be reported on Battle Casualty Reports. Internments from any other cause are "Non-battle" casualties. Instructions for reporting "Non-battle" casualties are contained in paragraph 15, Section II, of this circular.

3. Notification of Next of Kin and Releases to the Press.

a. Notification to Emergency Addressee and Next of Kin will be made only by The Adjutant General, War Department, Washington 25, D. C., based on official casualty reports rendered through this Headquarters. No other notification as such will be made direct by commanders or others in this command except when the emergency addressee or next of kin resides within the theater. The notification will then be made by the Theater Commander, acting for the War Department.

b. When commanders, chaplains, or personnel officers desire to send letters of sympathy, such letters will be prepared in triplicate and forwarded to this Headquarters, through channels, [illegible] envelope addressed to the emergency addressee. [illegible] will be taken in regard to the [illegible]

DECLASSIFIED
DECLASSIFIED
Digitized by Google

(1) That the full name and serial number of the casualty is stated,
(2) That the letter contains the same categorical description of the casualty as does the official casualty report,
(3) That the letter does not magnify the subject's condition and does not indicate that there is or is not the possibility of return to duty,
(4) That security and censorship regulations are strictly observed, and that information regarding the location of graves, disposal of remains and effects, photographs of graves are not included or inclosed, and,
(5) That whom letters of inquiry from relatives and other interested parties are answered, the writer has assured himself that an official casualty report has been rendered, and that letters so written are forwarded through channels.

c. In no case will casualty information be released, outside of official casualty reports, until thirty (30) days have elapsed since the rendition of an official report.

4. When submitted. Battle Casualty Reports will be submitted as expeditiously as possible after casualty occurs. reports on wounded and injured will not be delayed pending the investigation of other types of casualties. In no event will accuracy be sacrificed for speed.

5. Security Classification. Battle Casualty Reports and correspondence relating thereto will be classified "CONFIDENTIAL."

6. Preparation.

a. By Whom Rendered. Battle Casualty Reports will be prepared by regiments, separate battalions, companies, detachments, and similar units. These reports will be prepared in the Administration Centers of divisions for all troops assigned or attached to the division, and in the Unit Personnel Sections of corps and army troops. (See Circular 3, this Headquarters).

b. Accuracy. Accuracy is essential in the preparation of Battle Casualty Reports. It is inexcusable to report erroneously an individual killed. Names and serial numbers must be carefully checked and verified to insure that correct identity is established. Reports must be clear and legibly prepared. All sources of information and verification must be used to insure that the correct casualty status is reported. The authentication of a report by the Unit Personnel Officer or his representative is a certification that name spellings, army serial numbers, etc., have been checked and verified with personnel records.

c. Form to be used. Battle Casualty Reports will be rendered on ETO-Cas Form 1 only. This form will be supplied to units upon requisition, but in the event they are not available, they may be reproduced.

d. Information required.

(1) Organization. The official organization number or title designated by the War Department will be used, e.g. 17th Inf., 4th Inf., 3d Bomb Gp., etc. Combat teams, landing groups, shipment numbers, force numbers and codes will not be given as the organization on Battle Casualty Reports. Reports may be consolidated by parent units and one complete report forwarded daily.
(2) Army Serial Number. Must agree with that shown on service or other personnel records.
(3) Name. Full name and middle initial, if any, must be shown thus: "Smith, John P." or "Smith, John (NMI)," or "Smith, J. P. (IO)." Officers, warrant officers, and enlisted men will be reported on the same report regardless of grade or type of casualty. Names need not be arranged alphabetically.
(4) Grade. Grade must agree with that shown on Service Record and/or other personnel records on date of casualty.
(5) Arm or Service. The arm or service of each casualty will be entered in the "Arm or Service" column, i.e., "Inf," "AC," "FA," etc. Where the arm or service of all casualties appearing on the report is the same, one remark may be entered to indicate the fact, i.e. "All CAC," "All FA," etc.
(6) Type of Casualty Codes.

KIA - Killed in Action.
DOW - Died of Wounds received in Action.
DOI - Died of Injuries received in Action.
SWA - Seriously Wounded in Action.
SIA - Seriously Injured in Action.
LWA - Slightly Wounded in Action. (Hospitalized)
LIA - Slightly Injured in Action. (Hospitalized)
MIA - Missing in Action.
SIC - Seriously ill, gassed. (Hospitalized)
CAP - Captured by the Enemy.
INT - Interned as a result of Enemy Action.
RTD - Returned to duty from a previously reported casualty status.
ALW - Alive and Well.

(7) Date of Casualty. Show dates as follows: "6 Feb 44," "IC Oct 44."
(8) Flying or Jump Status. A separate column will be used on ETO-Cas Form 1 which indicates the flying or jump status of all casualties. Under no circumstances will this coded information be entered in the "Type of Casualty" column. In the case of ground forces and paratroops, one remark may be entered on the face of the form thus: "All not on flying or jump status," or "All qualified paratroops on jump status." The following codes will be used:

A - Pilot, Co-pilot, Command Pilot
B - Navigator
C - Bombardier
D - Observer
E - Flight Surgeon
F - Photographer
G - Radio Operator Gunner
H - Engineer Gunner
I - Armorer Gunner
J - Qualified paratroops on jump status
K - Gunner
L - All others on flying or jump status not included above
Z - Not on flying or jump status

(9) Place of Casualty. Show the territory, country or state where the casualty occurred. If all casualties on the report occurred in the same place, enter one remark, thus: "All casualties occurred Tunisia."
(10) Race. Casualties other than "White" will be so indicated after the name.
(11) When the emergency address of a casualty resides in the theater, the casualty report will include the emergency addressee's name, address, and relationship, in parenthesis, on the line following the name of the casualty.
(12) BCK Control Numbers will be assigned to reports by this Headquarters. Units will make no entry in the space indicated "BCK CONTROL NO._____" on ETO-Cas Form 1.
(13) Under column headed "MOS", the correct military occupational specialty code for enlisted men will be entered from WD AGO Form 20, Qualification Card (AR 615-26, as amended). For officers, the codes listed in TM's 12-406 and 12-407 will be used without the organizational level fifth digit, i.e. 1542, 1034, 1203. Entries on WD AGO Forms 20 and 66-1 must be kept current in this respect.

e. Authentication. All Battle Casualty Reports will be signed by an officer or warrant officer whose name, grade, and title will be legibly stamped, typed, or printed under the signature.

f. Date. Each Battle Casualty Report will be dated.

g. Copies Required. The original and duplicate copy will be forwarded to this Headquarters, both copies will be signed. Sufficient copies will be prepared so that one may be retained at each Headquarters through which the report passes.

h. Non-battle Casualties, i.e., normal illness or accidental injury, deserts, missing or interned non-battle casualties will not be reported on Battle Casualty Reports. See paragraph 13, Section II, this circular.

i. Separate Reports. U. S. Army battle casualties and casualties of the several U. S. and Allied military and naval services will be listed on separate reports. The services concerned will be clearly typed or printed in bold characters on the first line of the report, thus: "U. S. Marine Corps," "Royal Navy," etc.

j. Wounds and Injuries not Reported. Light wounds, injuries, and gas casualties that do not require hospitalization for more than 24 hours will not be reported on Battle Casualty Reports. This in no way affects the right of the individual to a Purple Heart award for wounds received in action. All wounds received in action, however slight, that require medical attention, will be recorded in the service record of enlisted men and on WD AGO Form 66-1 for officers or warrant officers.

k. Classification of Wounds and Injuries. Wounds and injuries will be carefully classified as "Slight" or "Serious." Previous reports indicate that many wounds are incorrectly classified. Many individuals have died of reported "Slight" wounds and other individuals who were reported "Seriously wounded" have been reported as returned to duty within a few days after the initial report. Wounds and injuries will not be reported as "Serious" unless the gravity of the wound or injury imperils the life of the individual or indicates permanent disability.

l. Corrected Reports. When it is discovered that an erroneous casualty report has been rendered, a correction must be submitted immediately. Previous report will not be corrected by retyping the entire original report minus the names of those erroneously reported and labeling it a "CORRECTED" report. Battle Casualty Reports will be corrected or amended by the procedure used to correct an erroneous entry in the Morning Report. The name of the individual whose status is to be corrected will be included with other initial casualties, with a remark after or on the line below his name showing the change in casualty status. Examples: "From MIA to RTD," "From MIA to KIA," "From SIA to DOI," "From SWA to LWA," "Correcting date of casualty from MIA 2 May to MIA 3 May 43," etc. Enter in the "Date of Casualty" column, the date of the new or corrected status. Corrections to previously submitted Battle Casualty Reports will be made on ETO-Cas Form 1 only. If letters of explanation are necessary, they will be securely stapled to the report, arranged so that the Form 1 is on top.

m. Returns to Duty. Personnel returned to a duty status with any organization, including replacement installations, from a previously reported battle casualty status, will be reported on Battle Casualty Reports. Separate reports are not required; names may be included with other initial reports of battle casualties. The code to be used in the "Type of Casualty" column will be "RTD" and "Date of Casualty" column, will show the date soldier returned to a duty status. The effective "Date of Casualty" for escaped prisoners of war and interned personnel will be the date the individual first returned to allied military control.

n. Reports on Personnel of other Units. Individuals attached to and carried on the morning report of the reporting organization will be included on the Battle Casualty Report of the organization when they become casualties while serving with that organization. Commanders having knowledge of casualties from other organizations will furnish the commanders thereof, in writing, all information available. A copy of such notification will be forwarded to the next higher headquarters.

o. Check and Consolidation. Battle Casualty Reports will not be consolidated beyond the regiment. Each Division Headquarters must maintain a file of battle casualties reported through their headquarters. All sources of casualty information such as Reports of Burial, Admission and Disposition Reports from hospitals and other medical installations, and reports of stragglers, apprehensions and shootings will be checked against this file to prevent an individual from being reported as "Missing in Action" where a parallel report reveals a different status.

p. Battle Casualty Reports rendered by Hospitals. Commanders of hospitals assigned or attached to this command will submit Battle Casualty Reports, ETO-Cas Form 1, on personnel of the hospital, the Detachment of Patients, and on other personnel, not members of the Detachment of Patients, when such personnel become casualties while

Digitized by Google

DECLASSIFIED

undergoing treatment at the hospital. In the latter case, the hospital commander will furnish copies of Battle Casualty Reports to the individual's organization commanders.

7. Routing of Battle Casualty Reports.

a. Unit Personnel Sections and Administration Centers will secure accurate casualty information from unit commanders and prepare typewritten reports.

b. Attached units will forward Battle Casualty Reports through the headquarters to which attached except that U. S. Army troops, attached to Allied forces, will forward Battle Casualty Reports through the headquarters to which assigned.

c. Battle Casualty Reports prepared in the Administration Centers of Divisions will be forwarded by Division Adjutants General daily for all assigned and attached troops. Reports will be forwarded direct to this Headquarters marked for the attention of the AG Casualty Division.

d. Battle Casualty Reports prepared in the Unit Personnel Sections of Corps troops will be forwarded to this Headquarters, addressed as above, through the Corps Headquarters to which assigned or attached.

e. Battle Casualty Reports of Army troops will be forwarded direct to this Headquarters by Unit Personnel Officers.

f. All reports forwarded to this Headquarters will be in duplicate.

8. Action Taken at Army Headquarters. The Army Machine Records Unit will maintain a set of Casualty cards from which any type of casualty statistic or tabulation, based on the information contained in the Battle Casualty Report, can be quickly reproduced on request. A reproduced set of Battle Casualty cards will be forwarded daily to each Corps Machine Records Unit for the purpose of furnishing casualty data requested by organizations serviced by that Machine Records Unit.

9. Hospital Reports. The provisions of Paragraph 11d, ETOUSA, Circular 46, dated 22 April 1944, concerning the preparation of reports by medical installations, will govern, except that reports prepared by units of this command will be submitted in accordance with the following supplementary instructions.

a. Immediate Action Letters. The commander of each active U. S. Army hospital will submit an immediate report where the condition of any non-battle casualty patient, who is a member of the U. S. Army, or a non-military person accompanying or serving with the Army of the United States, is such that recovery is questionable and notification should be made to the next of kin. Reports will be classified "CONFIDENTIAL" and rendered by radio or teletype if facilities permit. When such facilities are not available, the report will be submitted in letter form conspicuously marked "IMMEDIATE ACTION," and dispatched by the most expeditious means available, to this Headquarters, addressed to the attention of the AG CASUALTY DIVISION.

(1) In preparing reports, information regarding the full name, grade, serial number, organization, name of reporting installation, and date of admission, diagnosis, circumstances surrounding casualty if accidental, and condition, i.e., seriously or dangerously ill or injured. Reports may contain any number of individuals. An example of a radio report follows: "ROBERT L JONES MAJOR 0967894 NINETEENTH ENGR BN ADMITTED 8 EVAC HOSP 11 JULY 44 SUFFERING FROM FRACTURES AND INTERNAL INJURIES ACCIDENTLY INCURRED AUTO ACCIDENT SERIOUSLY INJURED," or "JAMES M GOODLAND SGT 34,364,578 79 RECON SQUADRON ADMITTED 87 STATION HOSPITAL 11 OCT 44 PNEUMONIA DANGEROUSLY ILL."

(2) After such initial report has been made, the individual will be carried as seriously or dangerously ill or injured until dropped on the Daily Disposition Report, ETO-Cas Form 4.

(3) When an individual who has once been reported as seriously or dangerously ill or injured is transferred to another hospital, a statement will accompany him with other medical records giving his casualty status, "Battle" or "Non-battle" and a resume of any reports rendered. The commander of the hospital to which evacuated will then pick up and report the [illegible] or disposition of the individual.

b. Daily Disposition Report, ETO-Cas Form 4. This report will be rendered on all PATIENTS ("DOUBLE" [illegible]) are dropped by a hospital under one of the categories listed on the reverse of ETO-Cas Form 4. On all evacuations and transfers, destination and hospital will be indicated if known.

(1) Daily Disposition Reports prepared by hospitals of this command will be forwarded in triplicate to this Headquarters addressed to the attention of the AG CASUALTY DIVISION.

c. Progress Reports, ETO-Cas Form 3. This form will be prepared on all BATTLE casualties [illegible] as of midnight of the last day of each reporting period. Reports will be submitted on the 10th and 25th of each month, and the periods covered by the reports will be as follows:

(1) Report submitted the 10th of the month--from 0001 hours 25th day of the month to 2400 hours the 9th day of the reporting month.

(2) Report submitted the 25th day of the month--from 0001 hours on the 10th day of the month to 2400 hours on the 24th day of the month.

d. The following will govern in connection with the preparation of these reports:

(1) Progress of casualty will be reported by one of the symbols listed on the reverse of ETO-Cas Form 3.

(2) Initial reports will be submitted by all newly activated hospitals or hospitals newly arrived in the theater.

(3) Negative reports will be submitted by all active hospitals in appropriate cases.

(4) Final reports will be submitted when hospitals are inactivated or leave the theater. Remarks will show date of inactivation or departure and status or disposition of patients.

(5) Cases in which type (battle or non-battle) of casualty is questionable or undetermined will be reported.

(6) Redesignated hospitals will show both old and new designation on the first report submitted subsequent to the date of redesignation.

(7) Evacuation hospitals will report only return to duty cases, deaths, those admitted dead, evacuations to another theater or direct to the United States, and the progress of those casualties present at the expiration of each report period who have been retained over ten days.

(8) All reports prepared by Hospitals assigned or attached to this command will be forwarded through channels to this Headquarters marked for the attention of the AG CASUALTY DIVISION.

e. Check and Consolidation. At each administrative headquarters through which the Daily Disposition Report or the Progress Report passes, the names entered thereon will be checked against casualty files to insure that all battle casualties have been reported on official Battle Casualty Reports, ETO-Cas Form 1.

10. Allied and Enemy Dead. Casualty Reports on allied and enemy dead will be rendered in accordance with the following instructions:

a. Casualty Reports on U. S. Navy, Marine Corps, and Coast Guard personnel will be forwarded by the unit preparing the report direct to the Staff Medical Officer, COMNAVEAU, LONDON. Casualty Reports on allied army personnel will be forwarded direct to the agency previously designated by such allied army. If correct agency cannot be ascertained, such reports will be forwarded to the CG, ETOUSA, APO 887, "Attention: AG Casualty Division."

b. Casualty reports on enemy dead will be made on Graves Registration Form 1 only. This form, prepared in quadruplicate, [illegible] all pertinent data and including nationality will be forwarded to the nearest Graves Registration Unit together with the personal property of enemy dead until delivery to the Graves Registration Unit. [illegible] including money and duplicate identification tag. Care will be [illegible] to avoid separating Graves Registration Form 1 from the personal

This is the end of Section I, Circular No. 8.

Sections II to IX of this circular dealt with allied matters usually covered in Army Regulations and other directives of general availability. These sections are synopsized below to show the scope of instructions desired to be issued on battle casualty reporting.

SECTION II -- Reports on Non-battle Casualties -- Deceased, Missing, Interned -- (Definitions of non-battle casualties -- Reports to be rendered -- Non-battle deaths -- Missing or interned personnel -- Statements surrounding disappearance of missing personnel -- Reports required on non-military personnel.)

SECTION III -- Settlement of Pay Accounts of Casualties -- (Action taken on deaths -- Duties of commanding officer -- Duties of disbursing officer -- Action taken on casualties other than deaths -- Duties of commanding officer -- Duties of disbursing officer.)

SECTION IV -- Preparation and submission of Personnel Records -- (Records of enlisted men -- Records of officers -- Preparation of final statement -- Entry of medals, decorations, and citations on records -- Check list of common errors -- Letters of condolence.)

SECTION V -- Disposition of Effects -- (Deceased and missing in action -- Sick and wounded -- Deserters -- Unknown owners -- U. S. Navy and British military and Naval personnel -- Enemy.)

SECTION VI -- Casualty Mail -- (Action by organization commander upon receipt of mail addressed to men who have been listed as casualties -- Differentiation between first class mail and second, third, and fourth class mail -- Mail not bearing return address.)

SECTION VII -- Army Burials and Graves Registration -- (Designation of unit graves registration officers -- Responsibilities of company commander -- Burial reports.)

SECTION VIII -- Reports of Investigation -- Deaths and Injuries -- (Deaths -- When post mortem examination and coroner's inquest held -- Disposition of reports of investigation -- Injuries -- Evidence required -- Disposition of reports.)

SECTION IX -- Disposition of Hospitalized Personnel -- (Transfer of individuals from units -- Morning report entry -- Disposition of individuals by hospitals -- Action taken when returnees from hospital create overstrength.)

The Administration Schools which were held during the period 10 May - 15 June were utilized to the fullest extent to familiarize all administrative personnel of Third U. S. Army with the details and importance of casualty reporting. The schedule and scope of these schools were given in Section I, Chapter 1, of this report.

It had been the experience of the Seventh U. S. Army in Sicily and the Fifth U. S. Army in Italy that, due to the frequent moves of Corps Headquarters and the frequent transfers of Divisions between Army Corps, the processing of casualty reports thru Corps Machine Records Unit resulted in unnecessary delay. Authority was obtained from the Theater Commander to establish Army Headquarters as the central processing and control agency for casualty reporting.

Coordination of all agencies from which casualty information was available was effected and necessary action taken to insure:

That hospitals would furnish this Headquarters information regarding casualties received and disposition by name, date, and diagnosis.

That prompt and accurate information would be received from the Army Graves Registration service regarding burials; and

Digitized by Google

That a system of transmission of casualty reports pertaining to units and a system of dissemination of casualty information relating thereto would be established to insure more rapid delivery than normal message center facilities provided.

Admission and Disposition Reports (a copy is attached as Annex 1) were prescribed for preparation by all medical installations and submission daily.

Coordination with the Army Graves Registration Officer insured that Reports of Burial required by the Casualty Section would be received as promptly as possible after burial, and that every effort would be made to complete the report in all details.

Plans were made for the establishment of a courier system to be adopted at the beginning of operations.

After issuance of the directive, completion of schools, and final coordination of associated activities and agencies, internal training of the Casualty Section began. Only two officers and eight enlisted men could be made available for training during this phase because the Army Headquarters Tables of Organization made no provisions for a Casualty Section, and no allowance of personnel therefor.

After attachment of the French 2d Armored Division to Third U. S. Army for operation, plans were expanded to include instructions and procedures for the processing of French Army casualties. On 9 June, after several conferences with staff officers from the French Division, a directive was issued by this Headquarters which contained substantially the following provisions with reference to battle casualty reporting:

Battle Casualty Reports were to be submitted to this Headquarters on a special form meeting the needs of both the French authorities and the Adjutant General's Casualty Section.

Reports were to be submitted as promptly as possible after occurrence of casualty and every effort was to be made to insure that the report was complete and accurate and that all available sources of information, such as reports from the medical battalion showing battle casualties being treated, Reports of Burial from the Chef D'Etat Civile, and any other available information were checked to insure accuracy. A death certificate (French, Acte de Deces) would be prepared in each case of death within the division and a carbon copy thereof forwarded to the Adjutant General's Casualty Section. In reciprocity, all American hospitals were required to complete the French Acte de Deces form wherever a member of the French 2d Armored Division died in an American hospital, the original copy of this certificate to be submitted to Headquarters, French 2d Armored Division for the Chef D'Etat Civile, and a carbon copy to the Adjutant General's Casualty Section, Headquarters Third U. S. Army.

Burials of American dead made by the French 2d Armored Division were to be reported to this Headquarters by name, grade, serial number, organization if known, date of death, and date and place of burial. Reports were to show cause of death, if known.

Wounded Progress Reports were to be prepared by Third U. S. Army hospitals on personnel of the French 2d Armored Division hospitalized for wounds or injuries received in action and submitted to the higher agency of the French Army charged with notifying the next of kin of the progress of those wounded in action. Copies of these reports were to be furnished to the French 2d Armored Division.

An officer and two enlisted men of the French 2d Armored Division were to be placed on duty in the Casualty Section at this Headquarters to process and coordinate reports of French casualties. At least one of the three individuals so detailed was to be able to speak English.

To assure uniformity in reporting, definitions of categories of casualties published in Section I, Circular No. 8, (quoted above) were to be observed by the French 2d Armored Division.

Planning was now considered complete. Although the equipment and personnel was still insufficient, upon movement of the Third U. S. Army Rear Echelon to the Staging Area, the Casualty Section was prepared for its mission.

SECTION III

MACHINE RECORDS UNIT

Prior to 26 March (when the 39th Machine Records Unit was assigned to Third U. S. Army), the European Theater of Operations had developed the General Machine Records System that would be adopted in all Corps and Armies operating in this Theater. The general system prescribed the assignment of a machine records unit to each Army and Corps Headquarters, provided that certain routine reports would regularly be rendered, prescribed the distribution of such reports, and outlined the channels for procurement of machine records supplies, spare parts, and equipment.

The 39th Machine Records Unit arrived at Toft Camp on 1 April and immediately busied itself in rounding out the organization of the unit in preparation for field operations, in obtaining supplemental equipment that would be required, and in developing special reports that would be helpful to Third U. S. Army Staff in the forthcoming operation as well as in coordinating the detailed plan of machine records administration within units of the Army.

The following special reports were developed to facilitate the work of the General and Special Staffs in planning movements of troops, requisitioning filler and replacement personnel, and obtaining necessary supplies and equipment:

Weekly Strength Returns of all Third U. S. Army Units.

Weekly Station List with daily changes thereto.

Inventory of Specialists in tabulation form.

Listing of Unit Serial Numbers assigned to each sub-unit.

Alphabetical listing of officers assigned to Third U. S. Army.

Suspect Report for G-2 Section showing names, locations, descriptions, and type of suspect (dangerous, suspect, unclassified.)

In addition to the above special reports, the following routine operations were carried on:

Daily changes to the organization master file were prepared and forwarded daily to Central Machine Records Unit, European Theater of Operations.

Weekly strength cards, W.D., A.G.O. Form 519 were prepared and forwarded to Central Machine Records Unit, European Theater of Operations, on the 7th, 14th, 21st, and last day of each month.

Monthly strength cards, W.D., A.G.O. Form No. 320 were prepared and forwarded to the War Department through Central Machine Records Unit, European Theater of Operations.

Monthly reports of absentees without leave were prepared for the Theater Provost Marshal.

Locator cards on units newly gained from the United States were prepared for Base and Army Post Offices.

Monthly officer personnel rosters were prepared and forwarded to the War Department.

Monthly enlisted personnel rosters for all Units assigned or attached to Third U. S. Army were prepared.

Embarkation rosters were produced for units embarking for movement to the Continent.

Officers status file was reproduced each month for Central Machine Records Unit, European Theater of Operations.

It was foreseen that the forthcoming operation would be one of extreme fluidity in which the frequent displacement of headquarters elements over long distances would be necessary. To prevent the suspension of operations within Machine Records Units for excessive periods during such movements, it was considered highly desirable to provide additional transportation, the minimum necessary being one tractor-truck for each semi-trailer van, plus sufficient auxiliary transportation to enable the unit to move without shuttling. This transportation was obtained for the 39th Machine Records Unit during this period.

Because of the close relationship between the Casualty Section and the Machine Records Unit (growing from the inter-dependence of their work), it was planned to merge these groups for movement and operations. In order to lend sufficient flexibility to the Machine Records and Casualty groupment to enable it to operate independently of the remainder of the Adjutant General's Section both as to distance and as to time schedule, it was planned to provide a separate mess to be operated by the 39th Machine Records Unit.

It was apparent that Machine Records Units would occupy a vital place in battle casualty reporting during operations, and much attention was given to planning Machine Records participation in the battle casualty reporting system. As finally approved for Third U. S. Army, the plan required that battle casualty reports be first checked by the Third U. S. Army Battle Casualty Section to assure accuracy, and then submitted to the Machine Records Unit, which would produce battle casualty cards for transmission to Theater Headquarters. In processing battle casualty reports, the Army Headquarters Machine Records Unit was charged with the task of processing reports of all troops of Third U.S. Army, including divisions. It was a vital part of the system that Corps Machine Records Units should be prevented from processing battle casualty reports on their way backward from fighting units to Army Headquarters.

The plan required that completed battle casualty reports be in the form of International Business Machines' punch cards. Since the report was required in quintuple, five decks of such cards were to be produced by the Army Headquarters Machine Records Unit; three decks to be mailed immediately to Theater Headquarters, one deck retained for files in the Machine Records Unit, and the fifth deck to be sorted by corps and transmitted to Corps Machine Records Units for mechanical processing against corps status files to maintain such files in current condition and to detect any errors that might exist in the Battle Casualty Report.

Attachment of the French 2d Armored Division raised the question of machine records services to troop units of armies of Allied Nations when such units were operationally attached to our forces. It was felt that records of individual soldiers of Allied Nations would have no operational value, but that strength returns of organizations in this category would be necessary for operational purposes. Consequently, it was decided that status files for troops in this classification would not be maintained, but that special strength returns would be submitted from which Machine Records Units would be able to compile the necessary consolidated returns. To implement this decision, the following directive was issued on 9 June to the Commanding General, French 2d Armored Division:

"Machine Records Requirements

"A daily report . . . will be submitted to the Commanding General, XII Corps, attention: 14th Machine Records Unit (M), showing the strength and location of each Brigade, Regiment, Battalion, separate Company and separate Detachment.

"The report will show the strength of each separate organization as follows:

Number of officers assigned and present for duty.
Number of officers assigned but absent, i.e., on leave, sick in hospital, assigned not yet joined, and otherwise not present.
Total number of officers present and absent.
Number of enlisted men, including non-commissioned officers, assigned but absent, i.e., on leave, sick in hospital, assigned not yet joined, and otherwise not present.
Total number of enlisted men, including non-commissioned officers, present and absent.

"Locations will be entered below the name of each organization and will give the name of the town and map coordinates in two places alphabetically and four places numerically. British Grid System will be used. In the event the organization is not in a town, reference may be made to the distance from the nearest town, i.e., Glasgow, five (5) Kilm West Of LL85."

Digitized by Google

Postal plans for Continental operations provided for the location of one Postal Regulating Section at each of the two principal debarkation points and one for each Army. In addition to their normal duties, these shore installations were to perform Base Post Office functions until a Base Post Office was established on the Continent. Incoming mail destined for the Continent was to be cleared through the Base Post Office in the United Kingdom and dispatched to "Red" or "Black", as the two beachheads were designated. Outgoing mail would reverse this channel.

Army Postal Units and Army Post Offices were given specific instructions as to technical operating procedures on the Continent. Eighteen of these units were attached to Third U. S. Army and instructions were promptly issued that they maintain reserve postal stocks at a thirty day level and have necessary equipment available for immediate movement. Each Army Post Office was to provide mail service for troops located in its vicinity regardless of Army Post Office address used. A 1½-ton 6x6 vehicle was allotted to each Army Postal Unit by special War Department authorization.

Army postal plans provided for the attachment of two Army Postal Units to each corps. Others were to be controlled and located by Army Headquarters according to postal requirements. Collection, distribution, and delivery of mail was to begin as soon as practicable after arrival on the Continent. So far as possible, separate transportation was to be provided for mail. The Army Post Office and cable address to be used by an organization was to be determined by command assignment, and was not affected by either higher echelon attachment or geographic location of the organization.

The attachment of the French 2d Armored Division to Third U. S. Army necessitated special postal plans which included continuance of the French postal procedures where practicable. This division continued use of its money order system, but American postage and rates were used. The free mailing privilege to North Africa and the Near East was included. All mail was transported by the U. S. Army Postal Service, and that for delivery in North Africa and the Near East was delivered to the French Base Post Office in Algeria.

Based on the experience gained in the United Kingdom and the quality of service rendered there, Army postal installations were prepared to render postal service with maximum efficiency under combat conditions.

CHAPTER 2
PRE-OPERATIONAL ON CONTINENT

SECTION I

GENERAL

This phase was a transition period between planning and operations. Additional personnel and field equipment were obtained to meet unforseen deficiencies. Plans were revised where necessary and actual combat training obtained by attaching members of the Casualty Section to Third U. S. Army units engaged in combat under the First U. S. Army.

Officers from the various sub-sections of the Adjutant General's Section visited most of the Third U. S. Army units operating under other headquarters and also those units preparing for the coming operation. These semi-official visits proved extremely helpful.

During this phase, the Adjutant General's Section was consolidated and began to function as one unit with the exception of the Top Secret Control Sub-section which operated with the office of the Secretary General staff until 12 July, when this group was moved to the Adjutant General's bivouac in the Rear Echelon.

SECTION II

CASUALTY SECTION

This period was devoted to training the personnel of the Casualty Section by attaching one officer and four enlisted men to Third U. S. Army units actually engaged in combat under First U. S. Army.

It was anticipated that unreported casualties and correspondence on uncompleted cases would be received from Third U. S. Army units when they reverted to control of Third U. S. Army Headquarters on 1 August. In order that this correspondence (changes in status of casualties previously reported through First U. S. Army and initial casualties on which no action had yet been taken) could be processed by the Casualty Section, it was necessary that a complete casualty file be obtained from the First U. S. Army. To accomplish this, two machine trailers from 14th Machine Records Unit (Twelfth Corps Headquarters) were dispatched to First U. S. Army and reproduction of the cards effected.

In order to insure the rapid transmittal of Battle Casualty Reports, the following directive was issued on 31 July to all Corps and Division Commanders.

"1. In order to expedite the transmission and processing of Battle Casualty Reports, WD-Cas Forms 1, and Morning Reports, W.D., A.G.O. Forms 1 and 2, commanders concerned will institute the following procedure immediately upon reverting to control of or becoming operational under the Third U. S. Army.

"a. A daily courier will be dispatched by each Division to the Corps of attachment to deliver all Battle Casualty Reports and Morning Reports for all organic and attached troops prepared for the preceeding twenty-four (24) hour period.

"b. Corps Commanders will institute daily courier service between Corps and Army in order to relay the Battle Casualty Reports received from the Divisions and Corps troops to the Army A-G Casualty Section.

"2. Every effort will be made by Division Commanders to insure that the courier dispatched to Corps leaves at the earliest possible time each day and that all Battle Casualty Reports and correspondence pertaining thereto destined for the Army are forwarded by this method, and that Morning Reports, destined for the Corps Machine Records Unit, are dispatched in the same manner.

"3. Corps Commanders will not delay the relay of Division shipments of Battle Casualty Reports or allied matters. Immediately upon receipt of all Division shipments, the following action will be taken;

"a. Morning Reports will be turned over to the Machine Records Unit.

"b. Battle Casualty Reports and correspondence pertaining thereto, received from Divisions, will be placed in the Corps' Courier pouch.

"c. Corps Troops Battle Casualty Reports, Corps Medical Installations Admission and Disposition Reports (ETOUSA MD Forms 32½a), Corps Hospitals' Daily Disposition Reports (ETO-Cas Forms 4), will be placed in the Corps' Courier pouch.

"4. The courier dispatched from Corps will leave in sufficient time to arrive at Army not later than 1600 daily, and each Corps Commander will maintain a control to insure that a daily shipment or negative report is received from each Division under his control. Couriers will not be utilized for other purposes which would tend to delay the receipt of the reports at either Corps or Army.

"5. Upon arrival of the Corps Couriers at Army, delivery of the pouch will be made direct to the Adjutant General Casualty Section and receipt taken. Casualty correspondence originating at Army or higher headquarters and destined for the various Corps or Divisions will be turned over to the appropriate Corps courier upon arrival at Army for subsequent delivery to the addressee. Correspondence addressed to Divisions will be segregated at Corps and delivered to the appropriate Division by the respective Division couriers."

SECTION III

MACHINE RECORDS UNIT

Arriving in France, the 99th Machine Records Unit found a majority of Third U. S. Army troops on the Continent attached to First U. S. Army. Correspondingly, all status files for units destined to form the Third U. S. Army were being maintained temporarily by Machine Records Units of First U. S. Army.

Prior to 1 August, the Machine Records Unit made detailed plans and coordinated with First U. S. Army the transfer of files and services from First U. S. Army Machine Records Units to Third U. S. Army Machine Records Units, all such plans to be effective at the beginning of operations.

First U. S. Army Machine Records Units had discovered that tactical operations entailed constant shifting of divisions and separate units from corps to corps. This fact required the frequent shifting of files from Machine Records Unit to Machine Records Unit in an effort to keep pace with changing attachments of organizations. Accordingly, it was planned to freeze attachments of organizations to corps Machine Records Units for service until the tactical situation should stabilize sufficiently to insure long-term attachments of divisions to corps.

SECTION IV

POSTAL SECTION

Postal service to Third U. S. Army troops was begun immediately upon arrival on the Continent. Initially, all Army Postal Units and Army Post Offices called at a beach Postal Regulating Section for mail. Within a short time, however, mail delivery to Army Post Offices was begun. Some variation of this plan remained in effect until Third U. S. Army became operational. The urgency of continuous movement of mail across the beaches was so great that no energy was diverted from this task to the less essential chore of record keeping. No records of tonnage handled were kept. None exist.

Instructions were issued to all corps, divisions, and brigades that copies of special orders covering replacement personnel were to be furnished to the Ground Force Replacement System and to whatever Replacement Depot had cleared the personnel in question. By this means, the necessity to pass mail through replacement channels before delivery to addressees was obviated. Concurrently, all Army and Corps troops were instructed to report to the nearest Army Post Office for mail service.

During the pre-operational stage, Army postal installations became familiar with mail service on the Continent and demonstrated their fitness to perform any postal services required of them.

CHAPTER 3
AUGUST OPERATIONS

SECTION I

GENERAL

The first concern of the Adjutant General at the beginning of operations on 1 August was the division of the Section into Forward and Rear Echelon groups. Prior to 1 August, the entire headquarters had been camped together. When the Forward Echelon displaced from the initial bivouac it was accompanied by two officers and four enlisted men from the Adjutant General's Section on temporary duty with the Secretary General Staff to perform necessary Adjutant General's functions in the Forward Echelon. This arrangement did not prove satisfactory, and during the month of August a separate Adjutant General's sub-section, Forward Echelon (two officers and eight enlisted men), was created. Thereafter, this section remained with the Forward Echelon and [illegible] following functions:

Received, recorded, and routed all mail received by the Forward Echelon.

Authenticated all outgoing documents (mainly operational) dispatched from the Forward Echelon.

Maintained working files only, all documents of permanent record being sent to the Adjutant General's Record Section in the Rear Echelon.

This arrangement proved to possess the necessary flexibility and mobility, and during the month of August operated with gratifying smoothness.

The remainder of the Adjutant General's Section, organized as shown in Chapter 1, was retained in the Rear Echelon under direct control of the Adjutant General. The section functioned as an individual command group, maintaining its own bivouac and (except for messing) controlling its own administration during the operation.

Functions performed in the Adjutant General's Section (rear) during August operations were:

All personnel administration.

Processing of all Battle Casualty Reports received from units of Third U. S. Army.

All machine records work.

Supervision of the postal service within the Army.

Production of orders, maintenance of records, authentication of documents, and all other routine Adjutant General's functions.

The Classification Section worked closely with the G-1 Replacement Section in furnishing units with necessary replacements. This office checked all replacement requisitions for accuracy of figures as regards Table of Organization strength and authorized overstrength, and for correct specification serial numbers. Statistics obtained from replacement requisitions and inventories of specialists formed a basis for balancing overages and shortages between units and for the transfer of misassigned personnel. A file was maintained of replacement requisitions showing the date received and date forwarded, the number of replacements requisitioned, and the military occupational specialty of officers and enlisted men requisitioned. In order to expedite the flow of replacements, the closest possible liaison was maintained between divisional classification officers, replacement battalions, and the Army Classification Office.

Considering the wide flung disposition of the Third U. S. Army during this period, the functioning of administrative activities throughout the Third U. S. Army progressed with remarkable smoothness. This fact is attributed, in the greatest measure, to the attention given to instruction of Adjutants General and other administrative personnel in the series of schools held in the United Kingdom prior to operations (See Chapter 1). The greatest difficulties encountered during the month concerned the lag in transmission of communications which was inescapably concomitant to the unparalleled speed of the operation and diversity of tactical activities which spread at one time from the siege of channel ports to bridging operations on the MOSELLE.

SECTION II

CASUALTY SECTION

Organization of the Casualty Sub-section at the beginning of tactical operations is shown by chart (Annex 2). Initially, this organization was found to be adequate, but it very soon developed that personnel was insufficient. It had been anticipated that a back-log of battle casualty processing work would accompany troop units transferred in the midst of operations from other commands to Third U. S. Army. The volume of such unfinished business acquired in this manner, during the early weeks of August, exceeded all expectations. Sixteen to eighteen hours of labor per man per day were required in the Casualty Section to maintain desired standards of accuracy and speed.

Because of close association of battle casualty and machine records work, it was found to be essential that the Machine Records Unit and the Battle Casualty Section always operate together. It was necessary, therefore, that the Battle Casualty Section be so organized and equipped as to equal the Machine Records Unit in mobility in order that these sections would not be separated while displacing forward. To obtain harmony of operations a ten-ton semi-trailer van was obtained for the Casualty Section, whereby lines were run from Machine Records Unit generator to the Casualty Section tents and van, and the Casualty Section was attached to the Machine Records Unit for mess, supply, and coordination of administrative detail.

During August, Battle Casualty Reports prepared in unit personnel sections were submitted by special courier to the Battle Casualty Section. In appropriate cases, these reports were transmitted through the corps rear echelons, but none were processed by the corps. In addition, the Casualty Section received Admission and Disposition Reports from Army hospitals, Graves Registration Reports from the Army Graves Registration Service, and Straggler Reports from the Army Provost Marshal. All names listed on these reports were carded and cards alphabetically filed. All such reports received in the Section were checked against the alphabetical file, and changes in casualty status, if any, recorded thereon in order that the individual history of each casualty reported in any way might be maintained up to date. After checking against the casualty file, all Battle Casualty Reports were surrendered to the Machine Records Unit for the production of punched cards to be forwarded to higher headquarters, these cards constituting the official Battle Casualty Reports.

The volume of Admission and Disposition Reports received from hospitals in early August was so great that it became necessary during the month to decentralize the processing of this type of report to corps (in the case of hospitals assigned or attached to divisions and corps). The month brought many improvements in the casualty reporting system, among which were:

Closer coordination of casualty reporting in units of Allied Armies attached to Third U. S. Army.

Reduction of large categories of administrative errors encountered in practice.

Institution of close controls to avoid loss of reports.

Elimination of ambiguities in codes.

Late in August the strength of the Casualty Section was increased to two officers and twenty-five enlisted men. Thereafter, the Section functioned smoothly and accurately for the remainder of the month.

A resume of operations for August disclosed that reports of casualties in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	181	2,094	2,275
Died of Wounds Received in Action	21	368	389
Died of Injuries Received in Action	0	4	4
Seriously Wounded in Action	175	2,448	2,623
Seriously Injured in Action	7	115	122
Slightly Wounded in Action	292	4,948	5,240
Slightly Injured in Action	37	667	704
Captured by the Enemy	1	4	5
Missing in Action	98	1,750	1,848
Returned to Duty from a Previously Reported Casualty Status	*(184)	*(1,984)	*(2,088)
Totals	786	12,198	12,984

(* Not included in totals)

Time-lag between dates of casualties and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage:
1 - 10 Days	86%
11 - 20 Days	11.9%
21 - 30 Days	2.1%

SECTION III

MACHINE RECORDS UNIT

To provide a functional group for processing Battle Casualty Reports in the Machine Records Unit, a Casualty Section of the Machine Division of that unit was organized. This section contained nine machine and key-punch operators, coders, verifiers, and clerks. Organization of the Machine Records Unit at the beginning of August will be found in Annex 3. Operations during August disclosed no weaknesses of this organization. It was necessary to augment the casualty group by two additional key-punch operators four times during the month when the daily rate of casualties reported exceeded one thousand.

The Machine Records Unit key-punched Battle Casualty Cards from all Battle Casualty Reports received during August. Of these cards, five decks were produced; one to be retained in the Machine Records Unit, three for higher headquarters, and one to be sorted, collecting cards of units assigned or attached to corps. The selected cards were then sent by courier to Corps Machine Records Units. Upon receipt at Corps Machine Records Units, these cards were mechanically compared to status files in order that the corps status files should reflect the casualty status of the individuals. The machine records aspects of the Third U. S. Army casualty reporting system functioned during August with accuracy and speed.

The 39th Machine Records Unit, with the Adjutant General's Casualty Section attached, displaced forward four times during August, displaying the ability to break camp, move, and establish camp with a minimum of interruption in the essential work of administration. This mobility would not have been possible and the unit could not have kept pace with the Army but for the fact that sufficient transportation had been provided to avoid the necessity of shuttling.

Unidentified dead were reported in many cases. In order that the necessary identifications might be made, it was necessary on 8 August to direct that all Machine Records Units of the Third U. S. Army establish and maintain consolidated files of persons assigned to organizations served by such units. Not especially needed prior to operations, such files became indispensable when processing of casualty reports began.

Remainder of Machine Records Unit's activities for August consisted of the routine maintenance of files and production of established reports as listed in Section III, Chapter 1.

SECTION IV

POSTAL SECTION

During August, a Base Post Office was established at Cherbourg and the routing of incoming Third U. S. Army mail through this installation began. From the Base Post Office, mail was transported by Communications Zone to a Postal Regulating Section established and maintained at or near Third U. S. Army Rear Boundary. Eighteen Army Postal Units attached to Third U. S. Army obtained mail from this Postal Regulating Section, hauling such mail in organic transportation directly from the Postal Regulating Section to the Army Postal Units. Outgoing mail followed the same channels in reverse.

Some dislocation of the postal system resulted from the extreme fluidity of the tactical situation. The Postal Regulating Section particularly lacked sufficient transportation and personnel to cope with the rapid movements. Plans called for the publication and distribution of a Mail Distribution Scheme by Communications Zone, but by the time distribution was effected, the scheme, in many cases, was out of date and mail was frequently ochemed to the wrong Army Postal Unit.

To counter the evil of too frequent movement, a "leap-frog" method of displacing Army Postal Units was adopted. Under this system, Army Postal Units near the Army Rear Boundary and no longer needed in their current locations were displaced as far forward as the tactical situation permitted. Once set up, they were not again moved until the tactical situation required. Because Army Postal Units attached to corps were required to move too frequently for effective functioning, early plans to attach two Army Postal Units to each corps were modified to leave only one such unit with each corps.

From the beginning of the operation, Army Postal Units were habitually placed in buildings situated normally in towns. Such location of Army Postal Units greatly facilitated distribution of mail for the following reasons:

When the unit was located in a town, it could be found by mail clerks from troop units with ease.

Army Postal Units could begin to function immediately upon

Digitized by Google

arrival at new sites.

Desirable hard standing and turnarounds necessary to clear traffic quickly were available in towns.

Buildings afforded better protection for mail and equipment.

DECLASSIFIED

CHAPTER 4
SEPTEMBER OPERATIONS

SECTION I
GENERAL

In September, the pace of the operation slowed, and the Third U. S. Army entered a relatively static phase. Economy of materiel could be served and effectiveness of operations sharpened by closing the Army into a shallow area. Headquarters and Army Troops moved close behind the corps. In the Adjutant General's Section, the effects of the change in tempo and dispositions were these:

Battle Casualty Reporting -- Couriers from the corps headquarters drove no more than an hour each day to reach the Army Adjutant General's Casualty Section. Reports came, therefore, with less lag, more dependability. By telephone and in person, doubtful situations could be explained, questions answered. Correspondence diminished. Proximity is an aid to understanding. Adjusted to its work, the Casualty Section now ran more quietly and with less effort -- though the total work load for the month was slightly up.

Mail Service -- See Section IV, following.

Machine Records Units -- Slowing the tempo of the operation made easier the control of morning reports. Distance from the beaches increased the difficulty of machine records supply. Otherwise, conditions in September had little or no effect on machine records operation. (See Section III).

Air Courier Service for Battle Casualty Reports -- At the beginning of the operation, a special air courier service was established to expedite transmission of Battle Casualty Reports from Army Headquarters to Theater Headquarters. It was found that Battle Casualty Reports submitted through this channel reached Theater Headquarters belatedly or not at all. In all such cases, investigation revealed either that the reports had not reached the special courier channel or that weather had prevented scheduled flight. Sometimes reports simply disappeared enroute. After the Army Headquarters advanced from NORMANDY, it became necessary to send reports by motor vehicle over long distances to the proper landing strip to be picked up by the courier, or to find some nearby landing strip from which a plane was scheduled to fly to the landing strip at the beach, thus improvising an unscheduled air relay system. As the Army Headquarters increased its distance from the beach, it became necessary to relay reports through several landing strips. All these landing strips were temporary in nature. They possessed no organized means of receiving and processing mail. With each move of the Headquarters, it became necessary to find another landing strip and arrange for an additional stage in the relay. As a consequence of these highly unreliable conditions, it was found that almost no dependence could be placed on the courier system. Even when it worked at its best, much time was lost. Had the system been able to utilize fixed airports and regularly scheduled flights; had the Headquarters been stationary; and had the distances been sufficiently great to justify air transport, the courier system might have functioned satisfactorily. Under existing conditions, however, it failed. On 10 September, it was abandoned.

To comply with the provisions of Public Law 277, attention turned early in September to the subject of soldier voting. A qualified officer from the 10th Replacement Depot joined the Adjutant General's Section on 5 September and was appointed Soldier Voting Officer. This officer began immediately to coordinate the distribution of voting posters and other informational material and to prepare for the distribution of ballots. He made visits to all corps and divisions to coordinate soldier voting activities. It was required that all organizations of the Third U. S. Army appoint Soldier Voting Officers, and rosters of the Third U. S. Army appoint Soldier Voting Officers, and suitable checks were initiated at this Headquarters to assure compliance with this requirement. The Adjutant General obtained the assistance of the Inspector General in soldier voting activities, and the Inspector General and his assistants began in September to include inspection of soldier voting activities in all inspections requiring visits to units of Third U. S. Army.

SECTION II
CASUALTY SECTION

On 18 September, the Headquarters moved to Nivosse within an hour's drive of corps rear echelons. The proximity of the corps rear echelons to the Army Casualty Section facilitated the work of corps casualty couriers and enabled a much closer control of battle casualty reports to be maintained.

On 20 September, a system of processing one day's business in one day was adopted, resulting in more expeditious handling of all work. The new system affected favorably the morale of the men. Until this time, personnel of the Casualty Section had been required to work every night without relief. All work received during the course of a day was processed on the following day.

On 28 September, XV Corps, composed of the 79th Infantry Division and the French 2d Armored Division, was lent to the Third U. S. Army by attachment to the adjacent Seventh U. S. Army. Because of the difference in casualty reporting procedures employed in the two armies, processing of Battle Casualty Reports and allied matters was continued under the Third U. S. Army until such time as the Seventh U. S. Army became familiar with methods and procedures in the European Theater of Operations.

Many inquiries from relatives and friends of casualties revealed that information concerning the casualty status of individuals undoubtedly was leaking into unauthorized channels. To correct this undesirable condition, instructions were issued to all commanders on 30 September as follows:

"1. In order to avoid confusion and establish uniformity in the preparation of replies to letters of inquiry concerning casualties received from relatives or friends, the following procedure will govern in this command.

"a. Receipt of the letter of inquiry may be acknowledged, but information given only to the effect that the letter has been received and turned over to the proper authorities for reply; or, if the request has been received and information desired is being secured and will be sent to the War Department from which agency you may expect a reply in the near future.' Under no circumstances will information concerning the casualty be furnished direct to the writer.

"b. The letter of inquiry will then be turned over to the Personnel Officer or other designated representative of the commanding officer for information through channels giving such detailed information as is available.

"2. The responsible officer will prepare a forwarding indorsement to the letter of inquiry which will contain the following information:

"a. The correct grade, name, and Army Serial Number of the individual on whom the inquiry has been received.

"b. The date and type of casualty as shown on the records of the organization.

"c. All additional information that is available or can be secured regarding the details or circumstances under which the casualty occurred and upon which the War Department can base an answer to the inquiry."

A review of operations for September disclosed that casualties in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	156	1,798	1,954
Died of Wounds Received in Action	30	316	346
Died of Injuries Received in Action	0	10	10
Seriously Injured in Action	185	2,472	2,657
Slightly Wounded in Action	5	77	82
Slightly Injured in Action	345	5,888	6,233
Captured by the Enemy	36	642	678
Missing in Action	7	6	13
Returned to Duty from a previously reported Casualty Status	90	1,858	1,948
Totals	*(156)	*(8,460)	*(8,616)
	854	13,057	13,921

(* Not included in totals)

During this period 298 reports of Non-battle Casualties (Death, Missing, Interned) were processed, 5,456 sets of personnel records for deceased, missing, missing in action, and captured personnel were handled, and seventy-seven Reports of Investigation, W.D., A.G.O. Forms 51, of non-battle deaths and injuries requiring investigation were reviewed.

SECTION III
MACHINE RECORDS UNIT

The organic load of machine records forms in all Machine Records Units in the Third U. S. Army was considerably depleted by September. The commanding officer of the 39th Machine Records Unit consequently made three trips to CHARLES BRACH where machine records stocks had been unloaded, to assist in locating these stocks and in coordinating their distribution to Third U. S. Army Machine Records Units whose supplies were depleted. In all cases, Machine Records Units sent organic transportation back to the beach to pick up such forms as were issued. By the close of September, the stock of essential forms had not been exhausted, but it was dangerously low and the supply situation was precarious.

SECTION IV
POSTAL SECTION

Increased distances from ports and beaches; lack of rail transportation; and the worn, damaged, and congested condition of the roads, all combined to create new delays in the receipt of mail in the Army Area. Incoming first class mail arriving by air from the United States and the United Kingdom at airports in the interior, was received with dispatch. Parcel post and other mail coming over the beaches and through the ports, in many cases, was long delayed. Within troops ceased the work of the Army Postal Units.

The greatest difficulties in handling the mail were found to lie in distance and movement, and not in volume of mail. When units were distant from their Army Postal Units, the problem of transporting the mail from the Army Postal Unit to the troops was measured in proportion to the distance, the availability of transportation, the condition of roads, and the accessibility of Army Postal Units. When troops moved frequently and frequently changed Army Postal Unit assignments, delays occurred. In these cases, very much mail sent from Base Post Offices and Postal Regulating Sections to units, arrived at the station was no longer present. It was necessary then to forward this mail. On many occasions, this process was repeated several times before the mail at length overtook the organization for which it was intended. It was found to be desirable, when the Army occupied a deep area, to hold the maximum number of Army Postal Units under direct Army control in order that they might be moved quickly to locations of high density of troops and also to prevent the movement of Army Postal Units until it was necessary that they be moved. Since the movement of an Army Postal Unit breaks completely the continuity of mail service to all units that it serves, it was most important that unnecessary moves of Army Postal Units be not made. It was found desirable that sufficient Army Postal Units remain attached to corps during field phases to process mail for corps troops concentrated in the corps area. Since many corps troop units remained behind the corps rear boundary, it was found most one Army Postal Unit per corps was adequate during August. As the situation stabilized, however, and more and more units of corps troops were concentrated in the corps area, it became necessary to attach an additional Army Postal Unit to each corps to process mail for corps troops. In September, the shallow Army Area and the relative infrequency of movement of army units of Army Troops relieved the burden on Army Postal Units

DECLASSIFIED

Digitized by Google

It was found that, in some cases, mail received for casualties had been returned to senders bearing notation of casualty status. Such mail often was returned to senders prior to War Department notification of the casualty. These cases became the subject of War Department inquiry and investigation. To eliminate this practice, on 1 September instructions substantially as follows were issued to all troops:

* * * * *

"All Postal Officers will take immediate, positive, and personal action to insure compliance with the following:

"Undeliverable mail addressed to personnel who become casualties within this theater will be indorsed as indicated below by the unit commander or officer designated to certify the status of the addressees, and returned to the APO serving the unit for disposition.

1. Mail addressed to casualties whose status is "Killed in Action", "accidentally killed", "died in hospital" or "dead" will be indorsed "Deceased".

2. Mail addressed to casualties whose status is "missing", "missing in action", "captured by the enemy" or "prisoner of war" will be indorsed "Missing".

3. Parcel mail will be indorsed with the additional entry "Return to sender without charge by authority of the Third Assistant Postmaster General".

"All classes of mail to addressees who become casualties while outside this theater, will be indorsed with the appropriate notation required by subparagraphs 1, 2, or 3, above, and forwarded, under franked label, direct to the Casualty Branch, Adjutant General's Office, Washington 25, D. C.

"Troops going into action will not be permitted to leave mail behind for future dispatch. Such mail may reach the addressee long after the official casualty notification has been sent, resulting in needless distress, anxiety and confusion to the next of kin, and causing general distrust of the Army casualty reporting system.

"A separate receptacle will be provided at each APO for the deposit of properly certified casualty mail by unit mail clerks. Postal Officers will instruct all unit mail clerks that casualty mail must be separated from other mail prior to deposit at the APO.

"Severe disciplinary action will be taken in cases of future reports of violation of casualty mail instructions."

OCMH Declassification Instructions

SECTION I

GENERAL

Move to Buildings: In HAGUE, headquarters offices and barracks for enlisted men were established in buildings, and billets for officers were obtained in the City. Buildings occupied in the main of the retreating enemy were found in a condition of filth and disorder, infested with vermin, and in need of repair. In addition to the essential police and repair work, some regrouping of activities to fit the building arrangement was necessary, and some structural alterations of buildings were required. All operating schedules had to be rearranged. Fire guards were established. Guard orders were amended.

It required three days to set the Section up in buildings. In the field, three hours had been adequate time to establish the camp and begin operations.

During October, there was an increase in the rate of incidence of upper respiratory diseases which was believed to attributable to living conditions in buildings.

Voting of Federal ballots previously issued took place in October.

SECTION II

CASUALTY SECTION

The 26th and 95th Infantry Divisions, the 10th Armored Division, and Headquarters III Corps were attached to Third U. S. Army during the month. None of these units had been in action, and none had any experience in battle casualty reporting. It was necessary that battle casualty sections be immediately organized in each of these headquarters and that personnel be promptly trained in order that the desired standard of excellence in casualty reporting might be attained as soon as units were committed to action.

Battle casualty sections in the new corps and division headquarters were organized and trained by means of interchange of personnel. Selected individuals were transferred into the casualty sections of the division headquarters in order to make available casualty reporting experience in units having no prior concern with this function. An officer selected from Headquarters III Corps was attached to the AG Casualty Section, this Headquarters, to study methods and procedures.

The Seventh U. S. Army, to which the XV Corps was attached upon its relief from Third U. S. Army, was scheduled for subsequent transfer from the North African Theater of Operations to the European Theater of Operations. It was desirable to maintain continuity of method in battle casualty reporting from the XV Corps during the period between attachment of this corps to the Seventh U. S. Army and transfer of the Seventh U. S. Army to the European Theater of Operations. During this period, casualties from the Seventh U. S. Army, including the XV Corps, were evacuated through the North African Theater of Operations. It was found disadvantageous to process battle casualty reports through one channel when the casualties themselves were evacuated through another. While the battle casualty reports were submitted to this Headquarters, much information required to be checked against these reports at army headquarters level was submitted to Seventh U. S. Army Headquarters, and this information had to be obtained from Seventh U. S. Army Headquarters before battle casualty reports could be processed. Delay was usually encountered in getting the necessary information. Consequently, on 31 October, the processing of battle casualty reports for XV Corps was released to Headquarters Seventh U. S. Army.

A review of operations for October discloses that casualties in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	117	1,742	1,859
Died of Wounds Received in Action	23	368	391
Died of Injuries Received in Action	2	0	2
Seriously Wounded in Action	114	2,155	2,269
Seriously Injured in Action	7	60	67
Slightly Wounded in Action	345	5,148	5,493
Slightly Injured in Action	20	568	588
Captured by the Enemy	1	14	15
Missing in Action	69	2,279	2,348
Returned to Duty from a Previously Reported Casualty Status	*(218)	*(4,018)	*(4,236)
Totals	598	12,334	12,932

(* Not included in totals)

During this period 3,566 sets of personnel records for deceased, missing, missing in action, and captured personnel were processed; 61 Reports of Investigation, WD AGO Form 51, on non-battle deaths and injuries requiring investigation were reviewed. Non-Battle Casualty Reports, ETO-Cas Form 2, on deceased and missing personnel as shown below were cleared by this office:

	OFFICERS	ENLISTED MEN
Deceased	4	86
Missing	0	40
Total	4	126

SECTION III

MACHINE RECORDS UNIT

Orders were received on 15 October requiring the establishment of a special officer-courier service to deliver machine records strength cards to the Central Machine Records Unit, Headquarters European Theater of Operations. The establishment of this service called for the semi-monthly dispatching of a machine records officer from this Headquarters to PARIS. Since, at this time, difficulties in obtaining machine records supplies still existed, it was planned to take advantage of these trips to obtain necessary supplies of cards and paper stock for operation of Machine Records Units of the Third U. S. Army.

SECTION IV

POSTAL SECTION

Approximately 400 tons of parcel post mail arrived at the Postal Regulating Section during 13 October. This accretion represented about a month's back-log of mail of this category. Since the Postal Regulating Section was not adequately manned to process such an accumulation quickly, thirty men were furnished from Third U. S. Army personnel to assist in unloading and distributing this mail.

To assist in obtaining mail at the Postal Regulating Section, arrangements were made to send three 2½-ton trucks and trailers daily to the Base Post Office near PARIS for first class mail.

The Postal Section was augmented on 26 October by an Assistant Army Postal Officer. This was found desirable in order to free the Army Postal Officer from routine office administration to enable him more readily to visit Army Postal Units of the Army.

There follows an extract of instructions issued to all lower echelon commanders concerning the handling of Christmas mail:

"Corps and division commanders will detail additional personnel to assist in the handling of mail in APOs. Regimental and battalion post offices will be augmented by additional personnel, and where necessary, assistance will be given company mail clerks.

"Each separate battalion and company commander will designate an additional assistant unit mail clerk to assist in the handling of mail.

"Mail will not be permitted to accumulate but will be delivered within 24 hours of receipt, unless precluded therefrom for tactical reasons.

"Insofar as possible, Army transportation will be used in delivering mail to APOs during November and December."

CHAPTER 6
NOVEMBER OPERATIONS

SECTION I

GENERAL

November was a month of routine operations for the Adjutant General's Section. The Third U. S. Army attack, which began on 8 November, occasioned no change in Adjutant General's operations except an increase in battle casualties which will be treated in Section II of this chapter.

Postal problems encountered in prior months persisted (See Section IV following).

SECTION II

CASUALTY SECTION

The offensive launched on 8 November continued throughout the remainder of the month. Battle casualties suffered by Third U. S. Army units during November were heavier than for any prior month of the operation. As a consequence, the large volume of battle casualty reports received developed additional problems in the Battle Casualty Section. One of these problems was the preparation of cards from Admission and Disposition Reports received by the Casualty Section from hospital installations. In order to maintain the central battle casualty files, it had been the practice to type a card covering each entry on all Admission and Disposition Reports. Because of the large volume of such reports received during November, it became impossible with the personnel available to maintain the file in a current condition. Study of this problem by the Casualty Section and the Machine Records Unit revealed that it would be possible for the Machine Records Unit to produce interpreted punch cards from Admission and Disposition Reports as a by-product of normal preparation of cards for the machine records status file. On 21 November, instructions were issued to effect minor modifications in the Admission and Disposition Reports in order to render them susceptible of machine records processing, and the new system was put into effect. A considerable saving of labor within the Casualty Section resulted and increased speed and accuracy in handling battle casualty reports was obtained.

A review of operations for November discloses that casualties in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	167	2,841	2,408
Died of Wounds Received in Action	22	301	323
Died of Injuries Received in Action	0	7	7
Seriously Wounded in Action	182	2,588	2,770
Seriously Injured in Action	9	148	157
Slightly Wounded in Action	429	7,726	8,155
Slightly Injured in Action	81	1,937	2,018
Captured by the Enemy	2	19	21
Missing in Action	81	2,105	2,186
Returned to Duty from a Previously Reported Casualty Status	*(154)	*(2,741)	*(2,895)
Totals	973	17,072	18,045

(* Not included in totals)

During the same period 1,718 sets of personnel records of deceased, missing, missing in action, and captured personnel were processed; seventy-eight Reports of Investigation, W.D., A.G.O. Forms 51, on non-battle incurred deaths and injuries requiring investigation were reviewed. Non-battle Casualty Reports, ETO-Cas Form 2, on deceased and missing personnel, as shown below, were cleared by this office:

Digitized by Google

	OFFICERS	ENLISTED MEN
Deceased	3	54
Missing	0	15
Total	3	69

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage:
1 - 10 Days	88.69%
11 - 20 Days	10.62%
21 - 30 Days	.19%
Over 30 Days	.5%

SECTION III

MACHINE RECORDS UNIT

By November, the problem of absentees without leave had reached major proportions. To assist in apprehending offenders, the Provost Marshal, this Headquarters, needed an up to date list of names of such absentees for distribution to all his agencies. To provide the desired list, it was directed on 25 November that each Corps Machine Records Unit submit weekly to the 59th Machine Records Unit a file of status cards for all individuals assigned or attached unassigned to organizations served by the Corps Machine Records Units who are in an outstanding absent without leave status as of 2400 hours each Saturday. Files were to include cards for individuals who had been listed in prior weeks as absent without leave and who had not been reported returned to military control at the cut off time. Upon receipt at the Machine Records Unit, these cards were consolidated with similar cards covering Army Troops prepared by the Machine Records Unit, this Headquarters, and an up to date corrected listing was run for the Provost Marshal.

During the latter part of November, the Machine Records Unit completed a statistical study of battle casualties of all Third U. S. Army units during the first three months of operations, 1 August to 31 October. Results of this study follow:

BATTLE CASUALTIES BY NUMBERS

Subdivision of Command	Battle Deaths	Missing In Action	All Other Battle Casualties	Total All Casualties
Third U. S. Army Troops	86	16	279	381
VIII Corps Troops	88	54	393	535
XII Corps Troops	239	117	791	1,147
XV Corps Troops	138	81	601	733
XX Corps Troops	263	64	715	1,042
4th Armored Division	358	125	1,060	1,543
5th Armored Division	121	26	446	593
6th Infantry Division	764	519	3,146	4,429
6th Armored Division	368	65	1,024	1,457
7th Armored Division	227	165	1,138	1,530
8th Infantry Division	263	170	1,336	1,769
26th Infantry Division	116	122	457	695
35th Infantry Division	870	483	3,489	5,142
44th Infantry Division	35		201	236
79th Infantry Division	570	412	3,404	4,386
80th Infantry Division	1,025	696	3,455	5,176
83d Infantry Division	532	81	2,155	2,768
90th Infantry Division	411	109	2,208	2,728
95th Infantry Division	14	2	60	76
Total Casualties - Third U. S. Army	6,488	3,610	26,318	36,416

BATTLE CASUALTIES BY PERCENTAGES

Subdivision of Command	Battle Deaths	Missing In Action	All Other Battle Casualties	Total All Casualties
Third U. S. Army Troops	1.3	.4	1.1	1.0
VIII Corps Troops	1.3	1.5	2.0	1.4
XII Corps Troops	3.7	3.2	3.0	3.2
XV Corps Troops	2.1	.7	2.4	2.2
XX Corps Troops	4.1	1.8	2.5	2.9

8th Infantry Division	257	4.3
26th Infantry Division	17	.3
35th Infantry Division	948	16.0
44th Infantry Division	4	.0
79th Infantry Division	655	11.0
80th Infantry Division	754	12.5
83d Infantry Division	658	11.0
90th Infantry Division	589	10.0
95th Infantry Division	1	.0
Total - Third U. S. Army	5,963	100%

SECTION IV

POSTAL SECTION

By November, delays had developed in receipt of mail from the United States by Army postal units of Third U. S. Army. The situation was reported to the Commanding General, European Theater of Operations. On 3 November, the report brought the following reply from the Theater Commander:

"1. The facts are recognized as stated in the basic letter, and result simply from the fact that the air lift allocated the Army Postal Service for movement of air mails from the U. S. to this theater was insufficient to carry the air mail tonnage developed in the port of New York. Excess had to be shipped by water with consequent delay.

"2. It is regrettable but true that a similar situation exists for the current month; and because of higher priority requirements in critical items, such as medical supplies and special ammunition, it was necessary to ship from New York a considerable amount of air mail by water transportation. As a result air mail which normally would have been received here during the week of 22 October will not arrive in the theater until the second week in November. Likewise, it is apparent that the same conditions will exist each month until such time as it is operationally possible to allocate sufficient air tonnage to handle the air mail developed in New York for this theater."

To offset as far as possible the lag in movement of mail from the United States to the European Theater of Operations, steps were taken to accelerate to the maximum, movement within the Army area and from the Base Post Office to the Postal Regulating Section. On 29 November, a daily allotment of 6,000 pounds was authorized to be moved by air from the Base Post Office to the Postal Regulating Section at VERDUN. The practice already begun of assisting in the movement of mail to the Postal Regulating Section by sending army transportation to the Base Post Office, was continued. During November, a total of twelve 2½-ton trucks and one-ton trailers from Third U. S. Army sources were placed at the disposal of the 13th Postal Regulating Section to assist in transporting mail.

On the 27th, 29th, and 30th of November, large quantities of first class mail were received, and throughout the month large volumes of Christmas parcels were received at irregular intervals.

For the first time in this operation, a record of mail received by the 13th Postal Regulating Section during the entire month was kept. Tonnages and number of pouches received are shown below. These figures should not be taken to represent mail destined exclusively for the Third U. S. Army, as certain Seventh U. S. Army units were served by the 13th Postal Regulating Section during the month, and part of the mail received went to these units.

First Class Mail		Daily Average
Approximate tonnage received	370	12
Total number pouches received	19,287	641
Parcel Post		
Approximate tonnage received	1,536	51
Total number sacks received	84,020	2,800

CHAPTER 7
DECEMBER OPERATIONS

SECTION I

GENERAL

During December, routine operations continued in the Adjutant General's Section with little interruption. The German counteroffensive beginning on 16 December resulted in over-loading the Casualty Section. (See Section II, following). The Christmas Season brought dislocations in the postal service. (See Section IV, following).

During the month, six enlisted men were lost from the Adjutant General's Section for retraining as infantrymen, and two officers and four enlisted men from two divisions were attached for short periods to the Casualty Section to study casualty reporting methods and procedures.

SECTION II

CASUALTY SECTION

The seige of BASTOGNE (P-55) and the heavy casualties caused thereby, particularly the large numbers of individuals missing in action as a sequence of events when many units were overrun and scattered, caused difficulties and delays in casualty reporting.

Although the Third U. S. Army was not involved in the initial German assault, the attachment on 20 December of the VIII Corps and the 101st Airborne Division resulted in channeling through the Adjutant General's Section great numbers of reports of casualties occuring prior to the gain of these units by Third U. S. Army. Accumulations of casualty reports in these units prior to their attachment to Third U. S. Army and shortly thereafter, resulted in the receipt of a heavy backlog of casualty reports after 20 December. Since no additional personnel was immediately available to assist in processing these reports, the Casualty Section was required to observe a most severe work schedule from 20 December to the close of the month in order to stay abreast of the work load involved. The sudden increase of Third U. S. Army to include four corps and nineteen divisions had not been anticipated in establishing the Casualty Section, and while no casualty reports were delayed by processing at this Headquarters during this period, nevertheless the Casualty Section reached its absolute capacity and could not have handled a greater load without additional personnel. A review of casualty reporting operations for December disclosed that casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	130	2,432	2,562
Died of Wounds Received in Action	27	418	445
Died of Injuries Received in Action	0	5	5
Seriously Wounded in Action	111	1,634	1,745
Seriously Injured in Action	4	57	61
Slightly Wounded in Action	380	6,858	7,238
Slightly Injured in Action	63	1,339	1,402
Captured by the Enemy	0	17	17
Missing in Action	139	3,038	3,177
Returned to Duty from a Previously Reported Casualty Status	*(351)	*(3,068)	*(3,219)
Totals	854	15,818	16,652

(* Not included in totals).

During the same period, 3,667 sets of personnel records of deceased, missing, missing in action, and captured personnel were processed; ninety-two Reports of Investigation, W.D., A.G.O. Form 51, on ceased; ninety-two Reports of Investigation, W.D., A.G.O. Form 51, on non-battle incurred deaths and injuries requiring investigation were reviewed. Non-battle Casualty Reports, MTO-Cas Form 2, on deceased and missing personnel, as shown below, were cleared by this office:

	Officers	Enlisted Men
Deceased	5	0
Missing	61	18
Totals	66	18

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage
1 - 10 Days	86.67%
11 - 20 Days	11.80%
21 - 30 Days	1.01%
Over 30 Days	.52%

SECTION III

MACHINE RECORDS UNIT

December brought one major change in the general operating procedures in the 39th Machine Records Unit. The new procedure was concerned with the maintenance of patients control cards, key punched in the Machine Records Unit from Admission and Disposition Reports rendered by Third U. S. Army hospitals. The patients control cards were employed for the purpose of keeping organizations of the Third U. S. Army currently informed of the whereabouts of personnel lost to hospitals and the status of such personnel during the period spent in the Third U. S. Army chain of evacuation. The use of this card also enabled the former organizations of evacuated personnel to post to Service Records current changes in the status of individuals during the time that such individuals remained in Third U. S. Army hospitals. Use of these cards also serves as notification to organizations of assignment of the evacuation of personnel from Third U. S. Army hospitals to hospitals of the Communications Zone.

The patients control card, key punched from Admission and Disposition Reports contained the following information:

Full name of individual.
Army serial number.
Name of hospital in which the individual is hospitalized.
Type of casualty.
Name of former parent unit of individual.
Date of change.

In addition to distributing cards so produced to the former organizations of patients concerned, copies of such cards were furnished to the Battle Casualty Section for use in maintaining the central casualty card file in a current condition.

SECTION IV

POSTAL SECTION

The month of December was marked by a decided decline in the receipt of first class mail and a large increase in the receipt of parcel post. Receipt of all classes of mail continued to be very irregular.

Arrangements begun during October and continued throughout November to send three 2½-ton trucks and trailers daily to the Base Post Office for first class mail were discontinued 9 December because these trucks were urgently needed to assist Army Postal Units in hauling mail from the Postal Regulating Section. Because of the tactical situation, all Army vehicles located at the Postal Regulating Section for assisting Army Postal Units were withdrawn on 19 December. For the period 19-26 December, inclusive, no trucks were available for assisting Army Postal Units in hauling mail. However, many Army Postal Units were able to borrow transportation from units served by them. No unusual delays were noted. Army again furnished transportation on 27 December, beginning with four vehicles and augmenting this number until a total of thirty-five were being furnished on 31 December.

The intermittent movement of first class mail by plane from the United Kingdom to an airstrip near the Postal Regulating Section was begun 5 December. Air transportation from the Base Post Office [illegible] also continued, but not on any regular schedule.

Some idea of the increase in the amount of parcel post received by Army may be noted by the figures below:

	Sacks per Month	Sacks Daily Average
October	50,100	1,616
November	84,020	2,800
December	246,057	7,937

A daily record of receipt of mail by the 13th Postal Regulating Section for the month of December follows:

DATE	(1st Cl) POUCHES	(PP) SACKS	TOTAL
December 1	413	2,309	2,722
2	460	860	1,320
3	420	8,706	9,126
4	269	4,751	5,020
5	223	6,677	6,900
6	691	4,227	4,918
7	255	5,744	5,999
8	416	6,931	7,347
9	391	7,435	7,826
10	486	7,866	8,352
11	248	6,345	6,593
12	1,177	7,446	8,623
13	301	8,180	8,481
14	1,378	5,593	6,971
15	399	7,271	7,670
16	1,290	756	2,046
17	395	6,274	6,669
18	690	16,757	17,447
19	461	18,812	19,273
20	380	11,017	11,397
21	29	11,887	11,916
22	629	11,229	12,058
23	524	10,361	10,885
24	165	11,015	11,180
25	316	8,867	9,183
26	10	350	360
27	628	8,031	8,659
28	24	6,650	6,674
29	308	7,968	8,276
30	1,285	10,479	11,764
31	346	15,294	15,640
Totals	14,987	246,057	261,044
December Daily Average	483	7,937	8,420
November Daily Average	841	2,800	3,641
October Daily Average	474	1,616	2,090

Despite the long distances Army Postal Units had to travel for mail and the volume handled, no appreciable delay in mail after reaching Army area was experienced.

CHAPTER 8
JANUARY OPERATIONS

SECTION I

REMAIL

The movement from NANCY, FRANCE (F-91), to EUPEN, BELGIUM (P-70), completed on this section on 7 January, required more time than any previous move during the operation. This fact was attributed to congestion in loading trucks from buildings with limited available working space, the additional time and effort required to move evacuated buildings, the difficulties inherent in unloading vehicles at a facility lacking a single entrance, the regrouping of activities to fit the new building, and the rearrangement of operating schedules necessary to adjust to conditions in the new location. These duties, together with the packing of mail, where were accumulated during the time necessary to complete the move, entailed additions, adjustments and reorganization of personnel for three days after arrival in the new location at EUPEN.

During January, the casualty section reported the lowest monthly casualty total since the volume of Army casualty reports received during any prior month of the operation. (See section VI, following.)

The Assistant Secretary General, Third U. S. Army, although remote at Theater Headquarters during the period, was kept fully informed with the very important revision of policies governing processing procedures and information to be followed throughout the Theater. (See section III, following.)

The volume of parcel post mail received during January receded appreciably from the peak load received during the month of December and there was a corresponding increase in receipt of first class mail. (See Section IV, following).

SECTION II

CASUALTY SECTION

January was a tertiary operational month for the casualty section, there being a total of [illegible] days during which casualty reports were received from the [illegible] Division, the [illegible] Division, the [illegible] Armored Division, the [illegible] Infantry Division, and the [illegible] U. S. Army, as follows:

Division	Days
[illegible]	31
[illegible]	31
[illegible]	31
[illegible]	31
[illegible]	31

Immediate and overall prepared casualty files were furnished to [illegible] Army, as well as the necessary disruption of administrative functions [illegible] had been overcome by the casualty [illegible] increased the difficulties of verification. [illegible] status of casualties on whom changes of casualty classification were reported, and increased the [illegible] expressing letters of inquiry, letters of condolence, and other personnel records.

The necessity for rapid instruction of administrative personnel in the policies and procedures employed in Third U. S. Army where these differed from those followed in armies to which the recently joined units had been attached.

Long lines of communication between divisions in METZ [illegible] and LUXEMBOURG and the Third U. S. Army Rear Echelon at NANCY, FRANCE (F-91). This situation, of course, was improved when the Third U. S. Army Rear Echelon moved to [illegible] LUXEMBOURG.

The unexpected additional volume of casualty reports very soon overloaded the Casualty section to the point where it was impossible to clear the daily reports with the required degree of accuracy and speed. The only solution was to augment the personnel of the casualty section by eight additional men on temporary duty from units not in combat. These men joined on 15 January. Thereafter, the casualty section was able to maintain the desired standard of performance.

A review of casualty reporting operations for January disclosed that casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	254	5,482	[illegible]
Died of Wounds Received in Action	45	792	[illegible]
Died of Injuries Received in Action	1	7	[illegible]
Missing in Action	249	5,466	[illegible]
Wounded in Action	49	943	[illegible]
Slightly Wounded in Action	259	11,251	[illegible]
Severely Injured in Action	120	[illegible]	[illegible]
Returned by the Enemy	1	[illegible]	[illegible]
Prisoner in Action	107	19,566	[illegible]
Returned to Duty from a Previously Reported Status	252	10,177	[illegible]
Erroneous Reports, Such as Cattle Casualties	4	164	[illegible]
Totals	[illegible]	[illegible]	[illegible]

During the same period, [illegible] sets of personal records of deceased officers, missing in action, and personnel were processed. [illegible] reports of investigation into Missing in Action, Unfavorable Discharge and Line of Duty determination were received. Casualty reports, [illegible] were received from deceased and missing personnel, as shown below, were cleared by this office:

	Officers	Enlisted Men
Deceased	[illegible]	[illegible]
Missing	[illegible]	[illegible]
Totals	8	128

The lag between dates of casualty and dates on which casualty reports were sent to higher headquarters from the Adjutant General's casualty section was as follows:

Percentage Within	Percentage
1 - 10 days	[illegible]
11 - 20 days	[illegible]
21 - 30 days	[illegible]
over 30 days	[illegible]

SECTION III

MAIL DIRECTORY SERVICE

Prior to the mail directory service, a serious problem existed in the [illegible] Army, as well as the remainder of the European Theater of Operations, as [illegible] Army headquarters moved, [illegible] of letters addressed to persons in the [illegible] headquarters. [illegible] Army Postal Service [illegible] the mail directory service, which was established to [illegible] the mail [illegible] necessary records in a central [illegible] Army area. A [illegible] number of the procedures described in Section III, [illegible] Army, of this report, went far towards solving the problem although [illegible] U. S. Army, results obtained during December were such that the Theater Adjutant General investigated the desirability of adopting similar procedures on a theater wide basis, and during the period 2 - 5 January conducted conferences at Theater Headquarters to study the problem and apply the solution.

With slight modification, Third U. S. Army's procedures were approved under the descriptive term "Casualty Locator Procedure" for adoption throughout the Theater. The revised procedures were published from Theater Headquarters on 25 January, to become effective 1 February.

SECTION IV

POSTAL SECTION

Arrangements placing trucks at the disposal of the 15th Postal Regulating section to assist postal installations in transporting mail to their army, postal units were continued with little interruption throughout the month. Because of the tactical situation, trucks were withdrawn during the period 5 January to 8 January, but were made available on 9 January. On this date, six trucks were furnished to the 15th Postal Regulating Section. This number was steadily augmented until 13 January, at which time thirty-one trucks were furnished. After 13 January, the number was reduced to sixteen, which were furnished daily throughout the remainder of the month.

Mail received by the 15th Postal Regulating Section during the month of January was as follows:

First Class Mail

Total number of pouches received - - 21,780
Daily average number of pouches - - 702

Parcel Post

Total number of sacks received - - 177,993
Daily average number of sacks - - 5,700

FEBRUARY OPERATIONS

SECTION I

GENERAL

On 6 and 7 February, the Adjutant General's Section moved, with the remainder of the Rear Echelon, a distance of twelve miles from SECH (F-75) to the City of LUXEMBOURG (P-61) in order to realise the advantages of operating with the Rear and Forward Echelons at the same location. At the time of the move, the 36th Machine Records Unit and the Battle Casualty Subsection were involved in a critical period of processing battle casualty reports still being received in great numbers as a result of the German breakthrough in BELGIUM and LUXEMBOURG in December. Because of the short distance involved in the move of the Adjutant General's Section, and because of the undesirability of interrupting battle casualty reporting, the 36th Machine Records Unit and the Battle Casualty Subsection were permitted to remain in the Town of SECH thereby splitting the AG Section. This arrangement continued throughout the remainder of the month of February and proved to work quite satisfactorily. Obviously, it was possible to operate without disadvantage in two locations only because of the lack of close relationship between functions of Battle Casualty reporting and the remainder of the administrative functions performed by the AG Section in particular and the Rear Echelon of the Army Headquarters in general.

For some time it had been noted that the Top Secret Control Subsection was operating with the Adjutant General's Section in the Rear Echelon at a disadvantage by reason of the fact that a large majority of Top Secret papers received at the Army Headquarters pertained to the Forward Echelon alone. Receiving, routing, and accounting for these papers in the Rear Echelon and their physical distribution to elements of the Forward Echelon presented difficulties of transportation and coordination, necessitated unnecessary time lags in the distribution of documents, and increased inherently the danger of loss and compromise of Top Secret papers. To eliminate these difficulties, on 3 February the Top Secret Control Subsection was removed from the Adjutant General's Section near Echelon and incorporated in the Forward Echelon Group of the Adjutant General's Section. Thereafter, more secure and expeditious processing of the majority of Top Secret documents was possible.

As had been previously noted, personnel of the AG Section had never been adequate to accomplish the necessary AG functions under operational conditions, and through the months had been augmented, it was still inadequate in size to perform these functions and at the same time provide reserve capacity to meet emergencies. Such an emergency had occurred when, as a result of the German breakthrough in December, an extraordinarily heavy load of battle casualty reports began to reach the Battle Casualty Subsection in January. The emergency relief in January, when additional enlisted men from depot and divisions were placed on duty in the Battle Casualty Subsection, met part of the temporary measure. These men were returned to their organizations gradually during the period 1 to 10 February and were replaced by nine additional clerks and typists obtained on requisition.

Records Section

SECTION II

CASUALTY SECTION

During February, casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	134	2,309	2,543
Died of Wounds Received in Action	18	281	299
Died of Injuries Received in Action	0	11	11
Seriously Wounded in Action	111	1,700	1,811
Seriously Injured in Action	1	110	111
Slightly Wounded in Action	344	5,183	5,527
Slightly Injured in Action	75	2,345	2,420
Captured by the Enemy	4	0	4
Missing in Action	44	1,797	1,841
Returned to Duty from a Previously Reported Casualty status	190	4,496	4,686
Erroneously reported as Battle Casualties	4	44	48
Totals	925	18,475	19,400

During the same period, fifty sets of personnel records of deceased, missing, missing in action, and captured personnel were processed; fifty-six reports of Investigation, DD Adj Form 71, on non-battle incurred deaths and injuries requiring investigation were reviewed. Non-battle Casualty Reports, DD Adj Form 7, on deceased and missing personnel, as shown below, were cleared by this office:

	Officers	Enlisted Men
Deceased	4	76
Missing	2	11
Totals	6	90

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section were as follows:

Forwarded within:	Percentage
1 - 10 days	35.6%
11 - 20 days	44.2%
21 - 30 days	17.2%
Over 30 days	3.0%

Although in numbers February battle casualty reports were less than half those processed in January, the entire month of February was characterized by long hours of arduous labor in the Battle Casualty Section brought about by the necessity of revising and posting the central battle casualty card file which had fallen, to some extent, in arrears during the hectic days of January and early February.

SECTION III

MACHINE RECORDS UNIT

The European Theater of Operations locator procedure described in Section III, Chapter Eight, of this volume became effective 1 February. Otherwise, for the month, operations were perfectly routine and there was nothing to report.

SECTION IV

POSTAL SECTION

The month of February was marked by a decline in the receipt of parcel post and a slight increase in the receipt of first class mail. Receipt of all classes of mail continued to be irregular.

Arrangements placing trucks at the disposal of the 13th Postal Regulating Section to assist postal installations in transporting mail to their army postal units were discontinued on 28 February.

On 25 February the 13th Postal Regulating Section began operating at KLEINBETTINGEN, LUXEMBOURG (P-60), and the 21st Postal Regulating Section, which had formerly been assisting the 15th Postal Regulating Section, began operating at THIONVILLE, FRANCE (U-68). There was no interruption in postal service during the movement of these units from VERDUN, FRANCE (U-20).

The movement of first class mail by plane from the United Kingdom and from the Base Post Office near PARIS (S-34) to an airstrip near VERDUN was discontinued upon movement of the 13th Postal Regulating Section. Air service was not resumed.

Mail received by the 13th Postal Regulating Section during the month of February was as follows:

First Class Mail

Total number of pouches received - - - 22,342
Daily average number of pouches - - - 933

Parcel Post

Total number of sacks received - - - 141,347
Daily average number of sacks - - - - 5,057

Mail receipts for December and January, as compared with those for February, are as indicated:

First Class Mail

	Pouches Daily Average
December	464
January	702
February	933

Parcel Post

	Sacks Daily Average
December	7,437
January	1,762
February	5,057

CHAPTER 10
MARCH OPERATIONS

SECTION I

GENERAL

Two officers, requested by name for other assignments, were transferred from the Section. Because of the anticipated reorganization under new Tables of Organization, replacements were not requested pending determination of future authorized commissioned strength.

On 11 March, one enlisted man was killed by enemy artillery fire. This was the first death in the Adjutant General's Section during the operation attributable to enemy action.

On the 29th and 30th of March, the Section moved with the remainder of the Rear Echelon from the City of LUXEMBOURG (P-81) to TRIER, GERMANY (L-22). During the months of winter operations, the Section had become, to some extent, habituated to a stabilized situation and excess material had been accumulated. It was felt that the move to TRIER would initiate a phase of rapid movement forward into GERMANY, and therefore every effort was made to jettison all extraneous equipment. There were sixteen 2½-ton truck loads of personnel and equipment remaining at the time of the move from LUXEMBOURG to TRIER.

Despite the change in the nature and tempo of tactical operations in the month of March, there was almost no change in the nature and volume of administrative work during this period.

Because of the imminent entry into GERMANY and the anticipated curtailment of pass privileges, it was desired during March to permit as many officers and enlisted men as possible to avail themselves of pass and detached service privileges. During the month a total of nine officers and nineteen enlisted men went on pass or detached service to the UNITED KINGDOM, to BRUSSELS (J-65), BELGIUM, PARIS, FRANCE (S-Ol), and the United States Recreation Area at CANNES, FRANCE (S-56). In addition, by way of relaxation, three enlisted men were permitted detached service of one week duration with the Army Air Forces.

SECTION II

CASUALTY SECTION

The utility and desirability of hospital Admission and Disposition Reports had been discussed throughout the Theater since the operation started. In some armies good use was made of these reports in verifying battle casualty and non-battle casualty reports (particularly in locating casualties reported as missing in action), while in other armies, little or no use was being made of this report. The form of the Admission and Disposition Report, likewise, varied among the armies. The hospital Admission and Disposition Report was standardized and made an integral part of the battle casualty reporting system by instructions of the Theater Commander on 2 March 1945, issued pursuant to Circular No. 14, War Department, 11 January 1945, which prescribed submission of a standard Admission and Disposition Report from all hospitals and clearing stations throughout the army.

During March, casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	164	2,863	3,027
Died of Wounds Received in Action	27	440	467
Died of Injuries Received in Action	0	8	8
Seriously Wounded in Action	153	1,970	2,123
Seriously Injured in Action	2	62	64
Slightly Wounded in Action	473	8,016	8,489
Slightly Injured in Action	65	1,455	1,520
Captured by the Enemy	0	2	2
Missing in Action	66	2,104	2,170
Returned to Duty from a Previously Reported Casualty Status	212	4,562	4,774
Erroneously Reported as Battle Casualties	0	195	195
Totals	1,162	21,677	22,899

During the same period, 4,582 sets of personnel records of deceased, missing, missing in action, and captured personnel were processed. Non-Battle Casualty Reports, ETO-Cas Form 2, on deceased and missing personnel, as shown below, were cleared by this office:

	Officers	Enlisted Men
Deceased	5	80
Missing	0	9
Totals	5	89

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage
1 - 10 Days	96.68%
11 - 20 Days	2.85%
21 - 30 Days	.25%
Over 30 Days	.34%

SECTION III

MACHINE RECORDS UNIT

In the past, duplications of strength had occurred when individuals evacuated from front line elements to division clearing stations were reported in the strengths of the division clearing stations or comparable medical installations and also carried on the morning reports of their units. To eliminate this difficulty, instructions were issued on 27 March in Circular No. 53, this Headquarters, requiring that patients be dropped from their former organizations if they had not rejoined by the close of the morning report day.

On 27 March, all machine records units attached to Third U. S. Army were relieved from their former assignment to Communications Zone and were reassigned to Third U. S. Army.

SECTION IV

POSTAL SECTION

Receipts of first class mail in March were consistent with receipts in February, but there was a sharp drop in parcel post mail received.

With the mounting tempo of tactical operations, army postal units rapidly moved forward. The 13th Postal Regulating Section closed out at KLEINBETTINGEN, LUXEMBOURG (P-01), and opened up for operations at KIRCHBERG, GERMANY (L-74), the latter part of the month; while the 21st Postal Regulating Section began operations at TRIER, GERMANY (L-22), on 25 March.

In early March all mail, with the exception of certain cars from the ports, was transported to VERDUN (U-26) via the "Foot Sweet" express train from which point it was transferred to Advance Section, Communications Zone trucks and hauled to the two postal regulating sections. However, when the two postal regulating sections moved to GERMANY, transportation was available to transport the mail only as far East as TRIER (L-22). Recommendation was made that all mail be shipped by rail as far forward as possible and that the "Foot Sweet" be extended to the vicinity of BAD KREUZNACH (M-05) or MAINZ (M-35) where it was proposed to locate the postal regulating section. Rail service had not been extended to points recommended by the end of March. In the meantime, mail continued to reach the postal regulating section at TRIER where army postal units called for it. Several army postal units were assisted in transporting their mail over unusual distances by transportation borrowed through efforts of the 21st Regulating Station.

Mail was received by the 13th Postal Regulating Section during the month of March as follows:

First Class Mail

Total number of pouches received - - 26,022
Daily average number of pouches - - 839

Parcel Post

Total number of sacks received - - -117,779
Daily average number of sacks - - - 3,79[illegible]

Mail receipts for January and February, as compared with those for March, are as indicated:

First Class Mail

	Pouches Daily Average
January	702
February	833
March	839

Parcel Post

	Sacks Daily Average
January	5,760
February	5,037
March	3,799

CHAPTER 11
APRIL OPERATIONS

SECTION I

GENERAL

During April the Adjutant General's Section completed two moves, from TRIER (L-22) to FRANKFURT (M-66), and from FRANKFURT (M-66) to ERLANGEN (O-35) -- all in GERMANY. During this time, the Machine Records Unit with the Battle Casualty Section attached made three moves -- from ESCH, LUXEMBOURG (P-70), to BAD KREUZNACH, GERMANY (M-05), from BAD KREUZNACH (M-05) to FRANKFURT (M-66), and from FRANKFURT (M-66) to ERLANGEN (O-35). At FRANKFURT (M-66), the Machine Records Unit and the Battle Casualty Section, which had been separated from the remainder of the Adjutant General's Section since early in February, rejoined the Section and thereafter the entire Adjutant General's Section moved and functioned intact. Throughout the month the Section was established in buildings formerly in use by the Germans as barracks, and personnel was quartered in buildings. An anticipated return to tentage failed to materialize. In all cases more time was required to load and unload the Section and to establish it at each location ready for operations than was required during operations in FRANCE in 1944 when the Section operated entirely in tents.

On 21 April the Adjutant General's Section, in common with the remainder of the Headquarters, was reorganized under revised Tables of Organization and Equipment 200-1 dated 26 October 1944, with Changes 1 and 2 thereto. The new Tables of Organization operated to increase the Adjutant General's Section by four officers, one warrant officer, and thirty-four enlisted men, and made it possible to absorb the Adjutant General's Casualty Section, which had been carried as overstrength, within the authorized strength of the Section. After the reorganization, it became possible for the first time to operate the Adjutant General's Section within its authorized strength.

Battle casualty reports during April dropped to approximately half the number during the preceding month. As a result, work in the Battle Casualty Section was considerably reduced, but this reduction was offset in part by a gradually increasing volume of work in the Personnel and Classification Sections.

SECTION II

CASUALTY SECTION

On 16 April a letter was published to the command, the text of which follows:

"During the advances of the Third U. S. Army across Germany, German prisoner of war Camps and hospitals will be overrun by our forces and inmates liberated. Others, because of confusion and disorder in the zone of our advance, will escape from camps in which held and others will evade capture and return to allied military control.

"It is essential that this personnel be reported to the next of kin or emergency addressee as promptly as possible, and to this end,

Digitized by Google

it is necessary that the required information on which to base such notification be furnished this headquarters with the least practicable delay.

"When units or organizations [illegible] installations, or when individuals [illegible] evaded capture, report to an [illegible] form, which will be reproduced [illegible] vidual or individuals concerned and forwarded to this headquarters through the Battle Casualty Report courier system by the organization concerned. In the cases of Prisoner of War Camps being overrun, the responsibility for completion and forwarding of these forms rests with the commander of the U. S. Forces liberating the camp and not the medical installation furnishing dispensary service.

DECLASSIFIED

"In addition to the immediate rendition of the above reports, the Provost Marshal, this headquarters, will be notified of the location of the camp or hospital overrun and the number of personnel interned therein. A "Stand Fast" order will be enforced pending arrival of the Provost Marshal's representatives and no personnel will be released to their own custody to rejoin their organizations or to make their way to rear areas. Those individuals requiring early medical attention may be evacuated through medical channels after completion of the attached report. In those cases where medical evacuation is accomplished, a statement will be rendered on the Emergency Medical Tag or Field Medical Record that the individual concerned is an Ex-Prisoner of War, Evader, Escaper, or Liberated Internee. In connection with entries to be made on Admission and Disposition Reports, see Section IV, Circular 57, this Headquarters, as.

"These instructions will apply equally to all individuals subject to U. S. Military Law under Article of War 2 and will be thoroughly disseminated to all elements of your command."

The "attached form" mentioned in the above quoted text follows:

"Name _____
Last Name First Name Middle Initial
Army Serial Number Grade Nationality
Former Organization _____
Air or Ground Force _____
Theater of Operations under which your organization was operating at time you were separated therefrom: _____
(ETOUSA, MTOUSA, NATOUSA, etc.)
Date you were returned to Allied Military Control _____
What was your Status: Check one:
Liberated Prisoner of War _____
Escaper from the Enemy _____
Evader from Capture _____
Liberated Military Internee _____
Have you previously filled out a form such as this or similar:
Yes _____ No _____
PW date to be filled out by PW officer, Medical Officer, or their representative.
Is hospitalization necessary? Yes _____ No _____
If hospitalization is necessary, what is the cause therefor:
Battle Wound or Injury _____
Non-Battle Wound or Injury _____
Sickness _____

NOTE: After completion, this form will be forwarded by the most expeditious means to Adjutant General Casualty Division, Headquarters Third U. S. Army, APO 403, U. S. Army."

During April, casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	129	1,779	1,908
Died of Wounds Received in Action	31	220	251
Died of Injuries Received in Action	2	4	6
Seriously Wounded in Action	99	1,124	1,223
Seriously Injured in Action	7	68	75
Slightly Wounded in Action	243	4,034	4,277
Slightly Injured in Action	49	731	780
Captured by the Enemy	1	27	28
Missing in Action	67	1,370	1,437
Returned to Duty from a Previously Reported Casualty Status	109	1,331	1,440
Erroneously Reported as Battle Casualties	5	202	207
Totals	742	[illegible]	[illegible]

DECLASSIFIED

During the same period 11,500 sets of personnel records of deceased, missing, missing in action, and captured personnel were processed. Non-battle Casualty Reports, ETO-Cas Form 2, on deceased and missing personnel, as shown below, were cleared by this office.

	Officers	Enlisted Men
Deceased	2	129
Missing	0	19
Totals	2	148

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage
1 - 10 Days	90.5%
11 - 20 Days	8.7%
21 - 30 Days	.1%
Over 30 Days	.7%

SECTION III

MACHINE RECORDS UNIT

For the month of April, Machine Records operations were routine and there was nothing to report.

SECTION IV

POSTAL SECTION

During April there was a decrease in the receipt of all types of mail. Outgoing mail, particularly parcel post, continued very heavy.

Because of the rapid advance of Third U. S. Army, the 13th Postal Regulating Section was moved from KIRCHBERG, GERMANY (L-74), to MAINZ (M-35) on 1 April. The 21st Postal Regulating Section, then located at THIES (O-22), ceased operations with the Third U. S. Army on 5 April to join another Army.

On 28 April the 13th Postal Regulating Section was moved to PORCHHEIM, GERMANY (O-33), and two days later the "Fast Sweet" express train was extended to WURZBURG (N-65) pending opening of rail to PORCHHEIM (O-33). In the meantime, the mail was unloaded and transported from WURZBURG (N-65) to PORCHHEIM (O-33) by motor transport.

Mail was received by the 13th Postal Regulating Section during the month of April as follows:

First Class Mail

Total number of pouches received - - - 10,969
Daily average number of pouches - - - 653

Parcel Post

Total number of sacks received - - - - 95,728
Daily average number of sacks - - - - 3,191

Mail receipts for February and March, as compared with those for April, are as indicated:

First Class Mail

	Pouches Daily Average
February	833
March	890
April	653

Parcel Post

	Sacks Daily Average
February	5,037
March	3,779
April	3,191

CHAPTER 12
MAY OPERATIONS

SECTION I

GENERAL

From 1 May to 9 May, when active operations terminated, there were no unusual developments in the Adjutant General's Section.

With the end of operations discernible and imminent, there already existed a noticeable trend toward a phase of more voluminous administration. The demand for statistical surveys and other planning reports was increasing, and the center of gravity in all planning was shifting from the support of tactical operations to territorial administration and necessary post-operational readjustments in personnel, equipment, and organization.

SECTION II

CASUALTY SECTION

The most important function of the Casualty Section during this period was the preparation of nominal rolls of liberated prisoners of war. From 1 May to 8 May, the names of 3,606 individuals from German prison camps overrun by Third U. S. Army were reported to the Theater Commander. Procedures established (see Section II, Chapter 11, preceding) for the purpose of obtaining information on which to base nominal rolls functioned smoothly.

During this period, the V Corps was assigned to the Third U. S. Army. As a result of this assignment, 80,000 cards representing casualties suffered by units of the V Corps during Continental operations were received and the immense job of manually interfiling these cards into the already large files of the Casualty Section was begun. This filing of cards was a necessity as there was a considerable and continuous flow of casualty reports, changes in status, letters of condolence, replies to letters of inquiry, and personnel records which had to be processed and verified, and accuracy in processing these documents required accurate and current files. It was anticipated that inquiries concerning casualties would continue to be received for a long time.

During the same period 664 sets of personnel records of deceased, missing, missing in action, and captured personnel were processed. Non-battle Casualty Reports on deceased and missing personnel, as shown below, were cleared by this office.

	Officers	Enlisted Men
Deceased	4	63
Missing	1	3
Totals	5	66

During the first week of May, casualty reports in the following categories were processed:

CATEGORIES	OFFICERS	ENLISTED MEN	TOTALS
Killed in Action	22	232	254
Died of Wounds Received in Action	5	35	40
Died of Injuries Received in Action	0	2	2
Seriously Wounded in Action	20	192	212
Seriously Injured in Action	0	10	10
Slightly Wounded in Action	59	574	633
Slightly Injured in Action	6	123	129
Captured by the Enemy	1	19	20
Missing in Action	6	163	169
Returned to Duty from a Previously Reported Casualty Status	21	485	506
Erroneously Reported as Battle Casualties	1	75	76
Totals	121	1,910	[illegible]

Digitized by Google

The lag between dates of casualty and dates on which completed casualty reports were sent to higher headquarters from the Adjutant General's Casualty Section was as follows:

Forwarded Within:	Percentage
1 - 10 Days	94.00%
11 - 20 Days	4.00%
21 - 30 Days	.50%
Over 30 Days	.50%

SECTION III

MACHINE RECORDS UNIT

On 6 May the 14th Machine Records Unit began formulating plans to enable it to fill its assigned role in the War Department Basic Plan for Readjustment and Redeployment. In addition to records to be prepared for use at the port of embarkation by headquarters European Theater of operations, it was planned that the Machine Records Unit would furnish the following records for use by the Staff of this Headquarters in making readjustments:

Adjusted Service Rating Credit Report by parent unit showing the number of enlisted men within each adjusted service rating score level.

Adjusted Service Rating Credit Report by parent unit showing the number of enlisted men within each military occupational specialty sub-divided within each adjusted service rating score level.

It seemed evident that in addition to prescribed routine operations, the Machine Records Unit would be called upon to play an important part in readjustment and redeployment.

SECTION IV

POSTAL SECTION

Mail was transported via rail "Red Ball Express" to [illegible] and then trucked to the Postal Unloading Section at [illegible] from 1 May to 4 May. On 5 May, rail service direct to the Postal Regulating Section was begun.

An air tonnage allotment of 1½ pounds of mail between Paris (Base Post Office) and Air Strength (Main) at [illegible] (ZZZ), GERMANY (WAF), near the 1st Postal Regulating Section at [illegible] was authorized and transported on 5 May. Thus the Third U. S. Army pioneered the establishment of air mail service to forward areas, thereby expediting the delivery of mail by four to ten days.

Mail was received by the 1st Postal Regulating Section during the first eight days of May as follows:

First Class Mail

Total number of pouches received - - - 9,761 *
Daily average number of pouches - - - 1,220

Parcel Post

Total number of sacks received - - - 45,247
Daily average number of sacks - - - 5,656

(* This total includes pouches received by air.)

Mail receipts for March and April, as compared with those for the first eight days of May, are as indicated:

First Class Mail

	Pouches Daily Average
March	859
April	955
May	1,220

Parcel Post

	Sacks Daily Average
March	3,799
April	5,191
May	5,656

CHAPTER 13
LESSONS LEARNED & CONCLUSIONS

ORGANIZATION

There was much activity in the Top Secret Section during planning phases; little during periods of operation.

The organization of the Forward Echelon Section depends upon the tactical situation and the policies of the Commanding General as to designated functions to be performed in the Forward and Rear Echelons.

The Battle Casualty Section is closely associated in function with the Machine Records Unit. The policy adopted during the "OVERLORD" operation of attaching the Casualty Section and the Army Graves Registration Office to the Machine Records Unit and requiring these three groups to mess, travel, and work together materially facilitated the operational effectiveness of each.

It was desirable to organize a mess in the Machine Records Unit.

The Army Battle Casualty Section should be provided with not less than three officers and twenty-five enlisted men.

The functions of supply, communications, and casualty reporting are sensitive to the tactical attitude, the tempo of operations, and the fluidity of the battle situation. It is desirable to have a reserve of trained personnel within the Adjutant General's Section who can be made available to the several sub-divisions of the Section when emergency situations demand additional manpower.

Tables of Organization 2X-1, dated 26 October 1944, providing a strength of ninety-three enlisted men, five warrant officers, and sixteen officers was found to be adequate for the operation of the Adjutant General's Section of Third U. S. Army.

Whether in bivouac or established in quarters and billets, the size of the Adjutant General's Section with the Machine Records Unit attached is such that it is desirable more often than now to separate physically the Machine Records--Casualty Section groupment from the remainder of the Adjutant General's Section. Moreover, the weight and bulk of the machine records vans is such that it is frequently impossible to place the Machine Records Unit in the immediate vicinity of the Adjutant General's Section proper.

ORGANIZATION IN SUBORDINATE UNITS

The original basis of allotment of one army postal unit per 10,000 of non-divisional troops was found to be inadequate -- the reason being that in addition to troops assigned and attached to the Army proper, large numbers of Communications Zone and Air Force troops in vicinity of army postal units were required to be serviced, thereby adding a considerable overload to the strength of 10,000 theoretically served by the army postal unit.

The Personnel Administration Plan established for the Third U. S. Army at the beginning of the "OVERLORD" operation (see Volume II, Part Seven, Chapter 1, above) proved to be sound. Administration Centers in divisions functioned in a highly satisfactory manner.

EQUIPMENT

It was found that the 1½-ton personnel carrier is inadequate for the transportation needs of any army postal unit.

The sub-allotment of equipment authorized for the Adjutant General's Section at the beginning of the operation was inadequate. It was necessary to obtain additional tentage, typewriters, chairs, and tables to equip the Cables Section and the Battle Casualty Section.

With the functional attachment of the Battle Casualty Section to the Machine Records Unit, it was desirable to obtain a 10-ton semi-trailer van for the Battle Casualty Section in order to give the entire group mobility equal to that of the Machine Records Unit.

During operations, it was necessary that sufficient tentage be made available to house and protect properly the vital card files of the Casualty Section.

At least one high speed, power operated mimeograph machine is an absolute necessity. Two would be preferable. Hand operated mimeograph machines are entirely inadequate to meet the absolute minimum requirements of a field army under any condition encountered during this operation.

TRAINING

Administrative officers and clerks adequately trained for garrison operations of an Adjutant General's Section, if possessing reasonable resourcefulness, should be able to perform similar functions in operations. Additional training is highly desirable, however, for those officers and clerks detailed in the Battle Casualty Section. This training should be conducted by personnel having experience of battle casualty reporting in operations. Wherever possible, officers and clerks from the Battle Casualty Section should be detailed in the Casualty Sections of operating units prior to the commitment of the organizations of assignment. This method was followed by the Adjutant General's Battle Casualty Section at the beginning of the "OVERLORD" operation. It paid dividends.

Schools conducted prior to the beginning of the "OVERLORD" operation, in which personnel officers, clerks, and sergeants major from attached corps and divisions received instructions in battle casualty reporting, procurement of replacements, and other phases of administration (see Volume II, Part Seven, Chapter 1, above), materially standardized and facilitated personnel administration within the Third U. S. Army during the operation.

OPERATIONS

When units are reattached from army to adjacent army, a system for the speedy transfer of machine records files from the old machine records unit to the new machine records unit is essential. The system adopted in the "OVERLORD" operation under which the machine records unit terminating service to an organization assumed the responsibility of transferring by courier, without delay, files to the new machine records unit of service proved to be effective.

Battle casualty reporting channels and channels of evacuation of casualties should coincide from the lowest echelons to the headquarters of the theater of operation. If a casualty report in a given case is rendered by a unit of one army while the casualty himself is evacuated through an adjoining army, much confusion and unnecessary correspondence is caused in each army before the status of the case can be accurately determined in either army.

It is especially important that battle casualty reports be transmitted directly from divisions to the Army Battle Casualty Section without suffering the loss of time necessary for administrative processing at corps headquarters level.

When mail accumulates at any point behind the postal regulating section, the accumulation is likely to arrive at the postal regulating section in very large increments causing heavy peak loads at the postal regulating section. Plans should include the augmentation of the postal regulating section at such times in order to assure the expeditious handling of mail.

Digitized by Google

Constant check is required to ensure that non-divisional troops do not travel too far for mail [illegible] nearer. Troops will endeavor to regi[illegible] and corps command army postal units [illegible]

DECLASSIFIED

General assignment army postal units should [illegible] principal towns having good road nets. Organizations will not register with army postal units located in out-of-the-way places. It is desirable that an army postal unit be located at one place as long as possible and that there should be the minimum disruption of mail service during movement. The leap-frog system of moving army postal units -- i.e., placing a unit as far forward as practicable and leaving it there until it becomes the rear army postal unit -- has proved advantageous.

During fluid phases of field operations when units of army and corps troops are scattered through a deep army area, more effective postal service can be rendered if a majority of the army postal units remain attached directly to Army. When the tempo of operations slows to a relative static phase and corps troops are largely concentrated within corps areas, the postal service can be improved by attaching directly to corps sufficient army postal units to furnish service to the corps.

The practice of having an army postal unit move with the Forward and another with the Rear Echelon of Army Headquarters is desirable, since there are a number of troop units habitually moving with either. Under such circumstances, such troops will always be served by the same army postal unit.

SUPPLY

During highly mobile phases with consequent frequent shifts of depots and supply points and long and frequent movements of units, demands upon supply agencies and channels for high priority items of supply are so great that danger exists of breakdowns in the supply of lower priority items (such as blank forms, envelopes, and mimeograph paper). Adequate stocks of low priority items should be established prior to entering a highly fluid phase in order to assure that supplies in adequate quantity are available for the support of the operation. At least a thirty day level in local reserve is highly desirable.

COMMUNICATIONS

Special courier services utilizing air transportation should be established with caution. During fluid phases of operation, confusion and loss of time incident to establishing contact with the appropriate air strip from each successive bivouac area may be such as to nullify the advantage of speed of transmission in many cases. Greater certainty and equal or greater dispatch may be obtainable through normal ground transmission agencies when short distances are involved.

The special courier system for transmittal of battle casualty reports established immediately prior to the beginning of the operation (see Volume II, Part Seven, Chapter 2) was essential to the procurement of casualty reports and morning reports with a minimum of delay. This, or a similar procedure, is necessary.

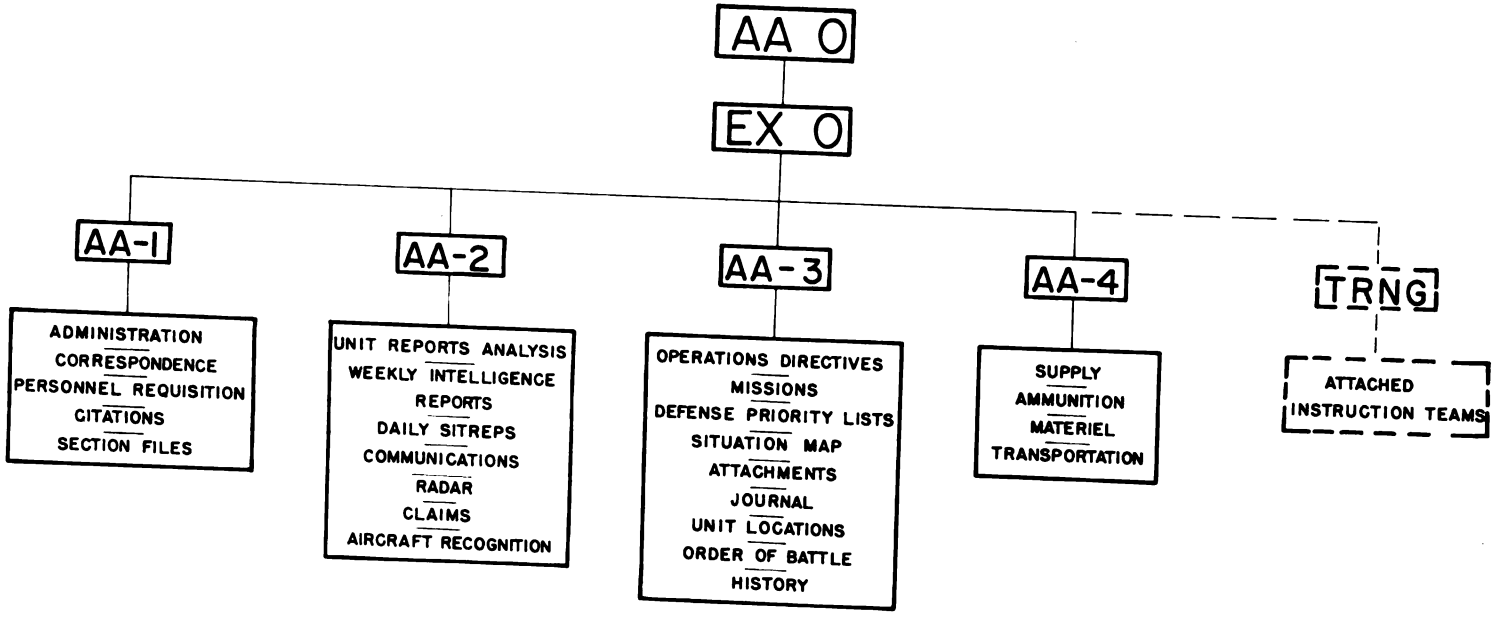
HEADQUARTERS
THIRD UNITED STATES ARMY
Antiaircraft Section
APO 403

SUBJECT: Submission of After Action Report.

TO : Commanding General, Third US Army, APO 403, US Army.

1. Submitted herewith is the After-Action Report of the Antiaircraft Artillery Section, Headquarters Third US Army, beginning with the time of arrival of this section at Camp Toft, Cheshire, England on 24 March 1944, and continuing at the properly designated intervals by chapters until the cessation of hostilities with Germany.



2. The report covers mainly the activities of Antiaircraft Artillery units directly under Army control which were employed to defend lines of communications, supply points and vital areas in both the Army area and in the Corps areas. However all outstanding or unusual instances concerning Antiaircraft Artillery units attached to Corps and Divisions are included. In addition, the attached annexes summarize the activities of all Antiaircraft Artillery in the Third US Army.

F. R. CHAMBERLAIN, JR.
Colonel, CAC,
Antiaircraft Officer.

CHAPTER 1
PLANNING IN UNITED KINGDOM

During the planning phase in the United Kingdom, Antiaircraft Artillery units were assigned to Third US Army in accordance with the following estimate of requirements which had been made by Headquarters European Theater of Operations:

Per Division	-	1 AAA AW Bn
Per Corps	-	1 AAA Group Hq & Hq Btry 1 AA Gun Bn 2 AAA AW Bns
Per Army	-	1 AAA Brigade Hq & Hq Btry 3 AAA Group Hq & Hq Btrys 2 AAA Gun Bns 6 AAA AW Bns

On the above basis and with a designated strength of four corps, the total amount of Antiaircraft Artillery assigned or "earmarked" for assignment to Third US Army consisted of one Antiaircraft Artillery Brigade Headquarters and Headquarters Battery, seven Group Headquarters and Headquarters Batteries, six Antiaircraft Artillery Gun Battalions and twenty five Antiaircraft Artillery Automatic Weapons Battalions.

Few of the above units were released to control of Third US Army during the planning stage. Many were attached to First US Army and participated in the assault on the Continent and ensuing operations during the months of June and July. Others were attached to European Theater of Operations and the Ninth US Air Force for defense of installations in England. Information concerning the probable use of flying bombs by the Germans resulted in the retention of Antiaircraft Artillery units on operational assignments until they left for the Continent, instead of earlier release to Third US Army in the United Kingdom as had been planned. Two units were attached to the Advance Section Communications Zone.

As a result of the above detachments, two Group Headquarters and Headquarters Batteries, five Antiaircraft Artillery Gun Battalions and twelve Antiaircraft Artillery Automatic Weapons Battalions did not revert to Third US Army control until after arrival on the Continent.

Those units which were released to Third US Army in the United Kingdom were "Phased" on the troop priority list. Arrangements were made to pick up units attached to First US Army and Advance Section Communications Zone on the Continent in time for operations with the divisions, corps, or army unit for which earmarked.

With the exception of units attached to First US Army, all Antiaircraft Artillery units assigned Third US Army in the United Kingdom, were inspected by officers from the Army Antiaircraft Section and 34th Antiaircraft Artillery Brigade to determine their status of training and equipment. Antiaircraft artillery units which had been released to Third US Army were sent to Antiaircraft practice ranges in England for refresher and familiarization firing. The one gun battalion released to Third US Army was attached to VIII Corps and sent to a Field Artillery range for instruction and firing in a Field Artillery role under the supervision of Field Artillery officers.

Operations memoranda were published which outlined the responsibilities of the Field Artillery and Antiaircraft units and procedure to be employed when Antiaircraft units were used to reinforce Field Artillery fire. Existing graphic firing tables for terrestrial firing by 90mm guns were found to be based on obsolete firing tables and to contain no information on the M-67 Field Artillery fuse when used with the 90mm shell. Since it was essential to know the difference between fuse range and time of flight when using this fuse on the 90mm shell, a study was made of the characteristics of the M-67 fuse on the 4.5 inch and 155mm Field Artillery projectiles and an approximate scale developed for its use with the 90mm projectile. A Graphic Firing Table based on revised firing data and including information for use of both the M-43 and M-67 fuses for time fire was developed, produced, and distributed to all Antiaircraft Artillery Gun Battalions assigned to Third US Army.

Quotas for special schools for Antiaircraft Troops in the United Kingdom were allotted to units in accordance with their priority for movement to the Continent. These schools included Care and Maintenance of Materiel, Antiaircraft Dive Bombing Tactics, Waterproofing of Vehicles and Equipment, Deployment and Movement of Antiaircraft Artillery Automatic Weapons Battalions, Camouflage and Mines and Booby Traps.

An operations memorandum covering the Air Defense System, Employment of Antiaircraft Artillery, Rules for Antiaircraft Engagement and Limitations to Flying was published. Other operations memoranda were published which included the procedure to be used in obtaining meteorological messages by using the Antiaircraft Artillery Gun Battalion radars to obtain ballistic winds (Rawin Process). This data was combined with ballistic densities obtained by radiosonde at the Army weather detachment. Types 1, 2 and 3 meteorological messages were known to be transmitted to all units in the Army desiring this information. An Antiaircraft Bulletin was published outlining the use of demolitions for blasting gun emplacements.

Plans were made for an air warning system for the Army area. The 11/7th Operations Detachment was activated and attached to the 34th Antiaircraft Artillery Brigade to operate an Antiaircraft Artillery Operations Room for the Third US Army area.

Since the employment of Third US Army in the coming operations depended on the situation at the time it became operational, no definite plans for employment of Antiaircraft Artillery could be published. The Antiaircraft Artillery Annex to the Third US Army Outline Plans outlined the basic air defense plan and air defense measures which would be employed. It also included an estimate of the initial vulnerable points in case of an amphibious landing, and other points which would become vital Army objectives. A general plan was outlined for control and employment of all Antiaircraft Artillery troops, Barrage Balloons, and Smoke Screens in the Army Zone and instructions were included covering such matters as aircraft identification and recognition, ammunition loads, handling of captured material and local security.

A close check was maintained on the status of equipment of units, and, where necessary, special efforts were made to facilitate the drawing of critical items of equipment.

A study was made of Third US Army administrative instructions preliminary to mounting and their application to Antiaircraft Artillery units. Computations were made to determine that units would be loaded as specified in these instructions and to ascertain that Antiaircraft Artillery battalions were sufficiently mobile to meet the requirements of the coming operations. A study was also made of ammunition maintenance requirements for the period up to "D" plus 10A and recommendations made to Army Ordnance Officer.

Training was also conducted for Third US Army units other than Antiaircraft Artillery. A training memorandum prescribing practice Antiaircraft firing for .50 caliber guns was published, and facilities at practice camps in England were obtained for training of .50 caliber machine gunners of ground units other than Antiaircraft Artillery. A quota of two gunners per caliber .50 machine gun was allotted to all Third US Army units. Officers of units which were to participate in this training program were sent to the practice camps one week in advance of the enlisted gunners for intensive training under the supervision of British Antiaircraft personnel to qualify them as instructors for their own troops. Approximately 1400 officers and 10,000 enlisted men from Third US Army received this training. In addition, a letter directive was published outlining the rules for firing of small arms at enemy aircraft and another for fire at hostile aircraft with Antiaircraft weapons by other than Antiaircraft Troops.

Upon departure of Third US Army Headquarters from England, an echelon from the Antiaircraft section remained with the "T" echelon to complete this program of machine gun firing and also to assist in equipping the Antiaircraft units assigned to Third US Army which were still in the United Kingdom.

CHAPTER 2
PRE-OPERATIONAL ON CONTINENT

Upon arrival on the Continent, contact was established with the Antiaircraft Section, First US Army and the plans and procedures set up for operations of Third US Army Antiaircraft units were checked for adequacy in the light of battle experience. This contact was maintained throughout the pre-operational phase.

Additional operational memoranda were published, one of which covered the employment of aircraft by ground forces other than Antiaircraft Artillery and another the designation of Antiaircraft Artillery Intelligence Service reporting stations.

The plans for employment of Third US Army were still indefinite at this time but port installations along the BRITTANY coast and the west coast of FRANCE were studied and plans prepared for antiaircraft defense of those installations.

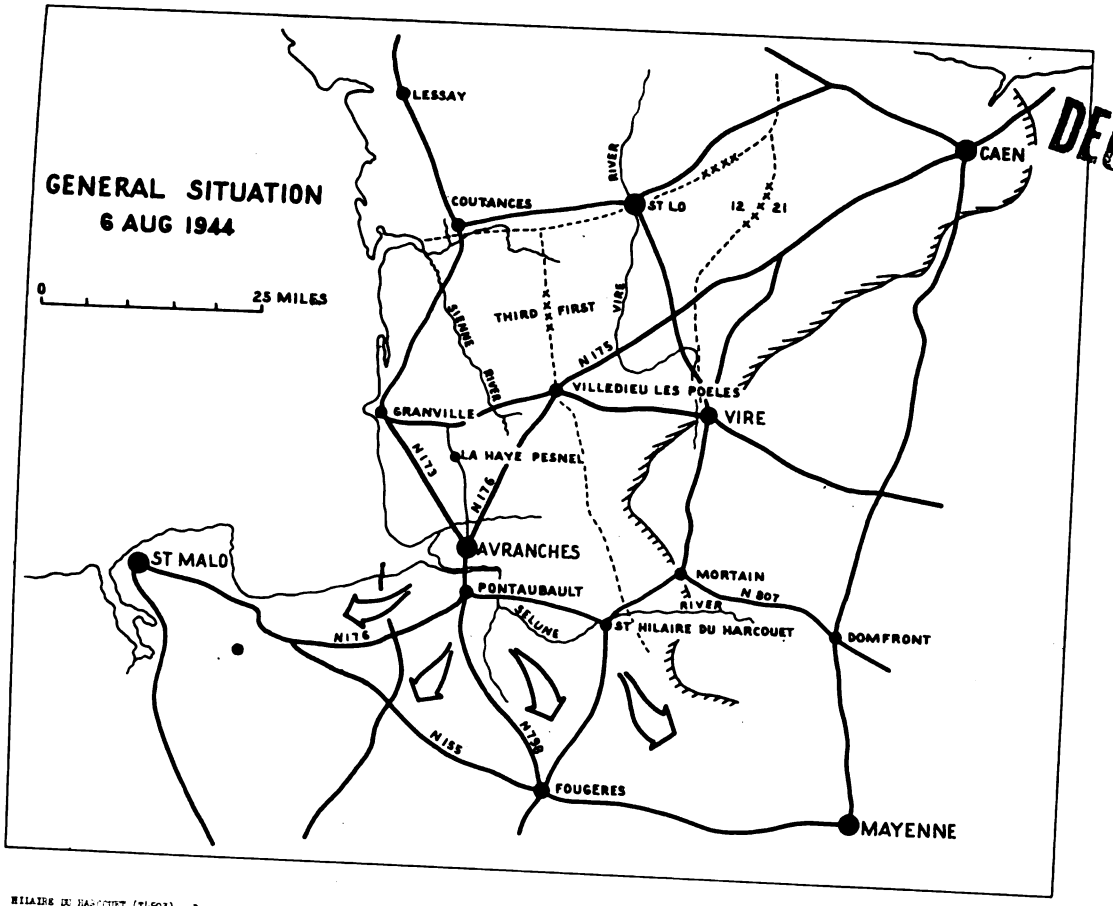
Inasmuch as the majority of the Antiaircraft units assigned Third US Army were still operational with First US Army and Communications Zone, a constant check was maintained on the location, availability and status of equipment of these units, and arrangements were completed for these units to be released to Third US Army when it became operational.

Until the latter part of this period, when the needs of First US Army for Antiaircraft Artillery had been satisfied, Third US Army Antiaircraft units arriving on the Continent continued to be attached to First US Army for operations. Thereafter, arriving Third US Army units became available for its own protection. These were utilized to establish Antiaircraft defense of the Army Command Post and supply installations in the vicinity of ST JACQUES DE RAMOU (T2800). As units continued to arrive, sufficient Antiaircraft Artillery was attached to the XV Corps to protect its concentration.

CHAPTER 3
AUGUST OPERATIONS

On 1 August the Army had one Antiaircraft Artillery Brigade, seven Antiaircraft Artillery Groups, six Antiaircraft Artillery Gun Battalions, eight Antiaircraft (Self-propelled) Battalions and seventeen Antiaircraft Automatic Weapons Battalions assigned or earmarked for assignment. The majority of these units had been attached to First US Army for operations and arrangements were made to secure their immediate release.

In accordance with previous plans, an Automatic Weapons Battalion was to be attached to each division, and an Antiaircraft Artillery Group Headquarters, one Antiaircraft Gun Battalion and two Antiaircraft Artillery Automatic Weapons Battalions to each corps. The remainder of the Antiaircraft Artillery in the Army was to be attached to the 34th Antiaircraft Artillery Brigade. The Brigade with its attached units was to perform the mission of protecting installations in the rear of corps zones. When necessary, additional Antiaircraft units required to augment corps defenses would be furnished from Antiaircraft Artillery units attached to the Brigade.



Until Third US Army became operational, the mission of the 34th Antiaircraft Artillery Brigade was defense of Third US Army Headquarters and supply installations in the vicinity of ST JACQUES DE RAMOU (T1800).

After United States forces had broken through the German shell between LESSAY (T1677) and ST LO (T5043), driven on down the Contentin Peninsula and fanned out into BRITTANY, a line of communications "funnel" was formed in the region of AVRANCHES (T2718) - PONTAUBAULT (T2810) - ST HILAIRE DU HARCOUET (T4503). Referring to Figure 1, it can be seen that the only north-south supply road through this area, N-176, crosses the SELUNE River and passes through numerous defiles including the towns of AVRANCHES (T2718) and PONTAUBAULT (T2810). The area also included several bridges on the east - west supply roads, and a dam on the SELUNE River, the breaching of which would flood the area and jeopardize the successful exploitation of the break through. Several supply points were within the area and two airstrips were in operation. In short, the area contained numerous enticing targets to lure maximum effort from the German bomber force.

As the VIII Corps moved south, Army Antiaircraft Artillery units under the 34th Antiaircraft Artillery Brigade were moved in rear of the corps with the mission of protecting bridges southeast of COUTANCES (T2457) and in the vicinity of HYENVILLE (T2251) and other salient points along the route of advance with particular attention to LA HAYE PESNEL (T2928) and SARTILLY (T2424). Efforts were continued to secure release of Third US Army Antiaircraft Artillery units still attached to other headquarters in order that they might be brought south to build up the defense of critical points along the supply route, and plans were made to extend Army Antiaircraft Artillery defenses south through the gap at AVRANCHES (T2718) and east along the SELUNE River.

By 3 August, Antiaircraft Artillery units released by the First US Army had moved south to develop defenses extended through the gap at AVRANCHES (T2718) and west toward the BRITTANY Peninsula to include PONTORSON (T1703) and PONTAUBAULT (T2810). Defense of the SELUNE River with 90mm guns was extended east from the mouth of the river to ST

Digitized by Google

DECLASSIFIED

HILAIRE DU HARCOUET (TL503). Due to the extreme importance placed upon keeping the AVRANCHES (TQ7718) gap open to allow an uninterrupted flow of supplies for the rapid advance, arrangements were made to establish the area bounded by a line 12,000 yards north and south of the river and 12,000 yards west of its mouth and east of ST HILAIRE DU HARCOUET (TL503) as a restricted area called an Inner Artillery Zone (IAZ). In this area at night only, antiaircraft Artillery was authorized to immediately engage any plane not identified as friendly, as compared with the normal restricted area in which only those planes which committed a hostile act were positively recognized or identified as enemy, could be engaged.

Automatic Weapons protection was also provided for the airstrips at ST JEAN DE DAYE (TL776) and MEAUTIS (TS62) with a minimum scale of one (1) Automatic Weapons Battery at each strip.

By 4 August all Antiaircraft Artillery had been received by Third US Army with the exception of the 486th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) which was scheduled to arrive on the Continent shortly, and the 484th Antiaircraft Artillery Automatic Weapons Battalion, attached Section 3-th Infantry Division which was still operational with the First US Army. The 484th Antiaircraft Artillery Automatic Weapons Battalion was released to Third US Army when the 8th Infantry Division reverted to Third US Army

Attachments and assignments of Antiaircraft Artillery units as of 4 August are indicated below:

38th AAA Brigade

(347th Opns Det)

97th AAA Group

128th AAA Gun Bn
482d AAA AW Bn

551st AAA AW Bn

• Temp attached
•• Not operational

The above attachments marked a change from the original plan for permanent attachment of one gun battalion to each corps, with the retaining two gun battalions attached to Army. It had been decided that this system would not allow sufficient flexibility for building up gun defenses and also maintaining such defenses as the corps moved forward.

The new plan was to keep all gun battalions under Army control and attach them to corps as necessary. As the corps moved forward, the gun battalions would remain in position and revert to Army control. Protection of defiles or installations further along the corps zone of advance would be provided by moving up other gun battalions from the rear of the army area and attaching them to corps.

This method of "leap frogging" proved very successful in that gun defenses could be established as necessary throughout the Army area without respect to Corps zones and continuous protection could be provided to bridges and other critical points along the main supply roads.

By 4 August enemy action was becoming increasingly heavy. Fierce air attacks were being made in an effort to interrupt the movement of troops and supplies through the AVRANCHES (TQ7718) gap. During the period 031200B - 041200B August the enemy sent over 467 aircraft in ninety seven raids. Antiaircraft claimed twenty nine planes as destroyed and twenty as probably destroyed.

When it became evident that RENNES (XS4148) would fall to the rapidly moving Third US Army columns, arrangements were made for the city to be declared an Inner Artillery Zone by night as soon as possible or upon capture. The restrictions to flying were to apply to the area enclosed within a circle having a radius of 15,000 yards, the center of which would be RENNES (XS4148).

During the period 041200B to 051200B the enemy made 107 raids employing 203 aircraft. Antiaircraft units made claims for fifteen Category IIs (destroyed) and eight Category IIIs (probably destroyed) with no defence to defenses. All available Antiaircraft Artillery was required to cope with these efforts and

Digitized by Google

By 6 August the AVRANCHES (T2718) defenses were built up to a maximum of seven and one half battalions, disposed as shown in Figure 2 and organized as follows:

<u>29th AAA Brigade</u>

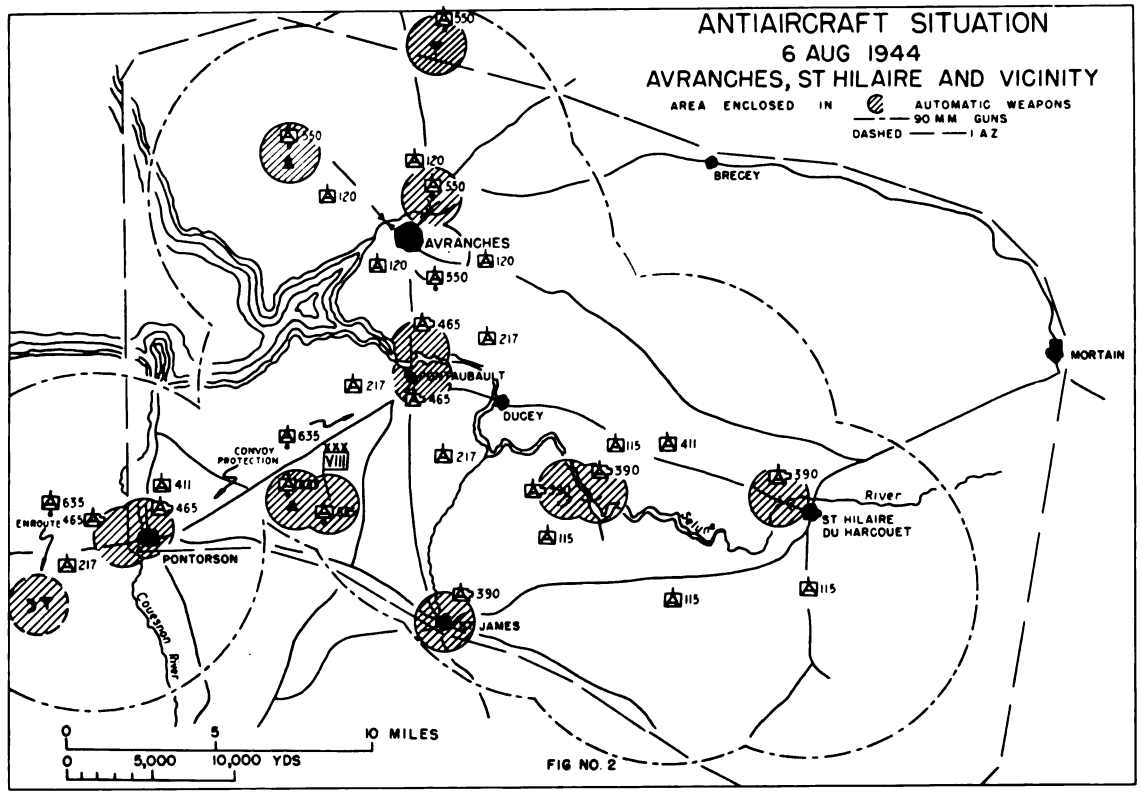
207th AAA Group
(1) 217th AAA Gun Bn (M)
(Btry "A", 111th Gun Bn attchd)
(2) 115th AAA Gun Bn (M)
(Btry "C", 111th Gun Bn attchd)
(3) 502nd AAA AW Bn (SP)
(4) 465th AAA AW Bn (SP)

<u>214th AAA Group</u>

(1) 120th AAA Gun Bn (M)
(2) 550th AAA AW Bn (M)
635th AAA AW Bn (M) - (Attchd VIII Corps)

The effort expended by the German Air Force against this vital area was indicative of the seriousness with which the enemy viewed the effect of the breakthrough. Enemy fliers made repeated determined attempts to breach the dam, destroy the bridges, and otherwise interfere with the movement of men and supplies through the "funnel". Heaviest attacks occurred on the night of 6 August, when 263 aircraft were reported over the AVRANCHES (T2718) area. Antiaircraft artillery claimed 10 enemy planes destroyed and fourteen probably destroyed. Of the 5 assigned VIII Corps Antiaircraft Artillery and Divisional Antiaircraft Artillery units claimed an additional 2 for planes destroyed and 2 probably destroyed. The XV Corps and Divisional Antiaircraft Artillery claimed five Category I's and three Category II's. The enemy planes operated almost exclusively at night. A bright moon during the period was of considerable assistance to Automatic Weapons units, which were able to engage during the hours of darkness. Planes attacked singly, or by small groups. Extensive use was made of flares. Types of attack included medium level and glide bombing, using heavy demolition and anti-personnel bombs, as well as strafing attacks. At times, attacking planes came low enough to be silhouetted against the flares of burning buildings and trucks, thereby presenting good targets for the automatic weapons.

Arrangements were completed on 6 August for the attachment of two additional Antiaircraft Artillery Brigades to Third US Army. Plans were made for the 52d Antiaircraft Artillery Brigade to be used in the defense of St. MALO (S7915) and RENNES (X9448), and the 54th Antiaircraft Artillery Brigade in the defense of BREST (V9090) immediately upon capture of these cities.



Arrangements were made for the establishment of MAYENNE (Z8171) and LAVAL (Y6060) as Inner Artillery Zones for protection of bridges at these places, since efforts of the German Air Force were being directed largely against lines of communication in the attempt to stop the rapid movement of Third US Army. This made imperative immediate Antiaircraft Artillery defense of bridges and other critical points as soon as they were secured by our troops. To protect the crossing of the ERVENNE River at LAVAL (Y6060), the 120th Antiaircraft Artillery Gun Battalion was detached from the MAYENNE River defenses and moved in the late afternoon to the vicinity of LAVAL (Y6060) for employment by XV Corps. A Chemical Smoke Company was also attached to XV Corps and moved to LAVAL (Y6060) to augment the Antiaircraft defenses there.

In order that the defenses along the SELUNE River south of AVRANCHES (T4716) and east of PONTAUBAULT (T2610), which were still receiving heavy raids nightly might not be weakened, the two batteries of the 111th Antiaircraft Artillery Gun Battalion which had been protecting bridges in the vicinity of COUTANCES (T2157) were moved south to maintain the defenses in the critical area.

The XV Corps became operational on 7 August. Initially the 13th Antiaircraft Artillery Group, Headquarters and Headquarters Battery and the 551st Antiaircraft Artillery Automatic Weapons Battalion were attached as corps units. Several days later the 105th Antiaircraft Artillery Automatic Weapons Battalion was also attached. The 387th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) had been attached to XX Corps for the 5th Armored Division and the 449th Antiaircraft Artillery Automatic Weapons Battalion for the 5th Infantry Division.

On 7 August, responsibility for the Antiaircraft Artillery defense of RENNES (X9448) was taken over from VIII Corps by Army, and the Gun Battalions which were defending RENNES (X9448) were attached to the 38th Antiaircraft Artillery Brigade.

A change in the boundary between armies placed MAYENNE (Z8171) in the First US Army zone of action and XV Corps was relieved of responsibility for defense of that city. This enabled the 120th Antiaircraft Artillery Gun Battalion which had been defending both LAVAL (Y6060) and MAYENNE (Z8171) to augment the defense of LAVAL (Y6060).

The 52d Antiaircraft Artillery Brigade consisting of the 19th Antiaircraft Artillery Group, 449th Antiaircraft Artillery Gun Battalion (semi-mobile), and the 467th Antiaircraft Artillery Automatic Weapons Battalion (semi-mobile), which had been attached to Third US Army, moved west on the 6 August Peninsula with orders to be prepared for movement into BREST (V9090) to organize Antiaircraft defense of that city immediately upon capture. In the meantime the brigade was directed to set up a defense of airfields on the main supply route between LAUDEAC (Z2166) and ROSTRENEN (W8176).

The heaviest air activities since Third US Army began its move to the south occurred during the period 6 - 7 August. Most of the raids were on bridges and critical points in the vicinity of AVRANCHES (T2718) and ST HILAIRE DU HARCOUET (TL703). The rapid build-up of Antiaircraft defenses provided protection for all critical areas, however and even though the German Air Force made repeated attempts to slow up the operations by attacking these objectives in force, not a single defended installation was reported destroyed or damaged. Of the 534 enemy planes reported over the Army area during the 48 hour period, more than ten percent were destroyed or probably destroyed by Antiaircraft Artillery.

Due to the rapid movement of Third US Army both to the east and west it became apparent that the city of RENNES (X9448) would be of less importance than had been anticipated. Defense of the city was reduced by one Gun battalion, and the 467th Antiaircraft Artillery Gun Battalion was moved east to LE MANS (WL979) and attached to XV Corps to protect its crossings over the SARTHE River. Here an Inner Artillery Zone was established on 9 August.

By this time, the extremely heavy enemy activity in the AVRANCHES (T2718) and SELUNE River area had begun to decline, but scattered enemy raids were still being reported throughout the Army area.

Antiaircraft defense of the main supply route through LAVAL (Y6060) and LE MANS (WL979) now began to assume great importance as the advance continued to the north and east and additional Automatic Weapons units were attached to XV Corps for this purpose. As the corps moved rapidly to the north, Antiaircraft defenses at LAVAL (Y6060) were taken over by Army. In accordance with the policy which had been established, Antiaircraft Artillery units defending the city reverted to Army control and were attached to the 38th Antiaircraft Artillery Brigade.

Digitized by Google

On 10 August enemy air action reached the lowest ebb since Third US Army became operational. Only thirty one enemy planes were reported over the entire Third US Army area during the twenty four hour period.

Army supply lines continued to stretch and transportation became a critical problem. To assist in meeting the increasing demands, arrangements were made for Antiaircraft Artillery units under the control of Army Groups to furnish vehicles for hauling supplies provided such action would not hinder the units in the performance of their primary mission. Vehicles taken from these units which were not expected to be used for 24 hours and the vehicles were placed at the disposal of the Army Transportation Section for this period to bring up the needed supplies. 36th Antiaircraft Artillery Brigade organized such transportation into the equivalent of truck companies under the control of one of the Antiaircraft Artillery Groups. With the exception of a few instances, movement of Antiaircraft units was not affected adversely by the temporary loss of these vehicles, since definite control was retained so that the vehicles could be recalled if an Antiaircraft Artillery unit received orders for movement sooner than had been anticipated.

The Army area was now so large that it became impossible to continue the protection of rear installations and also to cover the forward areas of the swift advances. A request was therefore made to Twelfth US Army Group for the attachment of additional Antiaircraft Artillery to Third US Army. Units were not available for this purpose, but to relieve the situation, arrangements were made through Twelfth US Army Group for First US Army to take over Antiaircraft defense of the crossings of the ORNE and SEULNE Rivers from the coast to ST HILAIRE DU HARCOUET (TJ503), the dam on the SEULNE River near DULCY (T3603) and critical points on supply routes north of the SEULNE River. Third US Army was to supplement those defenses south of the SEULNE River. Third US Army units relieved from the SEULNE River defenses were to protect airfields which had become operational in the Army area, and to cover supply installations and critical points in the forward part of the Army area.

The 111th Antiaircraft Artillery Gun Battalion was released from the SEULNE River defenses on 13 August and was attached to the XV Corps for the protection of the city of ALENCON (Z33Ø4). The vital crossroads in this city formed a bottleneck in the advance of the XV Corps and ALENCON (Z33Ø4) was declared an Inner Artillery Zone by night. Other units relieved from the SEULNE River defense moved forward to protect Class III and V supply points in the vicinity of LAVAL (YØ6Ø) and LE MANS (VL979) as well as the river crossing at LAVAL (YØ6Ø) and Army took over from XV Corps, responsibility for protection of LE MANS (VL979).

On 13 August the XII Corps became operational and the 7th Antiaircraft Artillery Group and 452d Antiaircraft Artillery Automatic Weapons Battalion were attached as Corps Antiaircraft. The 489th Antiaircraft Artillery Automatic Weapons (Self-propelled) Battalion was also attached to XII Corps for further attachment to the 4th Armored Division.

Violent enemy activity such as experienced along the SEULNE River had now been reduced to sporadic attacks throughout the Army area.

Information was received that the railroads leading into LE MANS (VL979) from the CHERBOURG Peninsula were being opened for the purpose of bringing in supplies. Class III supplies had become especially critical at this time. Due to the limited capacity of railroad yards in the city of LE MANS (VL979) and the problem of unloading and routing, it was anticipated that the trains would be held on sidings northwest of LE MANS (VL979) and as far back as SILLE (Z1757) and CONLIE (Z2149). Plans were therefore made for a flexible Antiaircraft defense which could be adjusted as necessary.

By this time RENNES (XØ448) was so far to the rear of the front lines that it was no longer of importance to Third US Army. Its defense was discontinued and the 119th Antiaircraft Artillery Gun Battalion was moved west to be available for protection of ORLEANS (W6540) upon capture. Arrangements were made for the establishment of Inner Artillery Zones at ORLEANS (W6540), CHATEAUDUN (W2461), BLOIS (Y2188) and NOGENT LE ROTROU (V8893), all of which contained either important river crossings or road junctions in the broad path of the Third US Army drive. Of these, BLOIS (Y2188) later proved to be of no importance and plans for its defense were discarded.

By 16 August the importance of the installations requiring antiaircraft protection in the vicinity of LE MANS (VL979) had increased greatly, due to the extension of the railroad system to the east. The last gun battalion remaining in the SEULNE River defenses was therefore moved to LE MANS (VL979) to augment the Antiaircraft Artillery defenses there. Both 90mm gun and Automatic Weapons defenses were extended from LE MANS (VL979) to the West and provided protection not only for the unloading points in LE MANS (VL979) and the supply dumps in the area, but also for the trains waiting west of the city until they could be moved into LE MANS (VL979) and unloaded. Two Automatic Weapons battalions were given a "roving" mission of protecting such concentration of trains as they arrived at waiting points on the tracks Northwest to CONLIE (Z2149) and SILLE (Z1757).

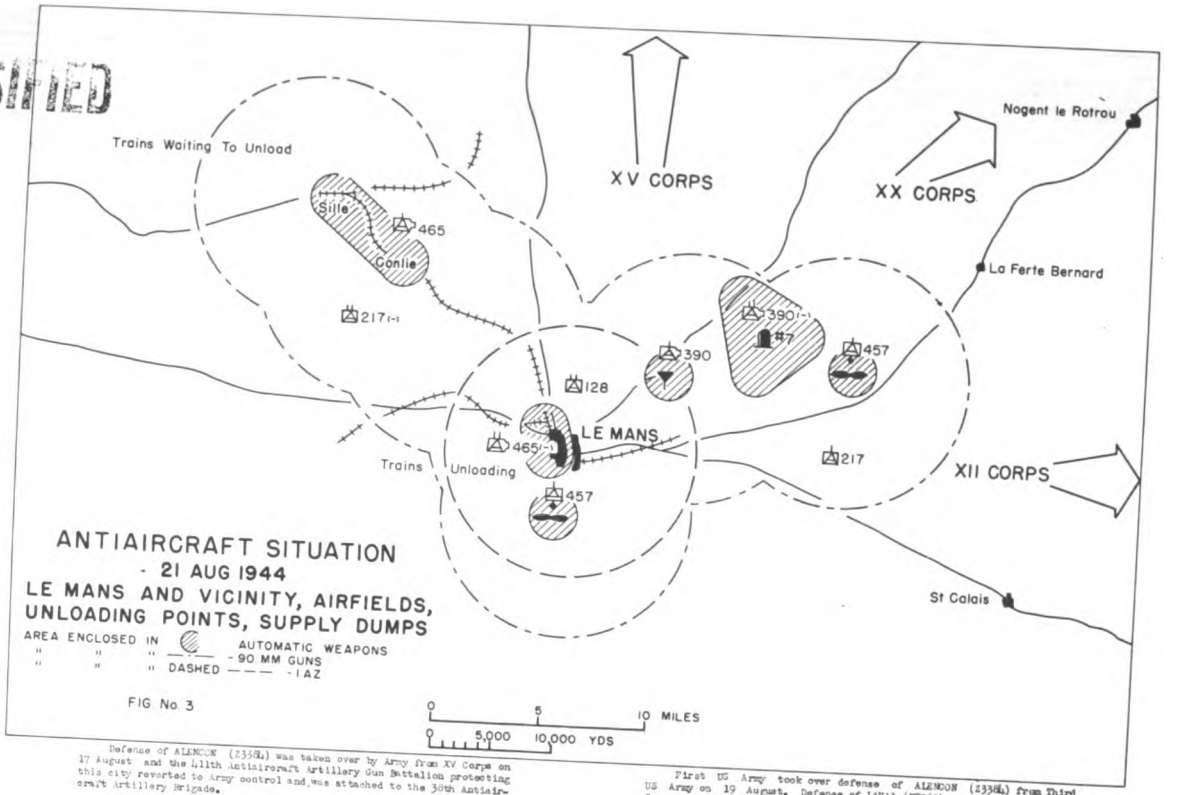


FIG. No. 3

Defense of ALENCON (Z33Ø4) was taken over by Army from XV Corps on 17 August and the 111th Antiaircraft Artillery Gun Battalion protecting this city reverted to Army control and was attached to the 38th Antiaircraft Artillery Brigade.

The tempo of enemy air attacks now began to increase. Between 1000S and 1930S on 16 August, the 270th and 99th Field Artillery Battalions, protected by two batteries of the 456th Antiaircraft Artillery Automatic Weapons Battalion, were attacked by thirteen enemy aircraft. Of these planes, nine were chalked up as destroyed. This action marked the beginning of a determined attempt by the enemy to strike at our forces which now had overheads only nine miles from the outskirts of PARIS (8Ø545). Enemy air activity became more intense than at any time since the heavy attacks along the SEULNE River during 6 - 7 August.

The fall of ORLEANS (W6540) to XII Corps appeared imminent and the 119th Antiaircraft Artillery Gun Battalion which had been held in readiness for defense of the city upon capture was attached to the corps.

Information was received from the Assistant Chief of Staff, G-4, that cargo planes would begin to use two airstrips in the vicinity of LE MANS (VL979) for the unloading of gasoline on 18 August. Antiaircraft Artillery defenses were immediately adjusted in order to protect airstrips, and two batteries of the 467th Antiaircraft Artillery Automatic Weapons Battalion were brought forward from LAVAL (YØ6Ø) to augment the defenses in the vicinity of LE MANS (VL979).

First US Army took over defense of ALENCON (Z33Ø4) from Third US Army on 19 August. Defense of LAVAL (YØ6Ø), which was now in the Communications Zone, was discontinued the same date and the Third US Army Antiaircraft Artillery so relieved, moved forward to protect critical points and supply installations in the vicinity of CHATEAUDUN (W2461) and VENDOME (PØ511). Arrangements were made to establish VENDOME (PØ511) as an Inner Artillery Zone.

Third US Army units were now driving ahead to secure the line of the SEINE both above and below PARIS (8Ø545). In order to protect anticipated crossings of the SEINE River, arrangements were made to establish Inner Artillery Zones at MELUN (S2705), MONTEREAU (X3195) and SENS (Z6Ø6Ø). On 20 August, Inner Artillery Zones were placed into effect at MANTES-GASSICOURT (R6161), CHARTRES (H38Ø4) and ETAMPES (W8897).

The 120th Antiaircraft Artillery Gun Battalion was detached from Army and attached to the XX Corps to furnish protection for the crossings planned in the Corps Zone. The XV Corps already had the 111th Antiaircraft Artillery Gun Battalion under its control.

On 21 August, enemy air activity which heretofore had been confined almost exclusively to night attacks suddenly changed, with the Luftwaffe making its appearance in daylight sorties, especially in the vicinity of the XV Corps crossing north of MANTES-GASSICOURT (R6161). Here planes attacked repeatedly, strafing, bombing and firing rockets in an attempt

DECLASSIFIED

Digitized by Google

to destroy the bridge constructed by the engineers. When the scare was revealed, one Antiaircraft Artillery gun battalion and two Automatic Weapons battalions claimed to have destroyed twenty five planes and probably destroyed six more, but in spite of the vicious and repeated attacks, Antiaircraft Artillery had succeeded in its mission of defending the vital bridge.

Although the Germans had demonstrated, by their efforts against the bridgehead north of MANTES-GASSICOURT (R6161), that they were still capable of large scale raids, little attention was paid by the Luftwaffe to the targets at LE MANS (VL979). By 21 August the importance of LE MANS (VL979), as a supply point, had increased with the further progress of the Army, north, northeast and east. In addition to the accumulation of materiel which had been brought by truck, freight trains were dispatched from the beaches to LE MANS (VL979) for unloading. Marshalling yards there were unable to accommodate such incoming trains with the result that the track from SILLE (Z1757) to COSLIE (Z2649) was lined with cars. The yards at LE MANS (VL979) hummed with activity as the unloading of much needed supplies went on. Besides this unusual rail activity, supplies were being continuously flown in by cargo planes. Two airfields, a large Army Supply Point, one Class III dump, the railroad terminals, roads and bridges in LE MANS (VL979) comprised the defended installations. Dispositions of Antiaircraft Artillery were as shown in Figure 3. While frequent reconnaissance flights over the area and some strafing was reported, no major attack against the objectives ever materialized.

In the XV Corps zone, however, the numerous and determined daylight assaults against the bridges over the SEINE continued. The high point of the enemy attack was reached by 22 August. Established by the 79th Infantry Division, the bridgehead over the SEINE represented so critical a threat that the Luftwaffe attack rivalled the action near AVRANCHES (T8718). Potent evasive tactics were employed. Planes made run s against the targets from several different directions, darting in and out of cloud cover, and engaging in mock dog fights before diving on the target. In one instance, which occurred at night, an enemy plane came over low, twice open to attract attention, followed by two or three others which, with motors cut, glided quietly in to bomb a tracer source. In the face of extremely heavy losses, sixty enemy planes destroyed or probably destroyed were claimed for the two day period, the assaults against the bridges and nearby targets continued. The effectiveness of Antiaircraft fire was further demonstrated when twenty five FW 190's attempted to strafe and bomb from 1000 feet. Of this number, Antiaircraft Artillery claimed to have shot down fifteen. Despite the aggressive enemy tactics, no damage resulted to the bridge or other important objectives in the area. For the second time in the campaign, a critical threat toward the heart of enemy communications and supplies was met by an all out effort on the part of the Luftwaffe, and for the second time the effort met with failure. Dispositions of XV Corps Antiaircraft Artillery which so successfully defended the crossings are shown in Figure 4.

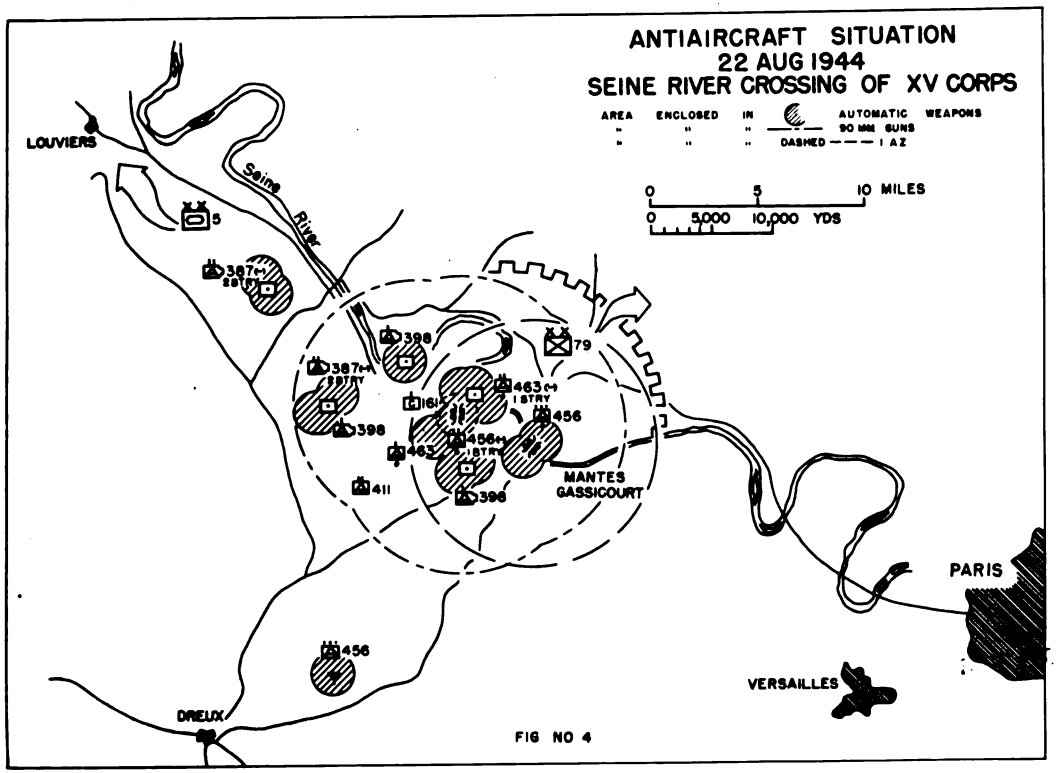

FIG NO 4

By this time important supply points had been established forward of LE MANS (VL979) and information was received that large quantities of supplies would be landed at an airfield in the vicinity of EVREUX (U5752). Defense of airfields south of AVRANCHES (T8718), now in the rear of the Army area was taken over by IX Air Defense Command Antiaircraft Artillery and Third US Army units so relieved moved forward to protect the new cargo field and supply installations in the vicinity of CHATEAUDUN (N8161) and MEHUN (N1944).

Responsibility for Antiaircraft Artillery defenses at ORLEANS (W6740) was taken over from XII Corps by Army on 22 August. The 119th Antiaircraft Artillery Gun Battalion was moved to vicinity of MONTARGIS (X2645) and released there for employment by the XII Corps.

Considerable importance was attached to the river crossings at MONTARGIS (X2645), MEHUN (X2705), MONTEREAU (X3193) and SENS (X6660) and the Antiaircraft defenses at these points were augmented and adjusted as necessary to provide adequate protection. All of these areas had been or were being established as Inner Artillery Zones. A Gun Battalion and two Automatic Weapons Battalions were attached to XII Corps for defense of the crossing at SENS (X6660). On 23 August the enemy struck at the crossing. Twelve to fifteen enemy planes flying low, in a determined effort to carry out their mission, were met by accurate flak which brought down three planes and drove the remainder off.

The attacks against bridge north of MANTES-GASSICOURT (R6161) were not resumed, apparently because of the prohibitive cost in aircraft destroyed. Here, in addition to warding off enemy air attacks, automatic weapons and gun battalions were given credit for repelling successive attacks on the bridgehead by ground troops.

On August 21, Antiaircraft Artillery defense of LE MANS (VL979) became the responsibility of Advance Section Communications Zone due to the movement forward of the rear army boundary. Antiaircraft Artillery so relieved was redisposed to protect critical points in the vicinity of ETAMPES (N8897), and ammunition and other supply points in the forward area. The Automatic Weapons defenses in the vicinity of CHATEAUDUN (N2161) were extended in order to furnish protection for a XIX Tactical Air Command Airfield southeast of the city.

Although enemy air activity now began to lessen, seven Category I's (destroyed) and eight Category II's (probably destroyed) were claimed for the twenty four hour period 21 August.

The XV Corps, 23d Antiaircraft Artillery Group, and attached units were relieved from assignment to Third US Army and assigned to First US Army on 21 August. The 413th Antiaircraft Artillery Gun Battalion attached to XV Corps was to be returned to Third US Army when relieved by a First US Army unit since all gun battalions in the Third US Army were normally under Army control and attached to corps only for specific missions. This movement of troops to First US Army also changed the Army boundary to exclude the river crossing at LA TUILERIE-GASSICOURT (R6161).

As the XII and XX Corps, southeast of occupied PARIS (3054.5), continued their swift thrust to the east, the defense of MONTARGIS (X2645) was taken over from XII Corps by the Army in accordance with the policy of pushing forward as soon as possible and relieving Corps Antiaircraft Artillery for forward areas. Army units, both 90mm and Automatic Weapons were moved forward from ETAMPES (N8897) to the vicinity of MONTEREAU (X3193) and the defense of that crossing was taken over by Army from XX Corps. The 217th Antiaircraft Artillery Gun Battalion which had been protecting ORLEANS (W6740) was moved forward and released to XII Corps for the use in the defense of TROYES (U2773) upon capture of that city.

Automatic Weapons defenses in the rear of the Army area were readjusted in order that units might be pushed forward to protect river crossings in the vicinity of MONTARGIS (X2645), SOUPPES (X2966) and NANGIS (X3057).

By 26 August the enemy activity had decreased considerably. Only four aircraft were reported over the entire Third US Army area.

Automatic Weapons protecting Class I, III and V supply points in the rear of the Army area were moved forward to defend similar installations operating in the vicinity of SENS (X6660).

Plans were made for the establishment of Inner Artillery Zones at EPERNAY (T3356), REIMS (T3377) and CHATEAU-THIERRY (S8957) and the Antiaircraft defense of these places. Plans included the protection of bridges, the airport at REIMS, (T3377) and air landing strips in the vicinity of EPERNAY (T3356) which might be used for the landing of cargo planes with gasoline and other critical supplies.

Digitized by Google

Antiaircraft Artillery units which had been attached to the First US Army for the assault had been allowed to store Directors and Power Plants. Although units had reported considerable success with the Stiff-bog-stick, instructions were now issued that all Third US Army units which had turned in this equipment were to take immediate steps to recover it in order that the effectiveness of their fire might be increased in situations when director controlled fire was possible.

Preliminary planning was started for the establishment of Antiaircraft Artillery defenses at the river crossings along the MARNE River at CHALONS - SUR - MARNE (T5446) and VITRY - LE - FRANCOIS (T6918). The rapid advance of Third US Army made it very difficult to push units forward fast enough to provide protection for vital river crossings, but in nearly every instance, Antiaircraft Artillery was ready to move in to defend the critical area immediately after the bridge or crossing was secured.

On 29 August the XV Corps reverted to the control of the Third US Army. All Antiaircraft Artillery Battalions attached to the corps, except for units attached to Divisions reverted to Third US Army along with the corps.

Enemy air activity had declined steadily since the heavy attacks at MANTES-GASSICOURT (R6161) but it was realized that the German Air Force was still capable of a strong effort and Antiaircraft Artillery continued to push forward to protect the newly gained critical points on the main routes of advance.

On 29 August, Inner Artillery Zones were established at FONTAINEBLEAU (X2992), MONTEREAU (Y8893) and TROYES (Y2773) and on the following day Inner Artillery Zones also came into effect at CHATEAU-THIERRY (S8957), VERNEUIL (T0465), EPERNAY (T3156), REIMS (T3377), CHALONS (T5446) and VITRY (T6918). As defense of these points and restricted areas were established, Inner Artillery Zones in the rear of the Army zone were cancelled.

On 31 August, the Army discontinued the defense of MONTARGIS (X2459) and moved units forward to relieve XII Corps of the responsibility for defense of SENS (X6866) and TROYES (Y2773).

During the month of August, there had been 1,088 enemy raids consisting of 2,352 aircraft over the Third US Army area. Of these planes, Antiaircraft claimed to have destroyed 216 and probably destroyed ninety three more, while suffering this loss of planes and personnel, the German Air Force failed in its efforts. No bridge or installation defended by Third US Army Antiaircraft Artillery had been damaged during the entire month and the lines of communication had never been cut. In addition to its success against the Luftwaffe, Antiaircraft Artillery had played an important role in the ground fighting. This was particularly true in the case of the self-propelled units with the armored divisions which, when not required for their primary mission, had employed their automatic weapons with great success against enemy ground units.

Weekly intelligence reports published by the Antiaircraft Section, Headquarters Third US Army during the month of August are attached as Annex I. Also attached as Annex II are selected extracts from the daily unit reports.

CHAPTER 4
SEPTEMBER OPERATIONS

OPERATIONS OF THE ANTIAIRCRAFT ARTILLERY SECTION - SEPTEMBER 1944

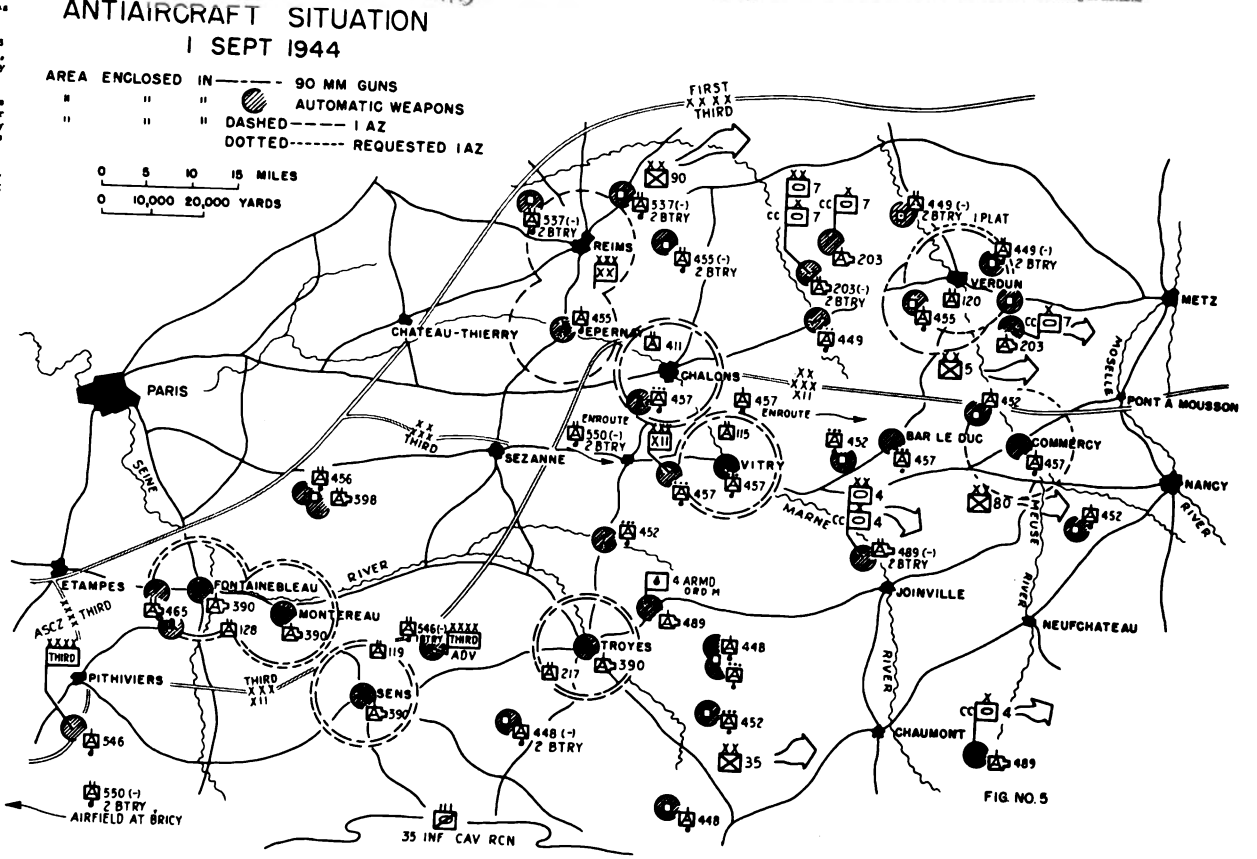
As of 1 September, Third US Army Antiaircraft units had established defenses at crossings of the SEINE, MARNE and MEUSE rivers, important road junctions and numerous supply installations throughout the Army area. The disposition of units is shown in Figure 5. Those Antiaircraft units attached to VIII Corps and operating on the BRITTANY Peninsula are not shown.

In order to furnish protection for important installations forward in the Army area, it became necessary to set up priorities for defense. Appropriate staff sections of the Headquarters were contacted and it was decided to give up gun defense of the SEINE river crossings at FONTAINEBLEAU (X2891) and MONTEREAU (X3195). The 128th Antiaircraft Artillery Gun Battalion was to move forward to SENS (Y6666) and TROYES (Y2973) to cover the river crossings at these two points.

The 119th Antiaircraft Artillery Gun Battalion which had been covering the river crossing at SENS (Y6666) was to be moved to the cities of REIMS (T3181) and EPERNAY (T2457), putting two batteries at each point.

The [illegible] Antiaircraft Artillery Gun Battalion which had been defending the river crossing at TROYES (Y2973) was to be released to the XII Corps [illegible] relieved by the 467th Antiaircraft Artillery Gun Battalion. This battalion was being [illegible] in accordance with the Army policy of making gun battalions [illegible] Corps in order to establish gun defenses at critical points as [illegible] such points were cleared of the enemy by the ground troops.

Automatic Weapons defenses in the Army area were also readjusted. With the movement forward of the Army rear boundary, defense of the airfield at CHATEAUDUN (R2461) became the responsibility of the Communications Zone, and two batteries of the 550th Antiaircraft Artillery Automatic Weapons Battalion relieved from this mission became available to augment the defenses already established at VITRY-LE-FRANCOIS (T6919). Class I and III Supply Point Number 28 and Class V Supply Point Number 19 were no longer of great importance and the 467th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was moved forward to augment the defenses at EPERNAY (T2457), REIMS (T3181) and the river crossing at CHALONS (T5446).



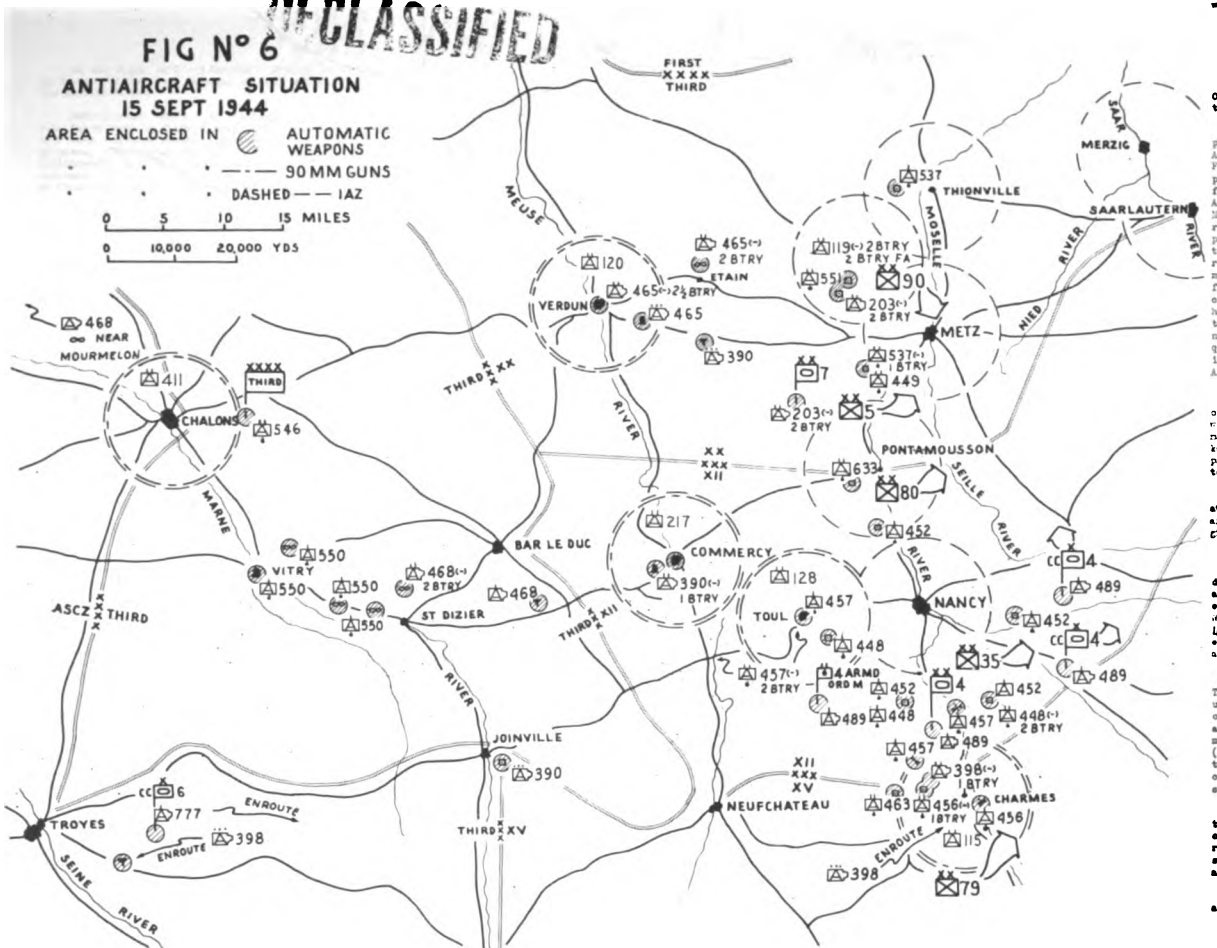


FIG. NO. 5

Digitized by Google

[illegible] were assigned as Corps Artillery [illegible] September and [illegible] Third US Army [illegible] Corps [illegible] Third [illegible] Army [illegible] Corps [illegible] Army [illegible] Corps [illegible] Army [illegible] Corps

DECLASSIFIED

On the 29th of September the XV Corps was relieved from assignment to Third US Army. The following attached Antiaircraft Artillery units were temporarily attached to Sixth US Army Group along with XV Corps:

25d AAA Group

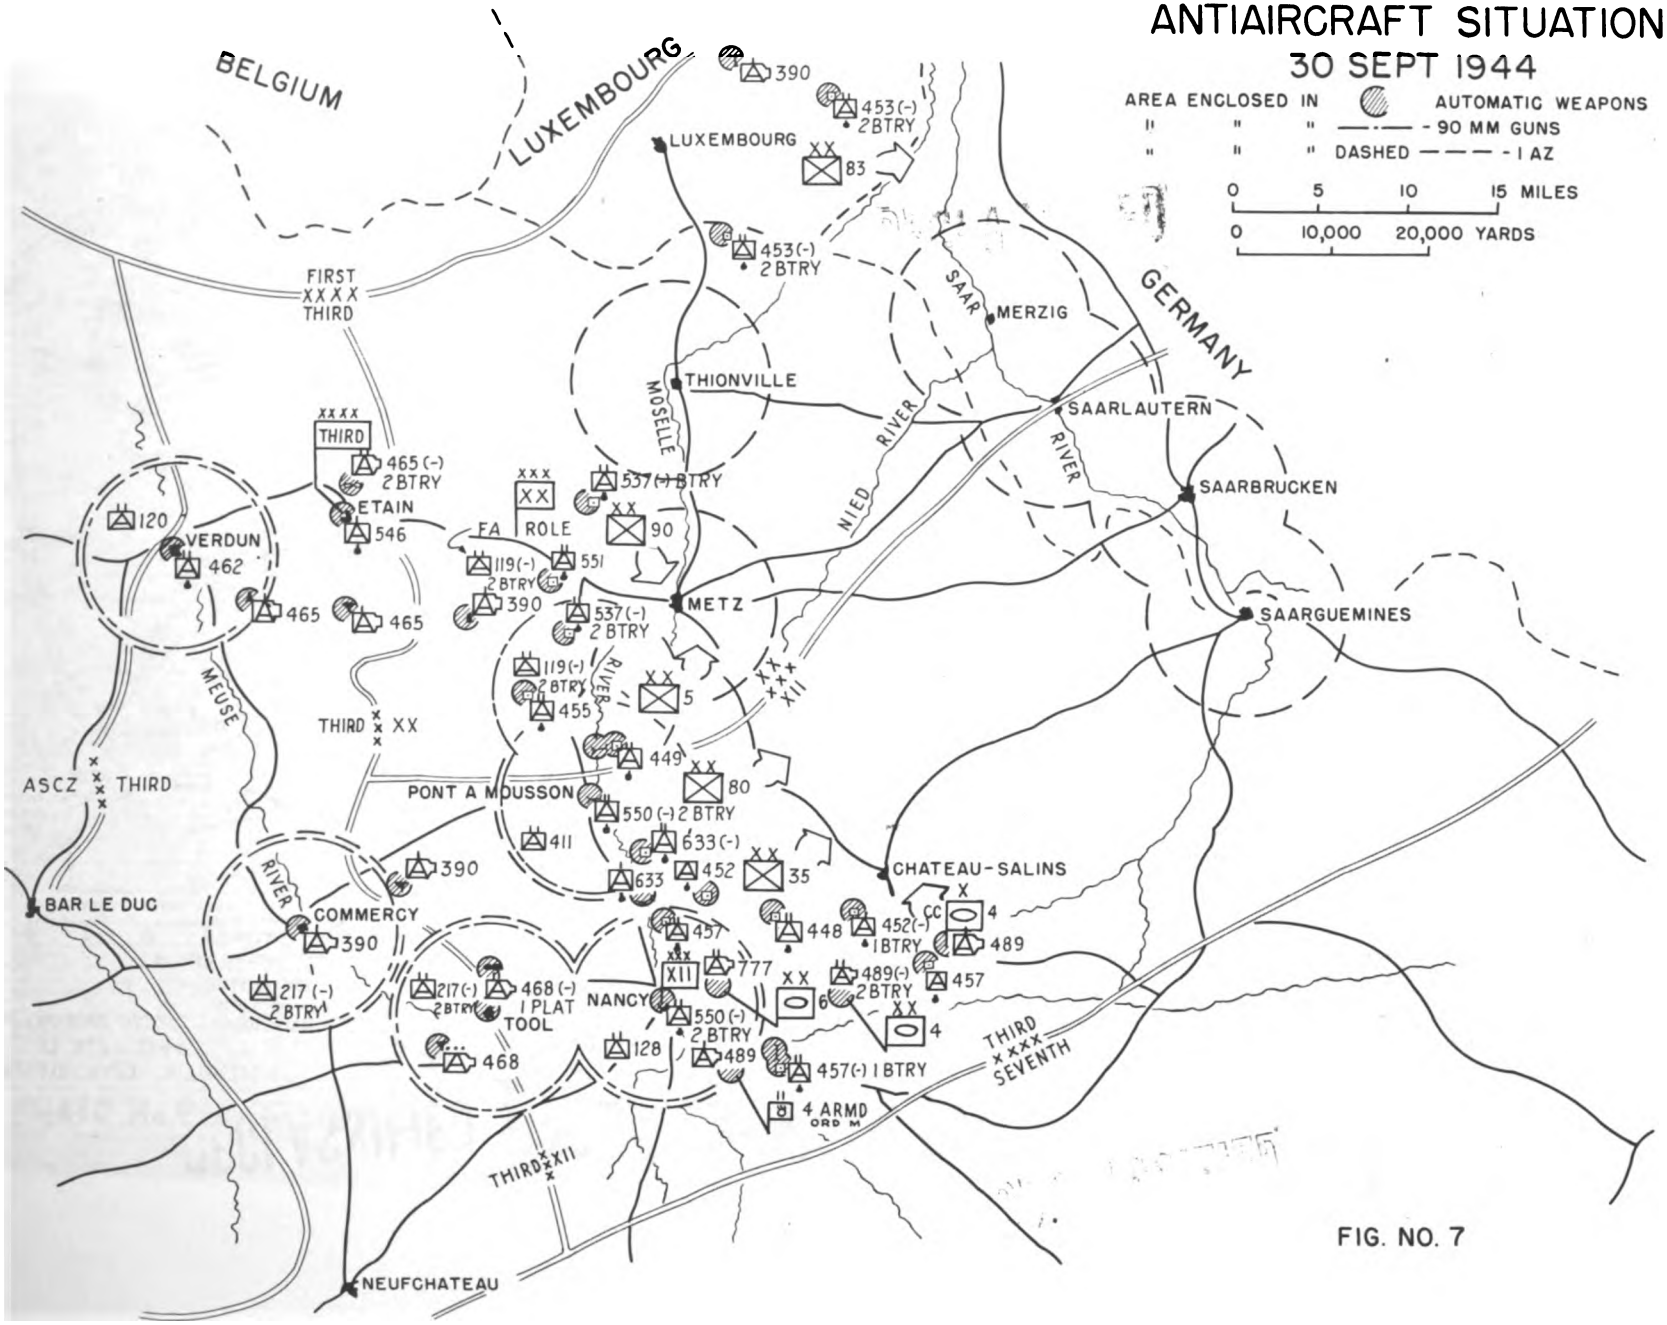
1456th AAA AW Bn	1634 AAA AW Bn (79th Inf Div)
398th AAA AW Bn	224 Fr (24 Pr Armd)
115th AAA Gun Bn	559th AAA AW Bn

Of these units, some were expected to revert to Third US Army control in the near future.

The repair and maintenance of equipment and the procurement of spare parts for radar had become critical by the latter part of September. All Antiaircraft Artillery Gun Battalions came to Third US Army from First US Army with spare parts kits ME-101 as their only source of Radar parts. No spare parts were available in Army Signal Depots. The effects of this situation were not felt during the first days of the Army's advance, but with radars on the air twenty four hours daily, the ME-101 spare parts kits became dangerously depleted and maintenance of radars presented a serious problem. The arrival of a few spare parts, plus two additional SCR-584's requisitioned in August, were sufficient to keep radars actually used for gun laying, in operation. The extra radars were heavily cannibalized for parts although no parts were removed except as a last resort. A log was kept of everything removed to facilitate any eventual refitting of the sets. Cannibalization of course, was not a solution to the spare parts problem since once a part had been removed there was no further replacement possible for that particular part. Radar officers were dispatched to PARIS (SO439) where a new radar spare parts depot had been set up. Although only a small quantity of spare parts were obtained, there issue was closely controlled in accordance with the most critical needs. By these means all Third US Army Radars were maintained in operation during the month of September.

Since the activity during the first week in September, no attacks of consequence were reported. Sporadic, half-hearted attempts to strafe were made by one or two enemy aircraft from time to time, but for the most part raids were confined to reconnaissance flights. Low clouds kept these at low altitudes and, accordingly, daylight reconnaissance proved costly as this reduction in range enabled automatic weapons units to engage at good range and promptly bring them down.

Most enemy aircraft appeared at low or medium altitudes, with some at night and some during daylight. Evasive action followed immediately after any engagement by Antiaircraft. Occasionally a plane turned to give battle, but this was rare.



In actions of note, the 120th Antiaircraft Artillery Gun Battalion, during the first week, engaged eight enemy aircraft attacking a bridge at CHALONS (89376) during the hours of darkness, and downed five of the eight. For the same period, the 489th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled), protecting Combat Command "A" of the 4th Armored Division, claimed six Category I's (destroyed) of fifteen enemy aircraft which came in low to strafe and fire rockets. Other actions of interest by Antiaircraft Artillery are included in Annex 4.

An analysis shows how sharply enemy air activity was curtailed in Third US Army zone during the month of September. As compared with August's totals of 1117 raids by 3213 aircraft, September's figures showed only 128 raids by 287 aircraft during the entire month. This was an average of approximately nine planes per day as compared with approximately 103 planes per day during August. Twenty eight Category I's (destroyed) and fifteen Category II's (probably destroyed) were the total claims submitted by Antiaircraft Artillery units during the month of September. Enemy air activity for the month of September is further summarized in Weekly Intelligence Reports, Annex Number 3.

Losses sustained by the German Air Force, both to Antiaircraft Artillery and the Air Forces may have partially caused this down-scaling of effort. Bad flying weather was also a factor. Probably the main reason was the desire of the German Air Force to husband and recoup its strength, risking no large losses until an all-out effort was strategically necessary and tactically sound.

Dispositions of antiaircraft artillery as of the end of September are shown in Figure 7.

CHAPTER 5

OCTOBER OPERATIONS

CLASSIFIED

On the night of 2 - 3 October, HUMBERT (U7748) was established as an Inner Artillery Zones in order to cover the XX Corps crossings over the MOSELLE River.

Antiaircraft defense of the 290,000 watt radio station LUXEMBOURG was taken over by Ninth US Army from Third US Army. This installation had been captured intact and because of its importance for propaganda purposes, its defense had a high priority. The battery of the 390th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) so relieved, was moved on 2 October to TOUL (U6410) to augment the defense of Class III Supply installations there.

The 448d Antiaircraft Artillery Automatic Weapons Battalion which had been attached temporarily to Third US Army reverted to Ninth US Army control on 2 October. Defenses in the Army area were readjusted but the available Antiaircraft Artillery still proved inadequate to protect vital areas. In order to provide defense for VERDUN (U2965) it became necessary to detach from XIII Corps the two automatic weapons batteries which had been temporarily attached, from Army, for defense of the PONT-A-MOUSSON (U7735) crossing. XIII Corps continued defense of the crossing with other Corps Antiaircraft troops.

In preparation for the movement of Third US Army Headquarters from ETAIN (U4770) to NANCY (U8511), two batteries of the 526th Antiaircraft Artillery Automatic Weapons Battalion were relieved from the defense of the headquarters at ETAIN (U4770) and moved to NANCY (U8511), on 3 October. Two batteries of the 550th Antiaircraft Artillery Automatic Weapons Battalion, so relieved at NANCY (U8511), were moved to VERDUN (U2965) to augment the Antiaircraft Artillery defense of bridges, railheads, supply points and Twelfth US Army Group Headquarters which was located in that city. Responsibility for the defense of NANCY (U8511) passed from XII Corps to 30th Antiairaraft Artillery Brigade on 3 October.

Inner Artillery Zones had been established at MERZIG (Q8995), SAARLAUTERN (Q8980), SAARBRUCKEN (Q4571) and SARREGUEMINES (Q5157) in anticipation of crossings at these points. Since it did not appear probable that these restricted areas would be utilized in the immediate future, and in order not to hamper the activities of friendly aircraft over these areas, Inner Artillery Zones at these places were cancelled on 5 October.

To improve the combat effectiveness of Antiaircraft Artillery Gun Battalions, Twelfth US Army Group attached a Gunnery Instruction Team to Third US Army on 4 October. The team was comprised of four officers who had had special training in 90mm gun and fire control materiel. Many of the gun batteries had received new materiel since their arrival overseas, and in some instances, additional instruction and training for operating personnel were necessary. It was planned to have these officers visit each Third US Army Gun Battalion for a period of several days, checking adjustments, assisting with maintenance, and indoctrinating personnel in new methods.

At PONT-A-MOUSSON (U7735), the 411th Antiaircraft Artillery Gun Battalion although primarily providing Antiaircraft defense for the bridges, had a secondary mission of supporting 80th Infantry Division Artillery. On 7 October, Division air observers had spotted a battery of 88mm Antiaircraft Guns firing against American aircraft. Counter-battery fire was opened by a battery of the 411th Antiaircraft Artillery Gun Battalion. After two direct hits were secured, the air observer radioed that the mission had been accomplished. Fire was conducted at a range of 12,950 yards.

Antiaircraft units with divisions also utilized their weapons in a ground role. During the advance of the 6th Armored Division from LEYR (U9883) to JARNISLICOURT (U9128) on 8 October, the 777th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled), provided close support to the Armored Infantry. Quadruple mount Caliber .50's were utilized to good advantage in cleaning out pockets of enemy resistance during the advance. In addition to causing many enemy casualties the battalion assisted in rounding up approximately 300 prisoners.

Two batteries of the 633d Antiaircraft Artillery Automatic Weapons Battalion were used by the 80th Infantry Division, supporting the attack of the 6th Armored Division, in the assault on high ground at MT TOULON (U8628) and MT ST JEAN (U8628). Sixteen Quadruple Mounts, Caliber .50's were employed to spray the woods where enemy troops were dug in. This is the first reported instance in which barrage fire by Antiaircraft machine guns had been employed in Third US Army preceding an infantry attack. 79,700 rounds of caliber .50 ammunition were expended. Results were reported by the division G-2 and G-3 to have been excellent in that this heavy machine gun fire contributed materially to the capture of 575 prisoners including ten officers.

When the XV Corps had been assigned on 29 September to Sixth US Army Group and Seventh US Army, all attached antiaircraft units remained temporarily with the Corps. The first of these to be returned to Third US Army was the 559th Antiaircraft Artillery Automatic Weapons Battalion on 9 October. One battery each of the battalion was deployed around airfields A-95, A-96, A-98 (all in the NANCY (U8511) - TOUL (U6410) area) and the bridge at PONT-A-MOUSSON (U7735).

Since there was no prospect that Inner Artillery Zones which had been established at METZ (U8659) and THIONVILLE (U8685) would be utilized in the immediate future, these were cancelled as of 11 October.

On 11 October the 453d Antiaircraft Artillery Automatic Weapons Battalion was relieved from assignment to Third US Army, and assigned Ninth US Army with the 83d Infantry Division.

Of twenty nine enemy aircraft reported over the Third US Army area in sixteen raids during the night 10 - 11 October, two were claimed as destroyed and three probably destroyed by Third US Army Antiaircraft.

Another Battalion, the 456th Antiaircraft Artillery Automatic Weapons, which had been temporarily attached with XV Corps to Sixth US Army Group and Seventh US Army, reverted to Third US Army on 10 October. This unit took over defenses covered by the 390th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled), which was then attached to the 26th Infantry Division.

In a continuation of the effort of the previous night, thirty-three enemy aircraft were reported over the Army area, during the night 11-12 October. Two planes were claimed destroyed and four were claimed probably destroyed by Third US Army Antiaircraft.

Since Class III Supply Point at FRESNES (U4760) had diminished in importance, B Battery of the 465th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was moved from that installation on 13 October, to the defense of the Air Force Class III Railhead at LERONVILLE (U4083). Similarly Army Class V Supply Point No 25 east of VERDUN (U2965) was depleted, and Battery A of the 550th Antiaircraft Artillery Automatic Weapons Battalion was moved from that installation to the Railhead at ST MIHIEL (U3935) where Air Force ammunition and gasoline were being unloaded. Other defenses were also readjusted in order to provide protection for an Air Force Class III Railhead at BANNONCOURT (U3642) and a Class III Supply Point west of ST MIHIEL (U3935) which contained more than 600,000 gallons of high octane gasoline. On 14 October, one battery of the 456th Antiaircraft Artillery Automatic Weapons Battalion moved from the TOUL (U6410) defense to LERONVILLE (U4083). The Battery of the 465th so relieved, covered the Air Force Class III Supply Point, east of ST MIHIEL (U3935), and the Air Force Class III and V Railhead at BANNONCOURT (U3642).

Maintenance difficulties on Antiaircraft Gun Battalion equipment were now increasing. Long hours of search had caused considerable wear to M-7 Generators supplying power for the SCR-584. Replacement of rings and spark plugs had become necessary in almost all units. It had also been found that voltage regulators were needed for these generators. Because of excessive wear, power surges became more frequent, causing radars to lose targets or go completely off the air. Working in connection with the Ordnance Section Third US Army, every effort was made to secure the necessary spare parts, as well as new generators.

In the XII Corps Zone, during the afternoon of 15 October, two Me 109's were observed to peal off from a dog fight involving some twenty aircraft. The enemy aircraft, hedgehopping at 300 mph, strafed Antiaircraft and Field Artillery positions along the front of the 26th Infantry Division. A number of antiaircraft batteries engaged these planes and both were shot down.

The 115th Antiaircraft Artillery Gun Battalion which had also been temporarily attached with XV Corps to Sixth US Army Group and Seventh US Army, was released to Third US Army on 15 October. Two batteries of the battalion were moved to NANCY (U8511) to reinforce the Antiaircraft defenses there, and the other two batteries were directed to COMMERCY (U6828) to relieve the 217th Antiaircraft Artillery Gun Battalion. The two batteries so relieved were moved to augment the two batteries of the 217th already at TOUL (U6410), which was becoming a supply point of first importance. Defenses of TOUL (U6410) and installations in its vicinity, now consisted of one gun battalion and five Automatic Weapons Batteries.

Upon request of the Passive Air Defense Officer, Third US Army, an arrangement was made whereby the 7th Antiaircraft Artillery Group, located in NANCY (U8511), would transmit air raid warnings to the civilian authorities.

In the XX Corps zone, two batteries of the 119th Antiaircraft Artillery Gun Battalion had been relieved of their primary mission by Corps in order to support Corps Artillery. The following account of terrain "Busting" near METZ (U8659) on 18 October, was one of many successful missions fired by these batteries. Where an initial volley was fired, two direct hits were scored on the locomotive of a supply train operating behind the enemy lines. Air bursts were laid on the area as the crew fled to cover. Two direct hits were also scored on the roadbed. Similar reports received during the month indicated the high degree of accuracy which characterized the fire of 90mm guns against ground targets.

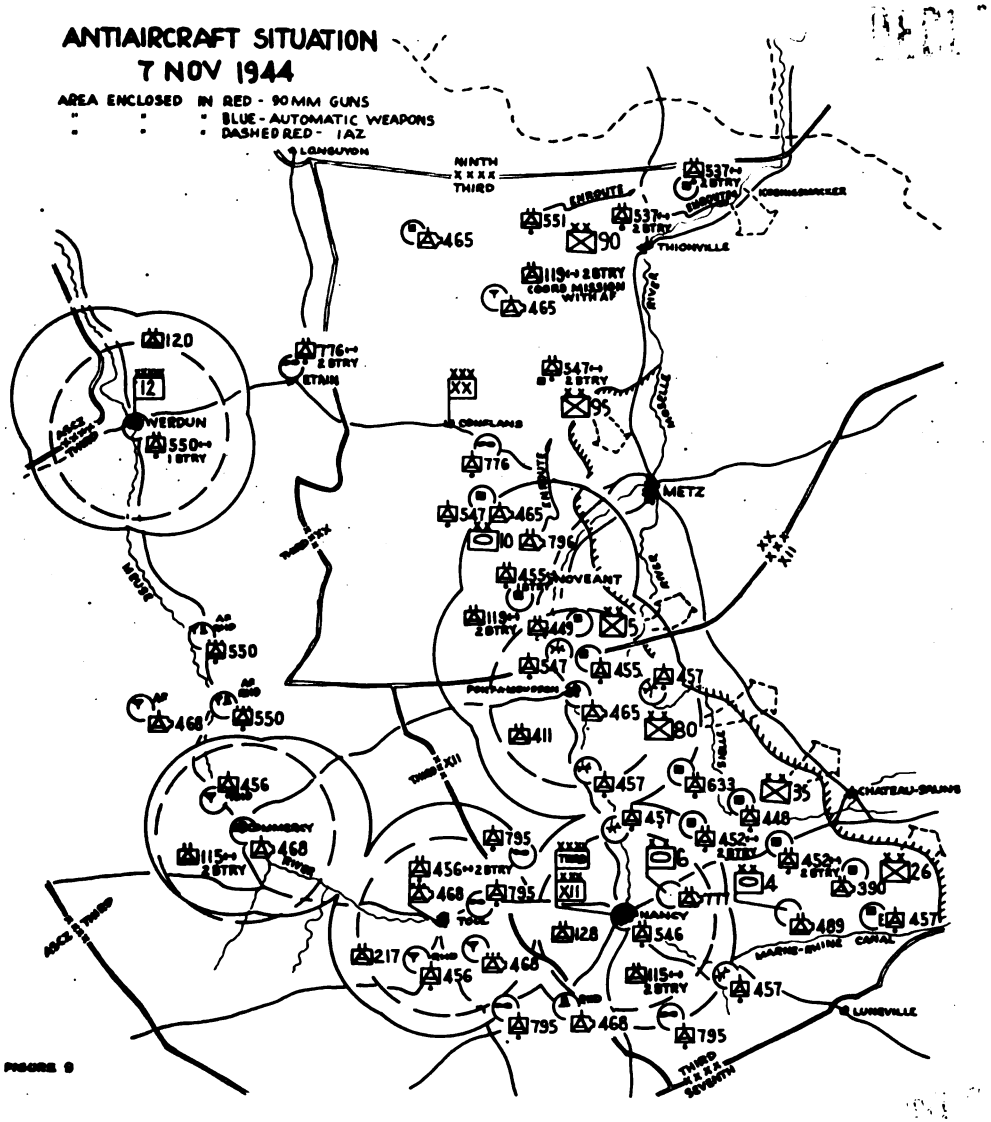
Notification was received that the 559th Antiaircraft Artillery Automatic Weapons Battalion which had been temporarily attached Third US Army was to revert to Ninth US Army on 21 October. One Battery of the battalion was defending the bridge at PONT-A-MOUSSON (U7735) while the remainder was employed on airfields in the Army area. Insufficient antiaircraft artillery was available to Third US Army to provide defense for vital installations in the Army area and continue defense of these fields. This situation was discussed with Twelfth US Army Group, and arrangements were made for IX Air Defense Command to attach six (6) Automatic Weapons Batteries to Third US Army (for operational control only) for the defense of airfields in the Third US Army area. Each airfield was to be defended by one Automatic Weapons Battery.

The night of 19 October furnished considerable activity for Antiaircraft defenses throughout the Army area. With no previous warning, about 450 RAF planes flew over the Army zone and through Inner Artillery Zones from about 2230 until 0230. In some cases IFF was shown but many planes flew through Inner Artillery Zones without showing IFF. To add to the problem, unidentified planes were entering the Inner Artillery Zones from the east. A large quantity of window was dropped in the NANCY (U8511) area and one Gun Battery was strafed by enemy aircraft. Two enemy aircraft were claimed destroyed and two probably destroyed by Third US Army Antiaircraft. No evidence of damage to friendly planes as a result of these engagements by Antiaircraft Artillery was received.

Flying bombs began to appear over the Army zone with some regularity. Two main routes seemed to be evident. One approached METZ (U8659) from the Northeast and turned South after crossing the MOSELLE River. The second was from the direction of the LUXEMBOURG (U8414) area flying South by Southwest. If these missiles were directed at any particular target, this was not apparent from a study of areas of impact. Reports indicated that the missiles were launched both from aircraft and from ground ramps. No damage was reported in the Army area.

On 23 October the 796th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was attached to XX Corps for the 80th Armored Division. The 778th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) and the 324 Antiaircraft Artillery Group were assigned Third US Army and were earmarked for attachment to III Corps.

Two batteries from the IX Air Defense Command arrived in the Army area and took over protection of Airfield A-82. The battery of the 465th so relieved was moved to Airfield A-54 increasing that defense to two batteries.



Another battery from the IX Air Defense Command arrived on 25 October and was moved into position on Airfield A-50. The battery of the 465th Antiaircraft Artillery Automatic Weapons Battalion so relieved moved to augment the defense of the Class III Supply Point near ST MIHIEL (U3935). The platoon of the 465th Antiaircraft Artillery Automatic Weapons Battalion which had been on this Class III installation was moved to the Air Force Supply Point at BANNONCOURT (U3642) increasing that defense from a platoon to a battery.

Two more Automatic Weapons Batteries from the IX Air Defense Command arrived on 26 October and established defenses for airfields A-95 and A-98 with one battery each.

During the night 26 - 27 October, three aircraft were reported over the Army area and two were claimed destroyed.

The 139th Antiaircraft Artillery Gun Battalion fired another series of successful field artillery missions on 28 October in support of XX Corps Artillery. First an enemy troop concentration near the VERDUN Forts was engaged and dispersed with heavy casualties. Fire was then conducted on an enemy motor convoy, and debris was scattered in all directions. Following this an enemy supply train was engaged, the locomotive was destroyed and several buildings in the vicinity were set on fire.

Digitized by Google

On 29 October, the sixth IX Air Defense Command Automatic Weapons Battery arrived and moved into position at airfield A-95. This phenomenal arrival was occasioned by shortage of transportation, since these were all semi-mobile units.

Arrangements were made to have daily scheduled tracking missions flown by the 10th Liaison Squadron for all Army Gun Battalions. These missions were necessary as a means of checking the calibration of the radar orienting scope as well as an overall check of the orientation and synchronization of the equipment. In addition, tracking missions were being provided for Army automatic weapons battalions as frequently as possible.

Enemy air activity had been limited during October in keeping with the lack of activity by ground troops on Third US Army front. Only when a serious threat to vital areas developed, had any large scale effort been undertaken by the German Air Force. Enemy planes made regular reconnaissance flights over the Army area, however. Claims for the month totaled 27 planes destroyed or probably destroyed by Third US Army Antiaircraft Artillery to bring the total since August 1st to 1464.

There is enclosed as Annex 5, Weekly Intelligence Reports for the month of October, except the first five days, which are covered in Report No 10 of Annex 1.

CHAPTER 6
NOVEMBER OPERATIONS

To assist the XX Corps in protecting projected crossings over the MOSELLE River, two batteries of the 469th Antiaircraft Artillery Battalion (Self-propelled) were detached from the 38th Antiaircraft Artillery Brigade and attached to the Corps on 1 November.

In preparation for the attack across the MOSELLE river by the XX Corps, an Inner Artillery Zone was established on 3 November at HOHENGRAEFEN (V9490) where the main effort was to be made. Arrangements were also made for this Inner Artillery Zone to be cancelled and a new one set up at THIONVILLE (U8685) as soon as a bridgehead had been established and the main route through that city could be used for movement of troops and supplies.

Supply installations throughout the army area had been greatly increased in size in preparation for the scheduled offensive. Antiaircraft defense of these installations assumed a high priority even though air activity had continued to be light. During the 5th and 6th of November, only six enemy planes were over the Third US Army area, three of which were shot down.

The disposition of Antiaircraft units prior to the attack is shown in figure 8.

The attack was to be preceded by large scale bombing of enemy positions, as a supplement to artillery preparation prior to the ground offensive. Since this bombing was to be carried out by heavies at high altitudes, it was considered necessary by the Air Force that pilots be provided with a positive visual means of orientation to prevent the dropping of bombs on friendly troops. At the request of 8th Air Force, the Antiaircraft Section, Third US Army made plans to provide this orientation by means of flak lines in the sky.

The attack took place on 9 November, and between 0900 and 1000 the heavy bombers arrived over the Third US Army area.

Two separate flak lines were fired. In the vicinity of THIONVILLE (U8685) two batteries of the 119th Antiaircraft Artillery Gun Battalion established one line. In the vicinity of METZ (U8669), one battery of the 441th Antiaircraft Artillery Gun Battalion and one battery of the 120th Antiaircraft Artillery Gun Battalion established another line. Each line consisted of eight bursts spaced at 500 yard intervals, forming a line extending approximately one mile north and one mile south of a fixed point, the location and altitude of which had been predesignated by the Air Force. The bursts were fired in close succession, starting on the north and progressing south. The METZ (U8669) flak line was repeated three times per minute and the THIONVILLE (U8685) line two times per minute throughout the bombing period which lasted approximately one hour. Ordinary 90mm ammunition without added color was utilized.

Both flak lines were fired at 17000 feet altitude which was approximately 3000 feet below the altitude of the bomber formations. The line at THIONVILLE (U8685) proved ineffective due to interfering cloud forma-

Digitized by Google

tions, but the bursts in the METZ (U8659) area were clearly visible both in the air and from the ground.

Reports from the Air Force were that the marker line at METZ (U8659) had proved to be a valuable aid to the pilots and bombardiers. In addition it was reported that the action had a favorable morale effect on the doughboys who could see that their positions in relation to the enemy targets were clearly designated by the line of bursts. No bombs were dropped on friendly troops.

The ground attack, pushing off after the preparation, produced a short lived reaction from the German Air Force. Thirty-three enemy planes appeared over the Third US Army area during the day, evidently to see what was going on for no persistent attacks were made. One of the raiding planes was destroyed and three probably destroyed.

On the 11th of November a check was made of all supply installations and bridges in the army area. Due to heavy rains the MOSELLE river and its tributaries had risen to a flood state, inundating much of the country side and washing away many of the bridges. This caused many previously unimportant streams in the Corps zone to become sizable rivers, the crossing of which required Antiaircraft Artillery protection. In addition to this, large quantities of supplies were building up in the army area for the new advance. Many of these supply installations were being moved forward across the river in the event the remaining bridges were destroyed by the floods. These points coupled with the large number of installations becoming operational required much of the Army Antiaircraft Artillery to be moved well forward in the Corps zones.

In accordance with instructions from Twelfth US Army Group, arrangements were made whereby Antiaircraft Artillery in Inner Artillery Zones could be directed to hold fire to allow the safe passage of friendly bomber flights through the restricted areas. The arrangements were based on the assumption that adequate notice of such flights would be provided the Army Antiaircraft Operations Room.

Since Antiaircraft Artillery communications were inadequate to insure transmission and acknowledgment of "Hold Fire" missions, radio equipment over and above that authorized by TO's was borrowed from the XIX Tactical Air Command and Third US Army Signal Supply. Each Antiaircraft Gun Battalion was furnished a FM radio set which would place it in direct communications with the Army Antiaircraft Operations Room. In addition, each battalion was provided with an SCR-193 which insured communication with the Army Antiaircraft Operations Room by CW in case of failure of the FM set. Both sets were to monitor the Army Antiaircraft Operations Room frequency over which hold fire orders would be transmitted and each order was to be acknowledged.

By 15 November, the crossing at THIONVILLE (U8685) had become important for movement of both troops and supplies and an Inner Artillery Zone was established there. Although previously it had been planned to cancel the Inner Artillery Zone at KOENIGSMACKER (U9490) at the time the THIONVILLE (U8685) Inner Artillery Zone was established, the KOENIGSMACKER (U9490) restricted area was retained temporarily at the request of XX Corps.

As the attack progressed it appeared that the city of MERZIG (U8095) would be the site of a river crossing by troops of the XX Corps. An Inner Artillery Zone was established there effective 18 November. On this same date enemy air activity flared up considerably. Nineteen attacks were made on targets in the Third US Army area by thirty one enemy aircraft. Antiaircraft shot down seven and made further claims for having probably destroyed eight additional aircraft.

Looking ahead towards the necessity for protecting bridges across the RHINE river, Twelfth US Army Group was requested to obtain two Searchlight Control detachments and one Searchlight Battery for Third US Army. It was planned to use these units for detection of explosive laden barges or anything else which the enemy might attempt to float against the bridges which would be established over the RHINE river.

On 20 November, two batteries of the 120th Antiaircraft Artillery Gun Battalion were moved from VERDUN (U2966) to THIONVILLE (U8685). Temporarily, they were placed under the operational control of XX Corps which was still responsible for Antiaircraft Artillery defense of the MOSELLE river crossing. Arrangements made, were, that when it became necessary, XX Corps would move its own gun battalion, the 119th Antiaircraft Artillery Gun Battalion, from THIONVILLE (U8685) to cover any new crossings over the SAAR river to the east. At that time, responsibility for the MOSELLE river crossing at THIONVILLE (U8685) would be assumed by the 36th Antiaircraft Artillery Brigade which would have available the two batteries of the 120th Antiaircraft Artillery Gun Battalion, plus two Automatic Weapons Batteries which had been temporarily attached to Corps to cover the crossings in THIONVILLE (U8685) and vicinity.

On 22 November the XX Corps requested an Inner Artillery Zone for SAARBURG (L1513) to become effective the night of 24 November, as the corps plan now indicated that the main crossing was to be affected at this point rather than at MERZIG (U8095). The XX Corps further agreed to cancel the Inner Artillery Zone at KOENIGSMACKER (U9490) at the same time that SAARBURG (L1513) came into effect.

On 15 November, a report from the 465th Antiaircraft Artillery Automatic Weapons Battalion emphasized the importance of complete information in the reports submitted daily by units. At a Class III Supply Point defended by one battery, security measures were difficult, the location of the installation being such that opportunities for sabotage were plentiful. This information was given to the Army Quartermaster and resulted in the immediate movement of the installation to a location where security measures could be improved.

To provide a mobile reserve for the attack, trains of ammunition were being brought into the army area and left on sidings so that they could be moved forward as necessary. In order to protect such vulnerable targets, antiaircraft defenses in these areas were readjusted so that the protection of these sidings could be augmented on short notice in accordance with the build-up of trains.

The shortage of Antiaircraft units under Third US Army control had now become critical. Many vital installations in the Army area were without Antiaircraft Artillery protection. Arrangements were therefore made with IX Air Defense Command, through Twelfth US Army Group, for IX Air Defense Command to take over Antiaircraft defense of several installations along the rear of the Army boundary. These installations, VERDUN (U2966), and Class III Supply Points near ST MIHIEL (U5985), LEROUVILLE (U4283), and COMMERCY (U4220) would be actually in the Communications Zone at the next change in the Army rear boundary which was scheduled for 30 November. Automatic Weapons defenses were to be taken over by IX Air Defense Command at once. Third US Army was also to be relieved of gun defense at VERDUN (U2966) and COMMERCY (U4220) as soon as a gun battalion could be made available and moved forward by IX Air Defense Command.

XII Corps was defending an important Class 70 bridge at SAILONNES (Q0821), railhead at CHAMBREY (Q0521) and railhead in the vicinity of MONCEL SUR SEILLE (Q0800). Movement forward of the corps rear boundary on 21 November placed these installations in the Army area. Arrangements were made for corps to continue to cover these points until 23 November by which time Army was to take over the defenses of the bridge at SAILONNES (Q0821) and the railhead in the vicinity of MONCEL SUR SEILLE (Q0800). CHAMBREY (Q0521) was no longer considered important, as the railhead at this point had moved to CHATEAU SALINS (Q1085). The Army Antiaircraft to cover these installations was to come from the bridges at FROUARD (U0219), CUSTINES (U0522) and DIEULOUARD (U7829) and the Class III installations at ATTON (U7954), all of which were now relatively unimportant due to the receding of the flood waters of the MOSELLE river and the large number of bridges which could now be used to cross the river.

Six single enemy planes made raids over Third US Army area on 25 November, two of which were shot down by Antiaircraft fire. On the 27th, the same number of enemy aircraft made raids over the army area, with one going down as a result of Antiaircraft fire.

With capture of SAARLAUTERN (✠880), imminent, the Antiaircraft Officer, XX Corps, requested that an Inner Artillery Zone be approved immediately for this city. This restricted area was established on 30 November. The Inner Artillery Zone at SAARBURG (L1513) was cancelled.

The month of November saw a further decrease in hostile air activity over the Third US Army zone. Totals for the month reported by Antiaircraft units were seventy eight raids by 136 aircraft.

Of these 136 aircraft, sixteen made attacks upon ground targets, in formations of one to three aircraft. A total of ten attacks were made, of which all but one were strafing attacks, made from altitudes of 100 - 3,000 feet. The exception was an effort by two Me 109's which dropped anti-personnel bombs or mines over the area occupied by an armored divisions artillery from an altitude of 3,000 feet. All attacks but one were made by daylight, the night attack being a strafing run by an He 111 over Antiaircraft positions in NANCY (U8611). Except for this He 111 and one Me 410, all attacking planes were Me 109's.

Field Artillery was the target most frequently attacked, with other targets being armored columns and installations, troops, standing vehicles, Antiaircraft positions and one Cub observation plane. Effects were negligible, particularly in view of enemy aircraft lost to Antiaircraft fire. On a strafing attack, one man of a Field Artillery unit was killed and three were wounded. On the bombing attack, troops of an armored combat Command are known to have been injured but the number of casualties was unknown, though believed to have been slight. No other casualties were reported and, likewise, no material damage was reported.

Of the sixteen enemy aircraft attacking ground targets, Antiaircraft units claimed five destroyed, two probably destroyed and one damaged. Overall totals for the month were sixteen Category I's (destroyed) and eleven Category II's (probably destroyed) of the 136 enemy aircraft reported in the area.

At the close of November the Antiaircraft situation in the Third US Army was as indicated in Figure 9. Copies of the Weekly Intelligence Reports covering the month of November, except for the first three days, which are covered in Annex 5 of the previous month, are inclosed as Annex 4.

CHAPTER 7
DECEMBER OPERATIONS

The 52d Antiaircraft Artillery Group which was assigned to Third US Army on 22 November, arrived in the vicinity of JUTREVILLE (U5676) on 2 December and was attached to the III Corps. Plans were made to attach additional Antiaircraft units to the corps on the normal scale, pending availability of units.

By 3 December, the advance of the Third US Army on SAARLAUTERN (✠981) indicated that this city would fall within a few days. Two batteries of the 119th Antiaircraft Artillery Gun Battalion were moved therefore from THIONVILLE (U8685) to the vicinity of SAARLAUTERN (✠981) to protect the vital bridge across the SAAR River which had been seized intact. The other two batteries remained at THIONVILLE (U8685).

The advance on SAARGEMUEND (✠597) was likewise progressing satisfactorily and the 115th Antiaircraft Artillery Gun Battalion was moved forward to the vicinity of HUTTENLANGE (✠151) pending the clearance of SAARGEMUEND (✠597) which would be the focal point of communications on the south flank of the Army. Arrangements were made to establish this city as an Inner Artillery Zone effective 7 December.

On 6 December, IX Air Defense Command took over complete responsibility for Antiaircraft defense of VERDUN (U5978) and consequently the two batteries of the 120th Antiaircraft Artillery Gun Battalion were moved forward to PONT-A-MOUSSON (U7735). Two batteries of the 111th Antiaircraft Artillery Gun Battalion were relieved at that crossing and moved North to reinforce the Antiaircraft gun defenses at METZ (U8858).

To the North, the two batteries of the 119th Antiaircraft Artillery Gun Battalion, still at THIONVILLE (U8685), were moved forward for the defense of SAARLAUTERN (✠981) and the 38th Antiaircraft Artillery Brigade took over from XX Corps responsibility for defense of the crossing at THIONVILLE (U8685) and vicinity.

By this time it had become apparent that all SAAR River crossings in the XX Corps zone would be south of MERZIG (Q8195). The Inner Artillery Zone which had previously been requested, for that city was therefore cancelled on 10 December.

On 9 December, the 87th Infantry Division recently assigned Third US Army, began to move from METZ (U8758) to the XII Corps zone to relieve the 26th Infantry Division. Protection for movement and assembly of this initial division element was provided by Army Antiaircraft units until the 549th Antiaircraft Artillery Automatic Weapons Battalion arrived and was attached to the Division.

The new 90mm fuse PD T74E6, known as the Posit fuse, was released for use on the continent as of 15 December. Initially, notification to higher headquarters was required prior to use of this fuse in each Inner Artillery Zone. On 16 December its use was authorized in the SAARLAUTERN (✠981) Inner Artillery Zone and shortly thereafter it was authorized for use in all other existing Inner Artillery Zones.

For the first fifteen days in December, enemy air activity had been very light. Only sixteen enemy aircraft appeared over the Third US Army area, two of which were shot down.

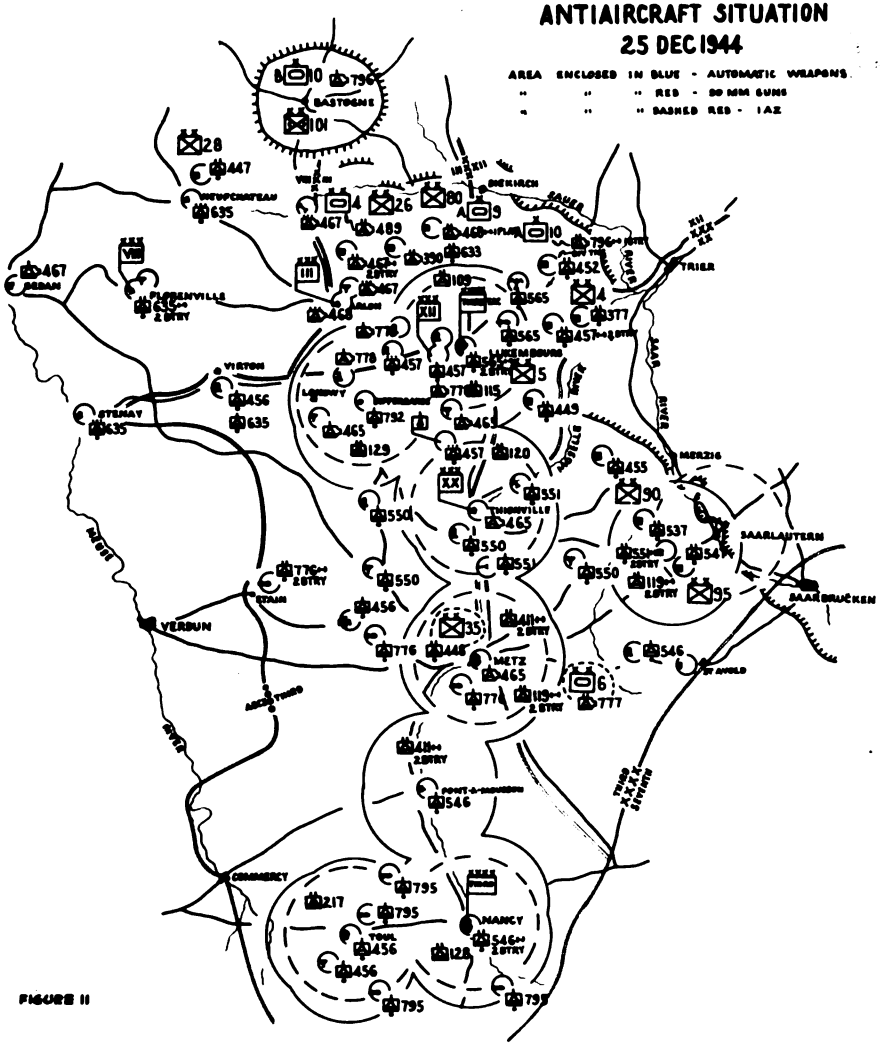

FIGURE 11

Before it had been noted that many unidentified planes were flying at night just above the Inner Artillery Zone ceiling of 10,000 feet, Twelfth US Army Group was requested to approve an Inner Artillery Zone for LUXEMBOURG (P5558) with a ceiling of 15,000 feet. The Twelfth US Army Group modified this request and gave approval for a ceiling of 12,000 feet. This restricted area became effective on the night of 31 December.

On the 29th of December, the German Air Force appeared in strength with eighty eight planes which participated in sixty one raids over the Third US Army area. Antiaircraft shot down ten of these planes and claimed seven probables. The following day, enemy planes restricted their activities mostly to reconnaissance. Two were brought down and three additional planes probably destroyed.

The 567th Antiaircraft Artillery Automatic Weapons Battalion was assigned Third US Army on 30 December and was earmarked for attachment to the 30th Antiaircraft Artillery Brigade as soon as it closed in the Army area. On 31 December the 91th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled), assigned to the Seventh US Army, arrived in Third US Army area to take over defenses at airfields A-90, 95 and 96 in the TOUL (U6411) - NANCY (U8511) area since these fields were being used by the Tactical Air Command of Seventh US Army. In accordance with Twelfth US Army Group policy, the unit was attached to Third US Army for operations and was placed under operational control of the 30th Antiaircraft Artillery Brigade.

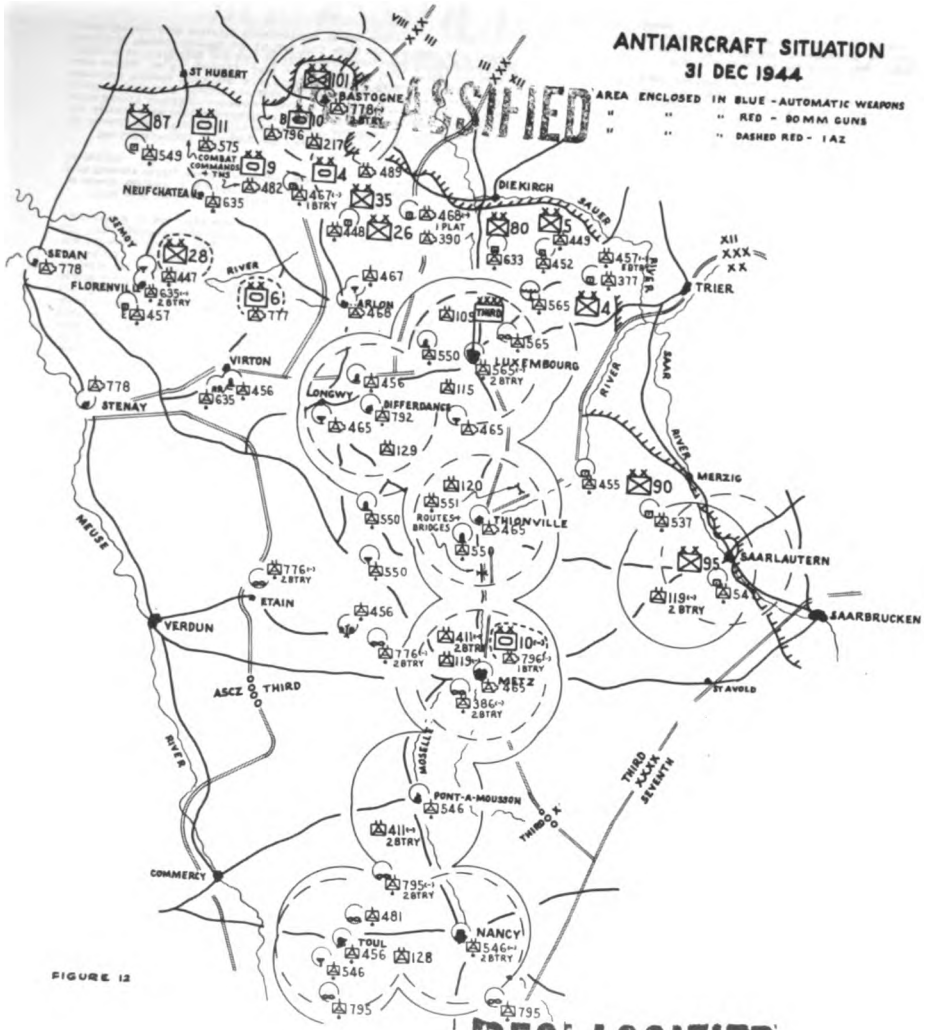
The last day of the month was another day of heavy enemy air action. Sixty four raids, consisting of eighty nine planes, struck at installations throughout the area. Three of the raiding planes were destroyed and four additional planes probably destroyed.

The disposition of Third US Army Antiaircraft Artillery on 31 December, supporting the fighting attack on the Southern flank of the German bulge, is shown in Figure 12.

SUMMARY OF ENEMY AIR ACTIVITY FOR THE MONTH OF DECEMBER.

The month of December saw enemy air activity increased almost tenfold over activity of any previous month, excluding August when 3215 enemy planes were overhead. Although the first three weeks of December brought almost no activity, the enemy air effort from 22 December on was such that by the month's end 729 raids by 1090 enemy aircraft had been tallied, as compared with November's seventy eight raids by 138 enemy aircraft.

As Third US Army regrouped and moved North to strike at the flank of the German counter-offensive piercing its way through Belgium and northern LUXEMBOURG, the skies cleared and the pent up fury of the German Air Force, hitherto so closely husbanded, was unleashed in its full strength. Attacks by as many as 250 enemy aircraft in one day were made.



At the outset, supply installations and traffic moving northward along highways were the main targets. Most attacks were by night. But later, attacks came by day as the German pilots took advantage of the first bright sun in weeks to dive down out of it, bombing and strafing. Most attacks were from low altitudes, some so low that gun battalion radars failed to detect the approaching aircraft, so that automatic weapons played the major defensive role for Antiaircraft.

As the lines became more tangible, target priorities changed and heavy attacks were made upon artillery, troops, vehicles and numb other targets as opportunity presented. Tactics were keyed to harass and hinder, rather than to forestall or destroy entirely. Airfields were frequently attacked by one or two aircraft, flying in low at night to bomb and strafe. Command Posts were lightly attacked, and vehicles parked in fields were frequent targets.

Despite the weight of the effort, however, little damage was done. A few vehicles were destroyed, some men were killed and wounded. But compared with the size of the effort, results obtained were insignificant. The exception to this was the strafing of a Class III dump near MARIENBURG (U6677) where 100,000 gallons of gasoline, some jerricans and bazookas were lost. This was the sole instance where objectives protected by Antiaircraft Artillery were destroyed or even seriously damaged. In most cases, the protection afforded was most successful. And in the course of their engagements, Antiaircraft Artillery claimed 115 enemy planes destroyed and twenty five probably destroyed, with immeasurable other undoubtedly damaged.

For further information the Weekly Intelligence Reports covering the month of December are inclosed as Annex 7.

DECLASSIFIED

CHAPTER 8
JANUARY OPERATIONS

The savage attacks by the Luftwaffe, in the attempt to slow down Third US Army's drive, reached their peak on 1 January when more than 308 hostile aircraft were over the area in 139 raids during the twenty four hour period. Attacks were heavy in the XX Corps zone but the heaviest single attack of the day was on an airfield southwest of METZ (U8858). Here twenty five aircraft came in from all directions at low level and strafed the parked P-47's, twenty of which were destroyed and seventeen damaged. Of the twenty five enemy aircraft attacking however, sixteen were shot down by Antiaircraft Artillery and one more was claimed as probably destroyed.

Other targets most frequently attacked in the Third US Army area were supply installations, traffic, and field artillery and although no material success was achieved by these attacks, the enemy paid heavily. During the twenty four hour period, sixty-three planes were shot down and seventeen more were claimed as probably destroyed by Antiaircraft Artillery. The 146th Antiaircraft Artillery Automatic Weapons Battalion, which was defending artillery in the XX Corps zone, turned in the highest tally for the day. Five units of the battalion claimed sixteen Category I's and six Category II's, which included ten out of a flight of twenty five FW 190's.

The arrival of the 567th Antiaircraft Artillery Automatic Weapons Battalion in the Army area on 1 January increased Army Antiaircraft Artillery sufficiently to permit coverage of all installations considered vital at this time. In addition the Army was able to take over from the Corps the Antiaircraft defense of two bridges in the vicinity of THIONVILLE (U8695) and the supply point at ARLON (V6823).

Plans of the XII Corps for an attack across the OUR River included preliminary close support bombing by medium bombers. Two batteries of the 119th Antiaircraft Artillery Gun Battalion were therefore attached to Corps to draw ammunition and complete necessary data for the firing of a flak line. Arrangements were made to attach an additional gun battalion since the flak line requested would require six gun batteries.

The heavy attacks at 1-2½ brought about the strengthening of Antiaircraft Artillery defenses on the following day to the scale of three Automatic Weapons batteries. One battery of Automatic Weapons from Army was used to augment the two batteries of attached IX Air Defense Command Antiaircraft already at this field.

Enemy air activity continued to be heavy on 2 January but did not equal the violence of the previous days' attacks. Fifty-five raids were made by eighty-six planes. Attacks on supply installations had dropped off, and traffic and Field Artillery appeared to be the principal targets. For the day, Third US Army Antiaircraft claimed seven kills and an equal number of probables.

The 80th Infantry Division had been hit hard in the breakthrough and it became necessary to pull the division out of the line. The combat efficiency of its attached Antiaircraft Artillery Automatic Weapons Battalion, the 447th, was considered satisfactory, however, and in view of the Antiaircraft Artillery shortage the unit was relieved from attachment to the division on 3 January and attached to VIII Corps for defense of installations in the Corps area. One battery was used to augment the 159th Antiaircraft Artillery Automatic Weapons Anti-tank Battalion of the 17th Airborne Division.

The attack by XII Corps had been postponed and the two gun batteries which had been attached for the flak line mission became available for use in their primary role. To the west, ARLON (V6823) had been the target for repeated attacks and on 4 January the two batteries were moved to III Corps for the defense of this city. In order to give the Air Force as much freedom as possible to operate on the ARDENNES bulge, an Inner Artillery Zone was not requested for ARLON (V6823). Instead, arrangements were made with the XII Tactical Air Command to allow the 50mm guns to fire at unseen planes at night upon authorization from the controller at the Fighter Control Center. This arrangement, called a "Blank Check" area, had previously been used in defenses along the MOSELLE River at PONT-A-MOUSSON (U7735).

Digitized by Google

On 4 January one battery of the 782d Antiaircraft Artillery Automatic Weapons Battalion (Semi-mobile), which had been included in the Antiaircraft Artillery defense of the steel mill at ÉTTELBRUCK (P6604) reverted to IX Air Defense Command and one battery of Automatic Weapons from Army was moved to relieve the outgoing unit. This loss of Antiaircraft artillery from units available to cover supply points and other installations in the Army area was increased on 6 January, when the 9th Infantry Division arrived in Third US Army without an automatic weapons battalion. To furnish this division with a unit, it was necessary to relieve the 462d Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) from its mission under 36th Antiaircraft Artillery Brigade.

Since 2 January, enemy air activity had been negligible but the force with which it could strike was not underestimated, and every effort was made to provide adequate Antiaircraft Artillery for all vital points. The retention of the 462d Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) by the VIII Corps, when the 9th Armored Division was pulled out of the line for refitting on 8 January, assisted materially in this respect since the deep zone of the VIII Corps included many far flung bridges and installations.

Movement of the 9th Infantry Division into the XX Corps zone on 6 January strengthened the front considerably, but no major elements were on the line east of LUXEMBOURG (P64LL). The pressure in the ARDENNES bulge, especially southeast of BASTOGNE (P5558) occupied most of our forces. This together with the fact that a number of German divisions were still unlocated, drew considerable attention to the possibility of a German thrust toward LUXEMBOURG (P64LL) or as far south as METZ (U8858). Plans were made therefore to employ Antiaircraft in anti-tank and field artillery roles, if such a threat should materialize. The 16th Antiaircraft Artillery Group, which controlled the defense of LUXEMBOURG (P64LL), coordinated its anti-tank and field artillery plan with the XII Corps. In the METZ (U8858) area, the 36th Antiaircraft Artillery Brigade planned the use of Antiaircraft Artillery for similar missions, coordinating with the XX Corps.

On 9 January, the 634th Antiaircraft Artillery Automatic Weapons Battalion (Semi-mobile) minus one battery, was attached to Third US Army for operational command. This was a Seventh US Army unit which was being employed in defenses at airfields A-70, 95 and 96 in the NANCY (U9511) and TOUL (U6410) areas, all of which were used by the Tactical Air Command supporting Seventh US Army.

The failure of the German Air Force to sustain the scale of attacks set earlier in the month indicated that their violent effort to stop Third US Army's drive had been at least temporarily abandoned. Consequently, the defenses at airfield Y-34 near METZ (U8858) were reduced to the normal scale of two automatic weapons batteries in order that one battery of Army Antiaircraft Artillery could be made available to cover a Class III reserve at LANDRES (U6022).

Return of the 9th Armored Division to the Third US Army area on 11 January without Antiaircraft Artillery made it necessary to relieve the 462d Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) from VIII Corps for reattachment to the division. Antiaircraft Artillery available to Third US Army for protection of vital points was further reduced by the arrival of the 8th Armored Division minus an Antiaircraft Artillery unit. The 467th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was relieved from the III Corps and attached to XII Corps for this division. This change reduced the Automatic Weapons of the III Corps to a single battalion and a readjustment was made in the Automatic Weapons units attached to III and VIII Corps so that the III Corps would have at least one and one half battalions to cover installations in the Corps zone.

With good weather, the German Air Force ventured out on 14 January to attack targets in the XII and XX Corps. Of the eleven planes taking part in these raids, one was destroyed and two additional planes probably destroyed.

Two Antiaircraft Artillery units were lost by the Third US Army on 16 January when divisions were moved into Sixth US Army Group area where the Germans were applying considerable pressure at this time. The 796th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was moved with the 10th Armored Division and the 447th Antiaircraft Artillery Automatic Weapons Battalion went with the 26th Infantry Division, the unit moving on 18 January. Loss of the latter unit which had been attached to VIII Corps required an additional adjustment of Antiaircraft Automatic Weapons between the III and VIII Corps in order that each Corps could protect high priority installations in its area.

Still another unit was lost by Third US Army on 25 January when one more Automatic Weapons Battalion, the 567th, was ordered attached to Sixth US Army Group. Even though Antiaircraft defenses were readjusted, only those installations most vital to the army were protected since sufficient Antiaircraft Artillery was not now available to cover all the important installations.

The swing of the Third US Army to the north had drawn to that area the bulk of supply installations and the supplies which had been formerly stored in the NANCY (U8511) and TOUL (U6410) area had been depleted. Antiaircraft defenses at these two cities were therefore discontinued on 20 January and the units furnishing defense for these two points were moved to the city of METZ (U8658) which had become an important supply center.

The German "Bulge" had been reduced by 21 January and availability of roads in that area reduced the importance of BASTOGNE (P5558) which previously had been at the center of the only available road net. The Inner Artillery Zone at the city was therefore cancelled in order to allow maximum freedom for night operation in that area by the air forces.

On 21 January the 76th Infantry Division arrived in the Third US Army area without an Antiaircraft Artillery unit and it became necessary to further reduce the Antiaircraft Artillery which was available to cover supply installations and other vital points in the Army area in order to provide the 779th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) for the division.

As a result of a change in the Army boundary on 23 January, air fields covered by the units of the 795th and 85th Antiaircraft Artillery Automatic Weapons Battalions (Semi-mobile) were outside of the Third US Army area therefore operational command of these units was relinquished.

In accordance with instructions from Supreme Headquarters Allied Expeditionary Forces, arrangements were made on 29 January to establish a new boundary in the Army area which was to be known as the Army Group Rear Air Boundary. Antiaircraft defense of installations forward of this line was to be the responsibility of the Army. Antiaircraft defense of installations to the rear of this line was to be the responsibility of the IX Air Defense Command. The location of this boundary was to be determined by mutual agreement between the Army Group Commander and the Air Force Commander. The initial boundary agreed upon excluded from the areas of Army responsibility the Ordnance installation and the airfield at ETAIN (U4770) as well as the airfield east of CONFLANS (U6765) and airfield Y-34 southwest of METZ (U8858). Antiaircraft units of the IX Air Defense Command which had been defending these fields and had been attached to Third US Army for operational command, were relieved when IX Air Defense Command took over responsibility for defense of the airfields. Third US Army was to continue to exercise operational control over all Antiaircraft units inside the Army area.

During the month, LUXEMBOURG (P64LL) had been subjected to artillery fire of a strange type on several occasions. Information gathered indicated that the projectile was fin-ed and traveled at a very high velocity. At the request of the Artillery Section, an attempt was made to use radar to locate the source of the firing. One radar set (SCR-584) was set at an estimated azimuth furnished by the Artillery Section, and at an angular height of 17½ mils in order to avoid ground echos and reflections. The plan was to determine an approximate range and then run the narrow gate out to this range, if possible, to try and lock the radar on the projectile in automatic. If this were successful, readings were to be taken at the computor and at the tracking head to give range, azimuth and angular height of the projectile at specified times.

The above experiments were carried on during several shelling attacks. At the initial angular height, several "flicks" were seen which appeared to correspond with the landing of shells in the city but the radar was unable to "lock-on". The angular height was then lowered to fifty two mils in an attempt to pick up the projectiles nearer their source, but flicks then began to appear which were believed due to friendly artillery fire. These flicks appeared for a period of less than one second and did not show any noticeable travel in range which would give an indication of incoming or outgoing direction. No information was secured as a result of these experiments which was of any value in locating the source of enemy fire.

Copies of Weekly Intelligence Reports for the month of January are attached as Annex 84. It will be noted that after 2 January the German Air Force made no appearance in strength and only came over on infrequent reconnaissance flights.

The disposition of Third US Army Antiaircraft units is shown in Figure 13. The ARDENNES breakthrough had been erased and Third US Army installations had been moved to support the drive through the Siegfried line.

CHAPTER 9
FEBRUARY OPERATIONS

Normal lines of communications and supply had been reopened and arrangements were made to relieve some Antiaircraft units which had been temporarily attached to the Third US Army at the time of the breakthrough. The 16th Antiaircraft Artillery Group and the 109th Antiaircraft Artillery Gun Battalion which had been employed in the defense of LUXEMBOURG (P64LL) reverted to First US Army control on the 4th and 5th of February respectively.

The 36th Antiaircraft Artillery Brigade took over the responsibility of the defense of LUXEMBOURG (P64LL) as soon as the elements under its control could relieve the 16th Antiaircraft Artillery Group and the 109th Antiaircraft Artillery Gun Battalion. In order to maintain the two gun battalion scale of defense at LUXEMBOURG (P64LL), the 413th Antiaircraft Artillery Gun Battalion was released from its mission in the defense of METZ (U8659) and moved to LUXEMBOURG (P64LL) on 5 February.

Although impeded by melting of deep snows, and the weather which prevented air support, Third US Army troops were pushing deeper into Germany in the area of the German-Belgium-Luxembourg borders, and further to the south Third US Army troops were advancing favorably. Although Third US Army advances continued, the main effort was assigned to the First and Ninth US Armies, and troops were shifted north in preparation for an offensive. On the 1st of the month the 35th Infantry Division was moved to the Ninth US Army area, taking with it its attached 467th Antiaircraft Artillery Automatic Weapons Battalion attached to the 8th Armored Division was relieved from attachment to Third US Army when this division also moved to the First US Army. Continuing the build-up of troops on 5 February, the 95th Infantry Division and its attached 547th Antiaircraft Artillery Automatic Weapons Battalion moved into the Ninth US Army area.

In October plans had been made for the use of searchlights in the crossing of the river RHINE. As a result, one battery of the 226th Antiaircraft Searchlight Battalion arrived in the Third US Army on 31 January. These searchlights were incorporated in the Antiaircraft defense of LUXEMBOURG (P64LL) until requested by Corps for battlefield illumination for infantry troops.

Searchlights were first used in a ground role in the Third US Army area on the night of 4 February, in a familiarization mission in the XII Corps area. Since the ground troops were not accustomed to night combat under artificial moonlight, a sector was chosen in which no major operation was underway.

A position overlooking the enemy lines along the MOSELLE river was chosen for first employment of searchlights for battlefield illumination. Two lights were emplaced in defiladed sites near the village of CANACH (P5813) to throw a beam over the MOSELLE river in the direction of the German lines. At that time, outposts were established in the town of REMICH (L0312). The hostile shores were illuminated sufficiently to discern objects on the far shore. The 284th Combat Engineer Battalion, which was supported by the searchlights, furnished communication for control. No artillery fire was drawn during the three day period these lights were in operation.

On the second night of the XII Corps attack over the SAUER and OUR rivers in LUXEMBOURG (P64LL), the 5th Infantry Division requested Antiaircraft Artillery Searchlights for battlefield illumination. Two lights were sited in the 11th Infantry sector of the 5th Division for this purpose. The first night the lights were used only ten minutes as too much light was provided, revealing infantry assault boats making the crossing. Necessary adjustments in siting were made the following day and on the second night the lights were used for eight hours. The first reports stated the infantry did not like the illumination. However, after becoming accustomed to the effect of the lights, they requested additional lights. A total of six lights were employed with the 5th Infantry Division by 15 February.

During the hours of darkness progress on bridge construction was slow. Since the bridges were normally under direct observation it was impractical to employ local direct illumination. Indirect lighting provided by Antiaircraft searchlights was more diffused, comparing to the light of a three quarter moon. Our troops were able to see well enough to work, without being observed by the enemy who faced the light reflecting directly upon them from the low hanging overcast. Illumination for bridge construction in the 5th Infantry Division sector was furnished on the night of 13 February at the request of the engineers who reported a material increase in the amount of work accomplished.

DECLASSIFIED

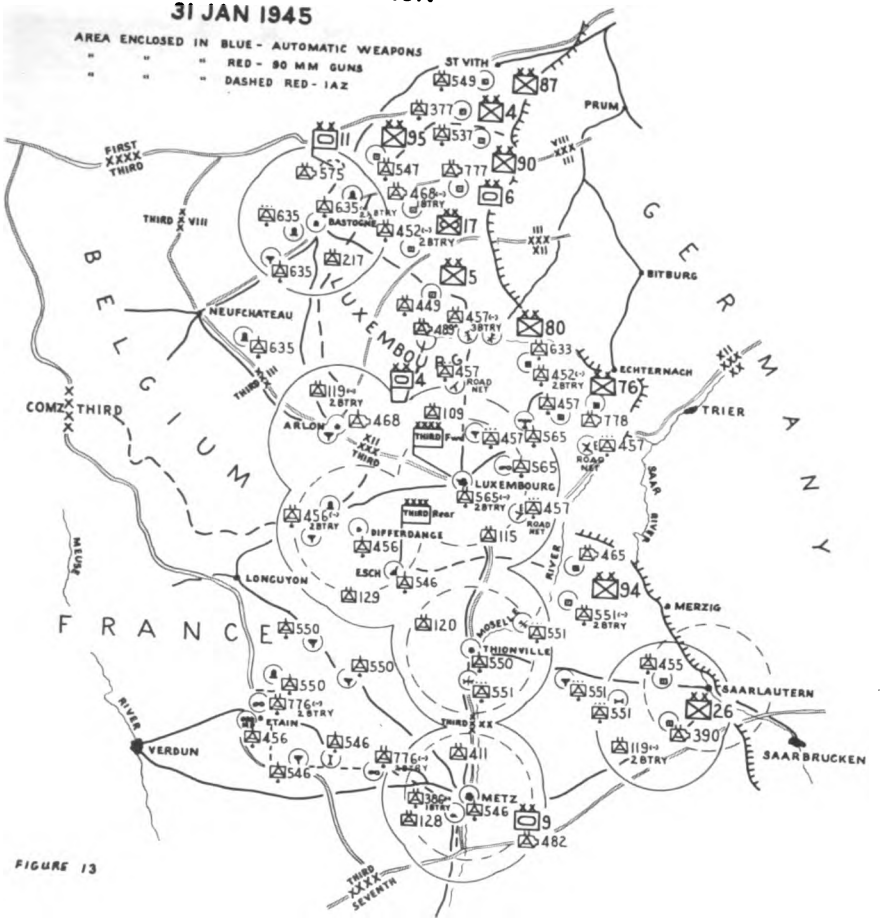

FIGURE 13

During 10, 11 and 12 February, troops of the 26th Infantry Division, in the XX Corps sector to the south, first experienced working with searchlights under battle conditions. The division held a bridgehead over the SAAR river and occupied several blocks of buildings in the town of SAARLAUTERN (Q2980), RODEN (Q2882) and FRAULAUTERN (Q3001). Enemy troops occupied buildings directly across the street. Any movements during the hours of darkness drew small arms, automatic weapons and mortar fire. The S-3 of the 104th Infantry Regiment requested the assistance of searchlights on the night of 10 February to assist our patrols in occupying the outer fringe of enemy held houses which the enemy habitually vacated at night and reoccupied the following morning.

On the night of 11 February the lights were again employed all night at the request of Task Force "A" of the 101st Infantry, which was on the left flank of the 104th Infantry. Having objected to the use of lights on the previous night, they were now accustomed to them and believed they could better conduct mortar fire and motorized patrols.

The 104th Infantry was completely relieved by the 328th Infantry on 12 February during the hours of darkness with searchlights facilitating the relief of troops.

Searchlights were continued in operation on the night of 13 February. However, they were not used on the next two nights as clear skies failed to adequately reflect the light beams.

In the SAARLAUTERN (Q2980) area, a number of night counter-attacks had taken place and on 17 February such an attack was launched against one of the battalions of the 320th Infantry. Searchlights were used and sufficiently penetrated the heavy mist to contribute to the halting of this counter-attack. It was observed that finer adjustment of mortar fire was possible under illumination.

Battlefield illumination by Antiaircraft searchlights was well received by units with which they were employed in the Third US Army area. A typical comment, by the 104th Infantry, is quoted below:

"The experimentation of this regiment with artificial moonlight was highly successful. The results obtained have exceeded expectations. All individuals interrogated from squad leaders to battalion commanders were very favorably impressed with the employment of artificial moonlight. The American soldier will fight anything he can see. This type of illumination lifts the doughboy from a blind groping ineffective, to an efficient, confident and aggressive soldier."

Although generally agreed on the assistance of Antiaircraft lights, Combat Commanders also observed certain limitations. The most serious objection offered was that, when located in buildings or in trenches, enemy troops could observe the movement of friendly troops in the open.

To ascertain the reaction of the enemy, PWs were interrogated regarding the use of searchlights. Generally speaking, PWs had been enjoying a number of the advantages from the lights that our own troops received, but patrol activity by the enemy had been greatly reduced.

As Third US Army Infantry and Armor continued to drive into the Siegfried line east and southeast of ST VITH (P9586), the net work of roads leading from the city bore heavy movement of supplies and troops. The mud and slush from melting snow impeded traffic. ST VITH (P9586) became a logical target for the German Air Force. The BASTOGNE (P5558) road junctions having assumed a more normal status, its Antiaircraft defense was reduced to two gun batteries; an Antiaircraft defense of two gun batteries was accordingly set up at ST VITH (P9586) on 9 February. On 12 February the 50th Antiaircraft Artillery Brigade took over from VIII Corps the responsibility for Antiaircraft defense of BASTOGNE (P5558) and added an Automatic Weapons Battery to the two gun battery defense.

The bridgehead over the OUR river at ECHTERNACH (L0536) was being expanded and, when progress permitted it was planned to establish gun defenses of OUR river bridges in that vicinity. Two batteries of the 115th Antiaircraft Artillery Gun Battalion, relieved by two batteries of the 119th Antiaircraft Artillery Gun Battalion from ARLON (P6222) in the Antiaircraft defenses of LUXEMBOURG (P0,1,4), were moved forward to the vicinity of ECHTERNACH (L0536) on 8 February. The 129th Antiaircraft Gun Battalion was divided between the steel mill at DIFFERDANGE (P66d,) and ARLON (P6222), with two batteries at each point.

On the night of 10 February, memories of a past campaign were revived when Third US Army Antiaircraft shot down an enemy mail plane bearing mail for German troops in the beleaguered ports of ST NAZAIRE (R5665) and LORIENT (Q7921). These two cities formed the remaining pockets of German troops which the Third US Army had

On 10 February Third US Army regained control of the 10th Armored Division and the attached 796th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled). These units were moved to the vicinity of METZ (U8699) and attached to the XX Corps.

A request was received from the Ninth Air Force for protection of a large maintenance depot to be set up at Airfield Y-32C in the vicinity of THIONVILLE (U8605). Defense of the above installation was established with one Automatic Weapons Battery, withdrawn from a supply point of relatively low priority, on 22 February.

Antiaircraft Artillery gun defense of ECHTERNACH (L0536) was established on 14 February with the two gun batteries which had been attached to the XII Corps on 8 February. Although it had been the policy of the Third US Army to establish Inner Artillery Zones at vital river crossings, it was felt that air superiority at this particular time was such that complete restriction of flying in this area was not justified. With concurrence of the Commanding General XIX Tactical Air Command, a Black Check area was established to permit Antiaircraft guns to fire at unseen aircraft when the Fighter Control Center could inform them that no friendly planes were in the area.

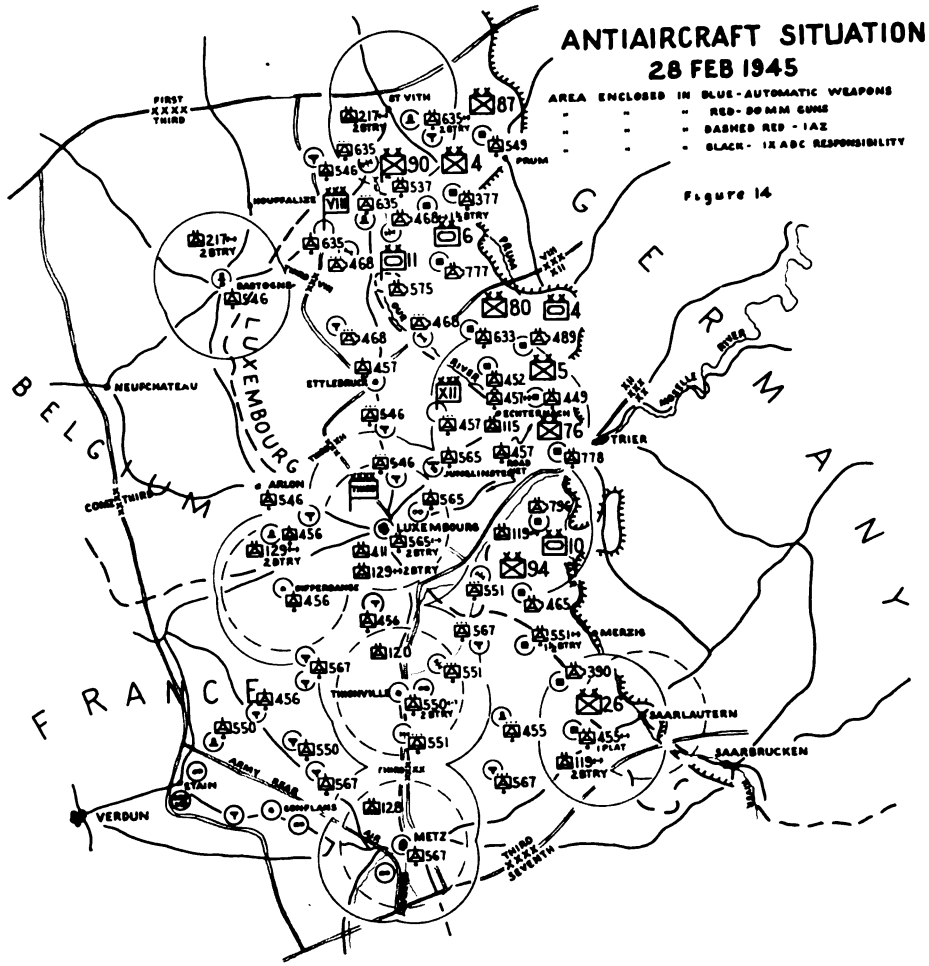
The offensive in the XX Corps was progressing and the SAAR MOSELLE triangle was being cleared. This resulted in the movement of two batteries of the 119th Antiaircraft Artillery Gun Battalion from the defense of LUXEMBOURG (P6414) into the XX Corps sector for Antiaircraft defense in the vicinity of SAARLAUTERN (L1112) on 23 February. The desired scale of gun defenses at LUXEMBURG (P6414) was maintained by taking the two batteries from ARLON (P6222), no longer a vital communications center.

With good weather continuing, the drive in the XII Corps was expanding its bridgehead and build-up of troops across the river. To insure adequate gun defenses for the river crossing in ECHTERNACH (L0536), the two remaining batteries of the 115th Antiaircraft Artillery Gun Battalion were moved forward to this crossing on the 22d and 24th of February respectively, reducing the scale of gun defense of LUXEMBOURG (P6414) to six batteries.

The 367th Antiaircraft Artillery Automatic Weapons Battalion which had been temporarily attached to the Sixth US Army Group was returned to the Third US Army on 27 February. Automatic Weapons defenses of installations in the Army area were adjusted to furnish maximum protection. The addition of this Antiaircraft unit permitted a general regrouping of Automatic Weapons units.

The German Air Force flew no sizable sorties in the area and was content with sporadic reconnaissance flights.

No new tactics were reported. No jet-propelled planes were sighted over the Army area.



Antiaircraft Artillery units claimed three category I's and six category II's. Since the number of enemy planes engaged was a few less than the thirty two reported, these nine claims equal about thirty three percent destroyed or probably destroyed of all enemy aircraft reported.

With the decline in activity of the Luftwaffe an increasing number of ground support missions were fired by Antiaircraft Artillery Automatic Weapons Battalions attached to Divisions.

Figure 14 indicates Antiaircraft dispositions as of 28 February.

Copies of Weekly Intelligence Reports for the month of February are attached as Annex 9.

CHAPTER 10
MARCH OPERATIONS

The assignment of the 66th Infantry Division to the Third US Army without an Antiaircraft Artillery Battalion made it necessary to furnish a unit from the 30th Antiaircraft Artillery Brigade. On 2 March, the 546th Antiaircraft Artillery Automatic Weapons Battalion was attached to the division. A second unit was withdrawn from Army Antiaircraft Artillery Battalion was attached to the 95th Infantry Division when it had also been assigned to Third US Army without Antiaircraft Artillery.

Due to limited activity of the German Air Force and the lessening of the threat to rimal areas, it was felt that restrictions on flying of friendly aircraft over these areas were now unwarranted. Therefore the within the Third US Army area cancelled effective 1 March. Inner Artillery Zones were to be main re jected upon request of Army to German Air Force. Flak-wagon areas were subsist ted at all units defended by 40mm guns.

Having penetrated the Siegfried Line, the Third US Army advanced rapidly along the north portion of the front and by 2 March had expanded its SAAR River bridgehead south of Trier (U8695). By 5 March the 10th Armored Division had pushed into Prüm (U8194), and the 11th Antiaircraft Artillery Gun Battalion w for had been employed at (U8 and B (U8192) was moved forward in the XII Corps area for the defense of this city. On 6 March when the str had been sufficiently cleared, gun defense was established.

The evacuation of Antiaircraft Artillery which had been created by the arrival of the above Infantry Divisions was alleviated by the assignment of the 99th Antiaircraft Artillery Automatic Weapons Battalion and the 16th Antiaircraft Artillery Automatic Weapons Battalion to Army control of the divisions to which they were attached released to the Third US Army Group. On 12 March the 99th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was attached to the 95th Antiaircraft Artillery Brigade to cover missions in the Corps and Army areas.

Advantage was taken of the lull in enemy air activity to make available special tactical missions in the Army area and in the rear of the Corps areas. Through the cooperation of the XIX Tactical Air Command, [illegible] were flown by fighter-bomber pilots simulated low level dive bombing and strafing attacks on Antiaircraft weapons units. Missions were scheduled and flown with marked success however weather conditions permitted.

On 11 March the 32d Antiaircraft Artillery Group was given the task of reconnoitering for a suitable Antiaircraft Artillery Automatic Weapons firing range site and early movement preparatory to operate the range. The loss of the 32d Antiaircraft Artillery Group up to the fifteenth of any aircraft necessitated postponement of these plans.

A change in lateral boundaries enabled the city of [illegible] from the Third US Army area. The 143d Antiaircraft Artillery Gun Battalion which had been defending the city was relieved of its mission on 14 March and prepared to move forward to the vicinity of [illegible] where it was to defend the Rhine River crossing. Plans for this move Arrangements were completed to establish gun work area to permit unseen firing at night when the defense was established.

On 15 March the 127th Antiaircraft Artillery Automatic Weapons Battalion was attached to Combat Command Army with the 11th Armored Division. On 16 March the 126th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was released from the Third US Army and was available as an Antiaircraft unit for the 17th Armored Division which had been assigned to the [illegible] Army Group.

During the initial phase of the drive toward the Rhine River, the German Air Force had failed to attempt to strafe the Antiaircraft units had therefore been employed extensively in a ground role. On 1 March [illegible] of the 143d Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled), supporting a task force of the 90th Infantry Division, [illegible] the town of [illegible] (U8594) silencing enemy troops while under heavy fire and rifle-pit sniper and machine gun fire to capture a bridge intact. The defense of the bridge was quickly organized and it was held intact until the 90th Tank Destroyers and Infantry arrived to take over. Other Antiaircraft units contributed to the Third US Army push by their execution of ground role missions.

The 11th Antiaircraft Artillery Gun Battalion was relieved of its mission at [illegible] (U8793) on 1 March and moved forward to the XII Corps zone. The 120th Antiaircraft Artillery Gun Battalion was relieved from its mission at the steel mill at [illegible] (U8792) on 10 March and the defense of [illegible] (U8415) and moved forward to be [illegible] were to be available immediately for defense of planned [illegible] River crossings, especially they were given the mission of defending the river crossings near the 11th River in the vicinity of [illegible] (U8695).

On 10 March the 71st Infantry Army drove across the Kyll River capturing a bridge intact at [illegible] (U8695) and [illegible] and at this point, the 120th Gun Battalion under control of XII Corps set up its Antiaircraft defenses. Artillery were [illegible] the river further south [illegible] (U8693) and [illegible] (U8695) and were [illegible] covered by automatic weapons battalion attached to Corps and Divisions.

The German Air Force, active over First US Army's [illegible] bridgeheads, displayed relatively little activity over Third Army during the first eleven days of March. On 11 March it continued its attempts, however, only sixteen attempted fighter-bomber columns of the 4th Armored Division, a mere [illegible] of the corps' strength, were subject to fourteen attacks. On 14 March, Antiaircraft artillery shot down seventeen planes and probably destroyed three others. During the following two days, the remains of the German air attack lessened, although eight planes were shot down and ten more claimed as probables.

On the south, XX Corps' columns, rolling up the Siegfried Line and destroying German static positions, drew equal attention from the Luftwaffe. When it appeared that RHINE bridges might be captured, the Antiaircraft Officer of the XX Corps requested a gun battalion be made available at the earliest possible date. The 120th Antiaircraft Artillery Gun Battalion, which was divided between DIFFERDANGE (P6604) and THIONVILLE (U8585) had been alerted for movement on short notice. Upon being relieved by units of the 51st Antiaircraft Artillery Brigade at DIFFERDANGE (P6604), the 120th Antiaircraft Artillery Gun Battalion was moved forward on 22 March to the vicinity of ALZEY (M2726), where large quantities of ordnance and engineer equipment were expected to accumulate. Under the control of the 30th Antiaircraft Artillery Brigade, the 120th Antiaircraft Gun Battalion and other Antiaircraft units which were moving forward in preparation for the river crossing were given the temporary mission of protecting the equipment.

On 23 March, armored spearheads of the Third US Army had driven deep into the Seventh US Army zone. As a result, the 10th and 12th Armored Divisions and their attached 376th and 57th Antiaircraft Artillery Automatic Weapons Battalions (Self-propelled) were attached to the 63rd Infantry Division. On the same date the 77th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) reverted to Third US Army control from [illegible] Army Group. The Antiaircraft situation as of 23 March is shown in figure 15.

When CI [illegible] (M4644) was chosen for the site of the river crossings for the XII Corps, a [illegible] area was initially established to allow unseen fire at [illegible]. Because of the importance of this crossing, a request was [illegible] made for an Inner Artillery Zone with a ceiling [illegible] a radius of 10,000 yards through which the flight of friendly aircraft would be prohibited at night.

On the 24th, the enemy made the heaviest air attacks experienced by Third US Army troops during the entire campaign. Attacks were made [illegible] the entire front, principally on the [illegible] (M4644), [illegible] (M4644) and [illegible] areas to the north with [illegible] and 4th Infantry Divisions [illegible] aircraft, including jet-propelled [illegible] were [illegible] and [illegible] attacks. A total of 331 aircraft [illegible] the XII Corps zone. Antiaircraft, especially [illegible] and [illegible] installations, shot down twenty-five attacking planes and claimed several more as probably destroyed.

On the 25th of March troops of the 5th Infantry Division began [illegible] over the [illegible] River at [illegible] (M4644). An additional Antiaircraft artillery, the [illegible], had been attached to XII Corps for the [illegible]. [illegible] and 120th Antiaircraft, which had been held [illegible] for this crossing, initially was a [illegible] antiaircraft defense. The [illegible] effectively achieved tactical surprise. The Luftwaffe made no [illegible] the [illegible] first [illegible] of the morning; then it struck in force at [illegible]. Of 175 attacking enemy aircraft, eighteen were shot down [illegible] were probably destroyed, and [illegible] remained intact. Two [illegible] were shot down by XII Corps Antiaircraft gunners [illegible] were made against the 14th Armored Division and field [illegible] installations.

On 26 March the German Air Force continued to concentrate its efforts [illegible] the crossings in the XII Corps zone. Again Antiaircraft scored [illegible] shot down twenty-six of the 150 attacking planes and [illegible] probably destroyed six additional planes. On the following day, the [illegible] was made on the bridgehead tank plane when [illegible] aircraft [illegible] and installations. Antiaircraft artillery destroyed [illegible] outside of the restricted zones and claimed twenty-three probables. [illegible] were shot down by air-and-ground fire from [illegible] made five [illegible] of twenty feet to 1,500 feet. Strafing followed [illegible] attacks. Only three planes [illegible] over the remainder of the XII Corps zone, one of which was destroyed and another probably destroyed. [illegible] losses to the German Air Force, averaged with the loss of [illegible] and [illegible] destroyed by Third US Army's advancing [illegible] and [illegible] the threat to the bridgehead which had now [illegible] with [illegible]. The Inner Artillery Zone with a radius of 10,000 [illegible] of the Corps was established for the OPPLN and [illegible] was cancelled considerably in the defense.

Following close behind the establishment of the bridgehead at [illegible] (M4644), the XII Corps sent troops of the 5th Infantry Division [illegible] the [illegible] River at [illegible] (M4644) on 24 and [illegible] the 90th Infantry Division made [illegible] on 27 March [illegible] (M4644) on 28 [illegible] Troops [illegible] at three points [illegible] and 120th Antiaircraft [illegible] Battalions and the [illegible] and 120th Antiaircraft Artillery [illegible] were [illegible] to the [illegible] Division and [illegible] Battalion [illegible] Antiaircraft Artillery [illegible] were attached to [illegible] Division [illegible] Antiaircraft Artillery [illegible] Division [illegible] Antiaircraft Artillery [illegible] Division [illegible] Antiaircraft Artillery

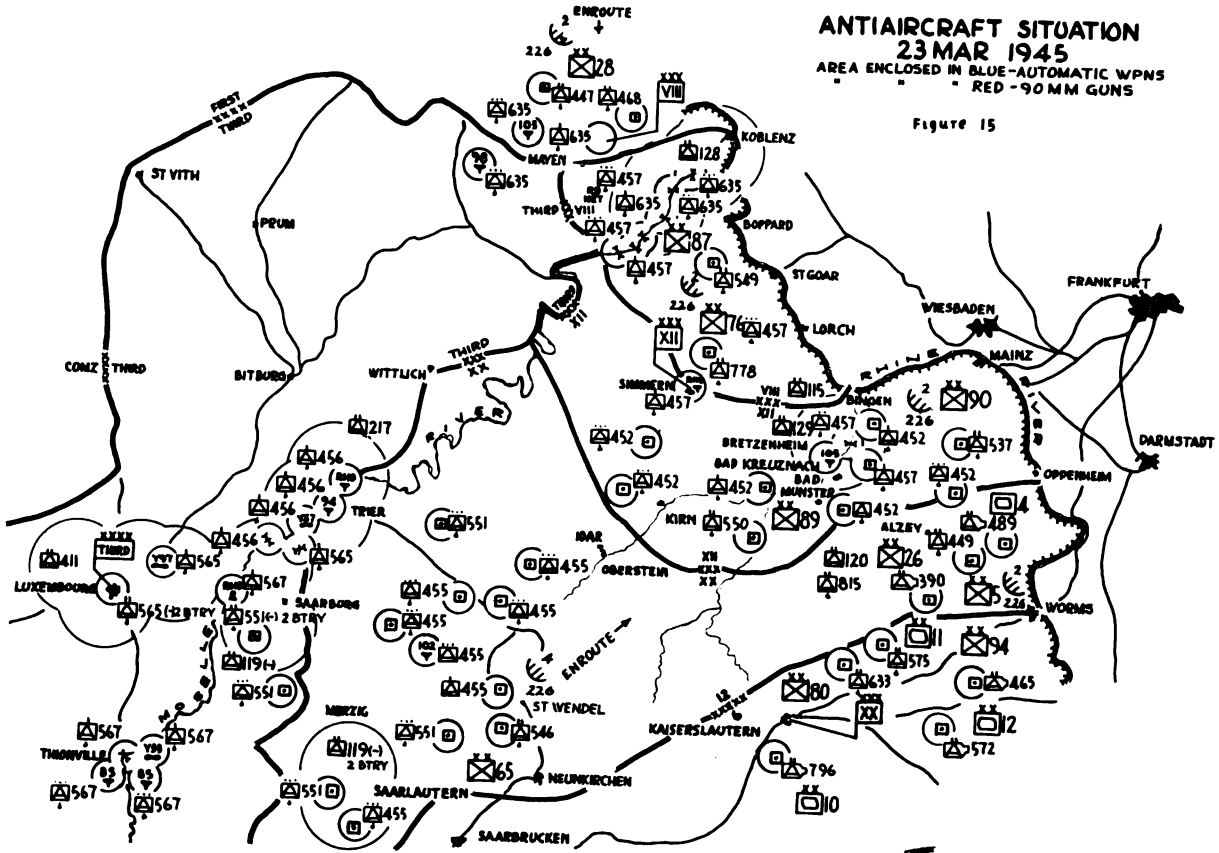
Enemy Air Force efforts at BOPPARD (L9081) and ST GOAR (L9072) was confined to less than thirty planes of which four were shot down and three probably destroyed during the first five days of the operation.

The Third US Army forward Command Post was moved from LUXEMBOURG (P6413) to OBERSTEIN (L7123) Germany on 27 March and an Automatic Weapons defense established there with two batteries of the 456th Antiaircraft Artillery Automatic Weapons Battalion.

A fourth crossing of the River RHINE at MAINZ (M3950) was made by the XX Corps on 27 - 28 March by troops of the 80th Infantry Division. Army units, the 119th and 141th Antiaircraft Artillery Gun Battalions and the 567th Antiaircraft Artillery Automatic Weapons Battalion, had been attached to the XX Corps for this crossing. A Rhinebeck area was established there effective the night of 28 March until an Inner Artillery Zone became effective. Enemy air activity over this bridgehead was very light.

Third US Army's sweep across the RHINE toward the heart of Germany had produced supply problems similar to those which existed after the AVRANCHES (T2718) breakthrough in August. Lines of communication were extremely long and every available truck was needed to move supplies forward and prisoners of war to the rear. A large number of trucks were made available for twenty-four or forty-eight hour trips and thousands of tons of badly needed supplies were moved by Antiaircraft Artillery units.

On 30 March the 146th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) was relieved of its mission under VIII Corps and assembled in preparation for its transfer to Fifteenth US Army on 1 April. The Antiaircraft Artillery situation as of 30 March is shown in Figure 15.



The attachment of the bulk of Army Antiaircraft Artillery to the Corps for the RHINE River crossings left undefended many important installations in the Army area. Some of these in the rear of the Army area were taken over by Antiaircraft units of the IX Air Defense Command. Others remained undefended. The vulnerability of the bridges and bridgeheads and also the belief that the Luftwaffe would mass its strength there, justified the risk which was taken.

By 31 March the 38th Antiaircraft Artillery Brigade had taken over from the Corps the mission of protecting all crossings of the RHINE River as well as important installations west of the RHINE. Corps Antiaircraft Artillery Groups, moving forward, set up defenses along the MAIN River for airfields on which gasoline was being landed by the Air Transport Command and for other important installations.

The arrival of the 70th Infantry Division provided an additional Antiaircraft Artillery Automatic Weapons Battalion which was placed under operational command of the 38th Antiaircraft Artillery Brigade on 31 March. Under an existing directive this battalion could only be employed on the west bank of the RHINE River. The 70th Infantry Division was charged with ground security to the west of the RHINE River, including the crossings, and all Antiaircraft Artillery on the river, including radar and searchlights employed in river surveillance, was coordinated with the Division Plan.

The month of March marked the first appearance of jet-propelled aircraft over Third US Army area in any numbers as Me-262s and Ar-234s became commonplace. Flights as large as six and larger flights of mixed jet and standard type aircraft were encountered.

Copies of Weekly Intelligence Reports for the month of March are attached as Annex 10.

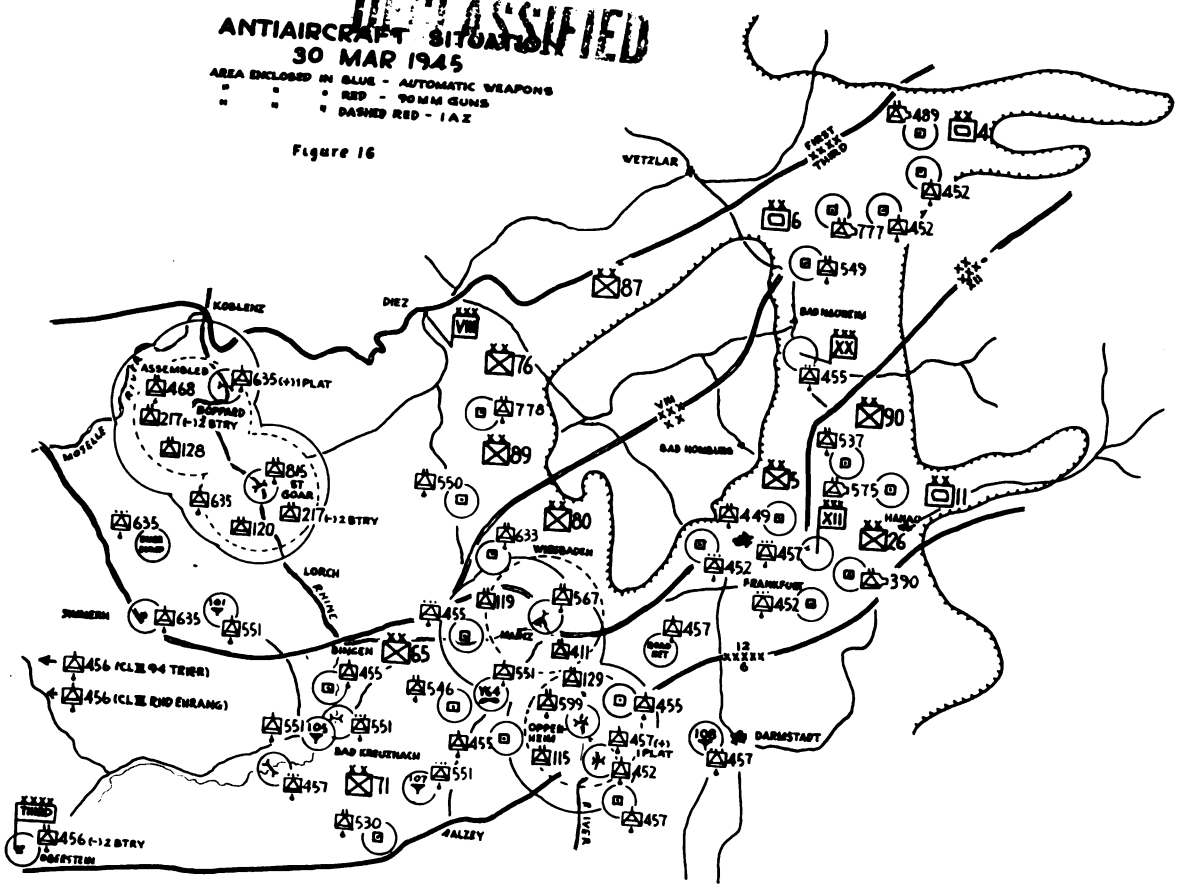

Figure 16

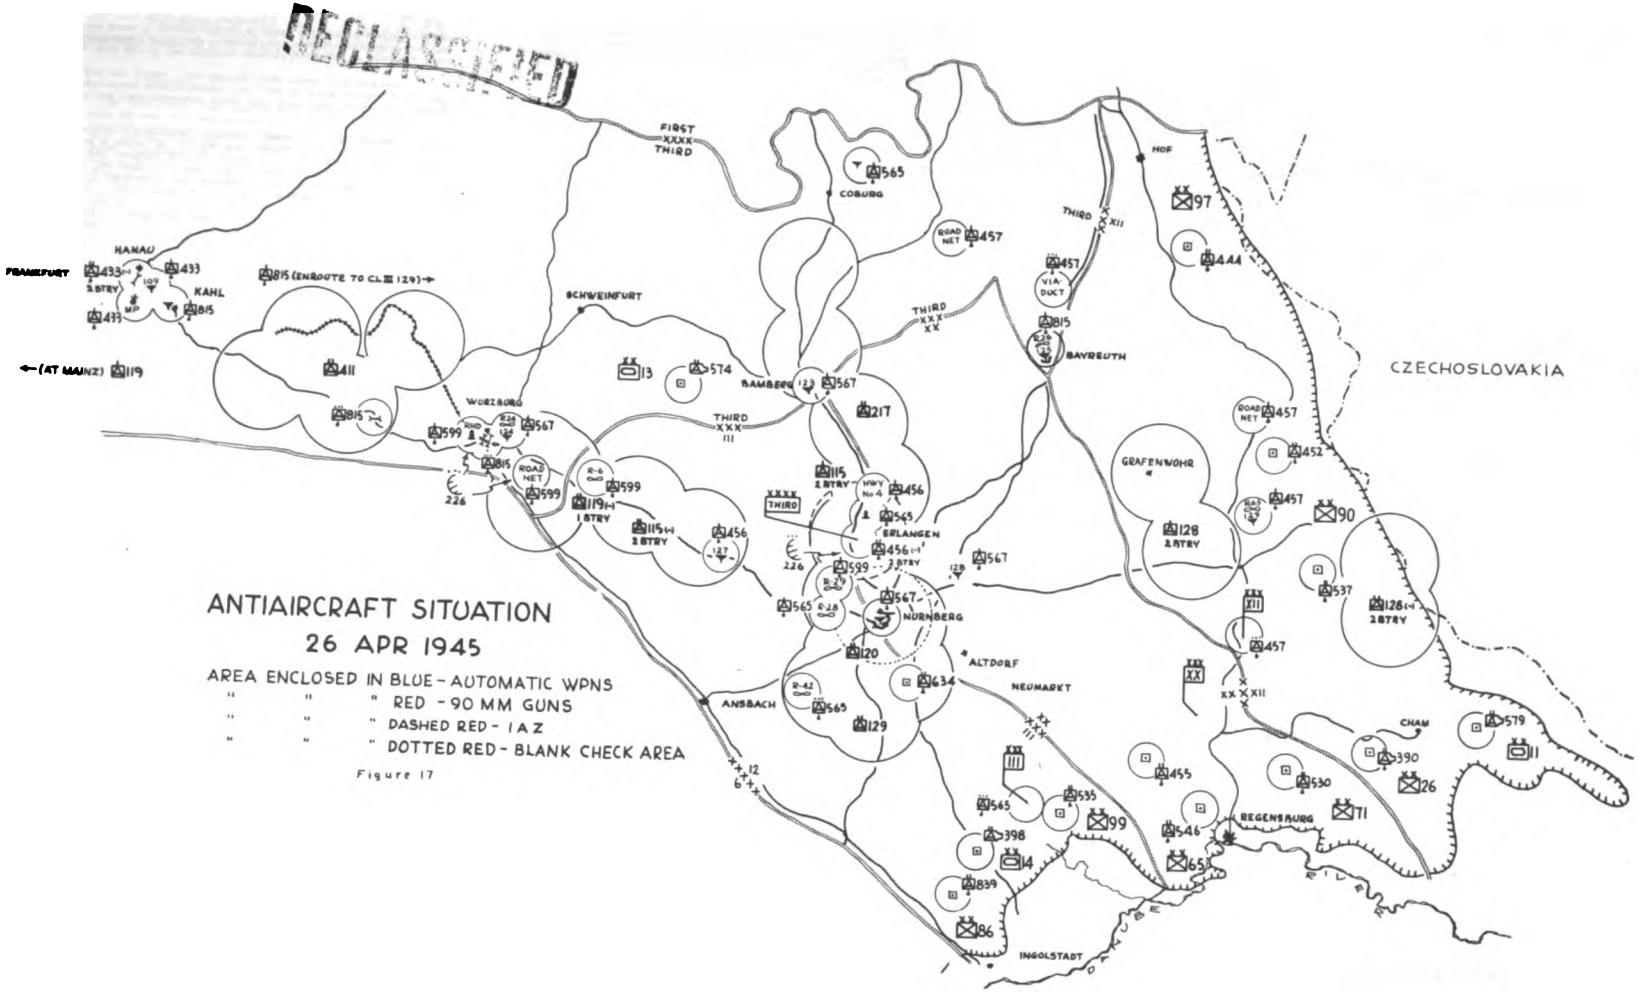
CHAPTER 11
APRIL OPERATIONS

At the beginning of the month the enemy decreased his efforts to interrupt traffic over the RHINE and MAIN Rivers. Instead, frantic efforts were made to brake the advance of the 4th, 6th, and 11th Armored Divisions, all of which were thrusting prongs deep into the center of Germany. The change in enemy tactics proved costly as evidenced by the 2 April reports of the 489th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) which claimed thirty-five enemy planes destroyed and five probably destroyed during the twenty four hour period. In the entire Army area, sixty-seven enemy planes destroyed and twenty-three probably destroyed were claimed for the same period.

The abandonment of the BOPPARD (L8983) crossing, and the expected opening of the bridges at LORCH (M0560) and BINGEN (M1353) necessitated the reorganization of defenses on the RHINE River. On 3 and 5 April the entire defense of the BOPPARD (L8983) crossing was discontinued and the units moved to establish the defense of the LORCH (M0560) crossing at a scale of one gun battalion and one automatic weapons battalion. On 4 and 5 April, two gun batteries from the OPPENHEIM (M4441) crossing were moved to the BINGEN (M1353) crossing and on 4 April this gun defense was augmented by two automatic weapons batteries. Inner Artillery Zones were established at the BINGEN (M1353) crossing on 6 April, and at the LORCH (M0560) crossing on 4 April. The zone at BOPPARD (L8983) was cancelled on 3 April. Two automatic weapons batteries were moved from OPPENHEIM (M4441) to the MAINZ (M3956) crossing on 5 April to balance defenses between these two major crossings.

On 5 April, the 574th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) which had been defending supply points and installations in the Army area was released to the 13th Armored Division and the 551st Antiaircraft Artillery Automatic Weapons Battalion, which had just been relieved of defense of bridges at BAD KREUZNACH (M1640) by the IX Air Defense Command, was placed under control of the Provost Marshal, Third US Army. Although there were many installations at which use could be made of the 551st Antiaircraft Artillery Automatic Weapons Battalion, the need for additional troops to provide security was urgent enough to make the change necessary.

As the 4th Armored Division drove through the THURINGIA Forest and the other armored divisions continued their rapid progress, uninterrupted delivery and supply of gasoline became a matter of great concern. The defense of the airfield terminals constituted an important part of the Antiaircraft activities throughout April. The 5th Infantry Division, being temporarily on a security mission, its Antiaircraft unit, the 469th Antiaircraft Artillery Automatic Weapons Battalion, was placed under operational command of the 38th Antiaircraft Artillery Brigade on 6 April and assigned the mission of protecting airfields. On 8 April the 5th Infantry Division moved north out of the Third US Army area and the antiaircraft artillery battalion was released from its mission. Defenses on the RHINE at MAINZ (M3956) and OPPENHEIM (M4441) were decreased by two automatic weapons batteries each in order to replace the battalion on the airfields.



The importance of giving protection to airfields used by C-47 transports carrying gasoline was illustrated on 10 April when enemy planes attacked C-47s coming in to the LANDSBERG (JO48) airfield. Two C-47s were attacked and destroyed while they were out of range of the antiaircraft protecting the airfield. As the flight of transports came closer, the attacking fighters were engaged by the antiaircraft unit protecting this field and were driven off, thereby preventing further damage.

Further reduction of the defenses on the RHINE River was necessary on 8 April to provide antiaircraft units for several new missions. Two gun batteries and one automatic weapons battery were required for the Forward Third US Army Command Post which was scheduled to move from FRANKFURT (M6768) to HERSFELD (N4053) in a few days. Two gun batteries and one automatic weapons battery were required for river crossings at EISENACH (N8068). Third US Army troops had discovered a mine in the vicinity of MERKERS (M6850) where gold and art treasures were stored; two gun batteries and one automatic weapons battery were necessary for this defense. Antiaircraft units furnished a task force on 15 and 17 April which provided protection for movement of the gold and art treasures out of the mine to the rear area. To provide these organizations, the gun defenses at OPPENHEIM (M4441) and MAINZ (M3956) were each decreased by two gun batteries; this change left a full gun battalion at OPPENHEIM (M4441) and six gun batteries at MAINZ (M3956). The gun defenses at LORCH (M0560), consisting of four gun batteries and four automatic weapons batteries, were decreased fifty percent as it became apparent that the approaches to the bridge were inadequate, and the crossing would be abandoned.

To the west in the zone of the III Corps, responsibility for Antiaircraft Artillery defense of the ISAR River crossings was taken over by Army on 5 May; the 119th Antiaircraft Artillery Gun Battalion reverted to Army Control. The 115th Antiaircraft Artillery Gun Battalion had been attached to III Corps to cover the INN River crossing and was moving south to an assembly area.

V Corps was placed under control of Third US Army on 5 May. Attached to the 115th Antiaircraft Artillery Group, operating under V Corps, were the 140th Antiaircraft Artillery Automatic Weapons Battalion (Self-propelled) and the 460th Antiaircraft Artillery Automatic Weapons Battalion. Attaching the Corps brought also the 103d, 111th and 462d Antiaircraft Artillery Automatic Weapons Battalions attached to the 1st, 97th and 2d Infantry Divisions and the 571st and 482d Antiaircraft Artillery Automatic Weapons Battalions (Self-propelled) attached to the 16th and 9th Armored Divisions.

Until V-E Day, 8 May, Third US Army continued to surge forward to the southeast into Czechoslovakia and Austria. During the period, an estimated 110 enemy aircraft were over the area in a series of approximately ninety raids with the Luftwaffe reluctant to remain on the ground until the final day. Of these, nearly all planes were engaged in reconnaissance missions. Only four attacks were reported. A Ba-181 reconnaissance craft dropped two small anti-personnel bombs (perhaps hand grenades) in the 80th Infantry Division area; two Me-109s strafed in the 26th Infantry Division area; and on the final day -- 8 May --- fifteen enemy aircraft strafed in the vicinity of PASSAU (Q22 12) and DEGGENDORF (U8338). In the strafing attack on PASSAU (Q22 12), two reconnaissance type ships used machine pistols fired out of the cockpit. Many were shot down and a number of pilots and passengers killed. In all, Antiaircraft claimed forty-seven aircraft destroyed and twelve probably destroyed.

Some of the reconnaissance ships shot down were loaded with explosives and detonating caps intended for use of pilot saboteurs who were to land behind our lines. This fairly large scale plot aborted.

As the last day of the campaign entered the pages of history, Third US Army Antiaircraft Artillery reported 6192 enemy planes over the area in 2163 raids since 1 August 1944. Of these 1081 were claimed as destroyed and 564 more as probably destroyed.

AAA Weekly Intelligence Report Number 41 covering the period from 0600B May to 0900B May is included as Annex E.

DECLASSIFIED

CHAPTER
LESSONS LEARNED & CONCLUSIONS

TACTICS

1. EMPLOYMENT. With relatively few exceptions, enemy tactics were to make small-scale hit and run attacks on targets of opportunity throughout the area. In most instances a relatively light concentration of Antiaircraft Artillery fire was sufficient either to destroy or drive off the attacking aircraft. Where targets of vital importance presented themselves, however, attacks by enemy planes were made in large numbers and were pressed regardless of casualties. Where the enemy is not aggressive and has shown a disinclination to launch large scale attacks, defenses may be lightened to cover many objectives. A few batteries under such circumstances will be adequate to drive off light attacks. On the other hand, where objectives are of vital importance, sufficient concentration must be provided to meet irresistified attacks.

2. AUTOMATIC WEAPONS FIRE ON UNSEEN TARGETS. Firing of automatic weapons at unseen targets was wasteful of ammunition and had no apparent deterrent effect on attacking planes. In addition, the tracer streams disclosed the gun position and outlined the target area. No barrage fire was employed by Third US Army Antiaircraft Artillery units. With the present equipment, automatic weapons are of little value unless the target can be seen.

3. GROUND COMBAT. During the campaign many Antiaircraft Artillery units engaged in close combat with enemy ground or mechanized troops either in its own defense or while in an offensive supporting mission. Such engagements occasionally resulted in excessive casualties and loss of equipment due to lack of training for this type of combat. Greater emphasis should be placed upon training of Antiaircraft Artillery personnel for ground support missions and in the role of an infantry soldier. The training required is not so much in shooting as in moving into and occupying positions.

ANTIAIRCRAFT ARTILLERY INTELLIGENCE SERVICE

Two methods of identification were provided, i.e., IFF (Identification Friend or Foe) and identification through flight plans or liaison officer. Neither proved successful, many targets being carried as unidentified. Frequently the IFF equipment was not used by friendly aircraft. Communications provided for the dissemination of Air Warning by Antiaircraft Artillery units was inadequate. Transmission of warning was accomplished with equipment supplied in excess of Tables of Organization and Equipment by the Air Force and Army Signal Officer. Early warning would not be necessary for antiaircraft units except to alert gun crews, if a satisfactory means of identification for guns and automatic weapons units were provided. Units lacked training in establishment of local Antiaircraft Artillery Intelligence Service nets, and procedures evolved in the field differed considerably, often making difficult the coordination of Antiaircraft Artillery Intelligence Service between adjacent units. Mutual identification between aircraft and ground units is vital to efficient operation of the Air Force and Antiaircraft Artillery. Communication equipment for the dissemination of air warning should provide two-way radio communication for the exercise of operational control. Antiaircraft Artillery Intelligence Service training should be standardized. Nets for transmitting this information should be specified and personnel indoctrinated and trained accordingly.

AUTOMATIC WEAPONS

1. MINE DETECTORS. Antiaircraft units normally occupied positions not previously swept for mines by Engineer units and each gun section had to clear its own area of mines. Mine detectors should be provided for each automatic weapons fire unit.

2. SECURITY AND OBSERVATION. The normal disposition of automatic weapons in the field was such that each halftrack, 40mm gun and type M51 mount had to provide its own security and perform its own observation. Bazookas and field glasses should be provided for each 40mm gun, type M51 mount and halftrack.

3. FIRE UNITS. In the majority of situations the towed automatic weapons mounts were greatly handicaped in furnishing convoy protection and in occupying positions. The separate fire control equipment which required orientation and frequent adjustment proved to have distinct disadvantages. Fire control equipment proved unsatisfactory for coping with normal zeros targets. No provision was made for unseen fire or to illuminate targets.

Throughout the campaign, automatic weapons were employed for both offensive and defensive missions in a ground role. Difficulty in this role was encountered due to the unsuitability of fire control equipment for direct and indirect fire plus the inability of antiaircraft weapons to depress below zero degrees in elevation, and fire in travelling position to the front. All automatic weapons should be Self-propelled. A more effective built-into-the-carriage system of fire control is required. Provision should be made for fire during darkness. Automatic weapons should be designed to perform useful and necessary secondary ground missions. Sufficient armor and mobility to perform such a role as well as scales and sighting equipment for indirect fire should be provided. Weapons should be designed to fire below zero degrees through 360 degrees.

ORDNANCE

Mixed lots of 90mm ammunition were common and required continual planning on the part of Battery Commanders to insure availability of a sufficient number of rounds of the same lot for check fire and engagement of aircraft. Provisions should be made for ammunition to reach ammunition supply points with a minimum of lot numbers. Supervision must be exercised by antiaircraft officers to insure the fewest possible lot numbers at each battery position.

EQUIPMENT

1. RADAR. The type SCR 584 radar was not fully dependable for detection of enemy aircraft, particularly low flying targets. It was necessary to take the set off search to make circuit checks. Supply of spare parts for the SCR 584, especially spinner motors and T-R tubes, proved entirely inadequate. Search feature of SCR 584 requires modification or redesign to provide better search coverage against low flying targets. Built-in test equipment to enable checks during search operation would be advantageous. More adequate supplies of spare parts should be provided.

2. HEIGHT FINDERS. Height finders of 90mm batteries were not used by Third US Army units during operations on the continent. They should be eliminated from Tables of Organization and Equipment.

3. TYPE M-7 GENERATOR. Supply of spare parts for type M-7 Generators proved entirely inadequate to permit the required hours of operation. The additional load resulting from the energizing of the remote control systems of one or more guns, frequently caused the output voltage to fluctuate to such an extent that the radar beam went off the air and the target was lost. Supply of spare parts for type M-7 Generators, especially piston rings, valves and over size pistons should be increased. Facilities should be provided for reboring cylinders. Voltage regulators should be modified or redesigned.

4. TYPE M-4 TRACTORS. Type M-4 Tractors proved unable to maintain traction under conditions of icy roads and packed snow. Attachments should be provided for tracks of type M-4 tractors to enable them to maintain traction under icy conditions.

5. COMMUNICATIONS EQUIPMENT. Due to rapidly changing situations, radio proved to be the primary means of communication, with wire used infrequently. Radio equipment provided by Tables of Organization and Equipment however, proved inadequate in quantity and performance. The type SCR 593 radio was totally unsatisfactory; it was difficult to tune and lacked satisfactory provision for maintaining power. The range of the type SCR 543 radio proved insufficient to meet normal needs. The type SCR 177 radio was found difficult to keep on frequency and its range was frequently inadequate. Wire communication was used where possible. The fact that Tables of Organization and Equipment of Self-propelled units made no provisions for wire or telephone proved a distinct handicap in communication with supported elements. Radio is the primary means of communication for antiaircraft units in the field and more dependable radio equipment [illegible] longer range should be provided in sufficient [illegible] command and intelligence nets. Adequate communication [illegible] provided each Self-propelled unit for wire [illegible] of supported elements.

AAA WEEKLY INTELLIGENCE REPORT NO 1

Period:
0112000B to 0106000B

1. This report covers the period 1200B 1 August (when Third US Army became Operational) to 0600B 4 August 1944.

2. Battalion reports, giving details of engagements, have not all been received. Hence this report is incomplete and based only on such Battalion reports as have been received, plus consolidated raid reports submitted by Groups and Brigade, for the period 0600, 3 August to 0600, 4 August.

3. Most hostile air activity has been at night, centering over bridges and roadways south of AVRANCHES. Most attacks have been from low altitudes, with some bombing from medium altitudes. "Window" has been dropped extensively but has not effected radar tracking. Several low-level bombing and strafing attacks have been made but reports indicate no material damage to vital dam, bridges and roads protected by Antiaircraft Artillery.

4. Consolidated raid report 0600 3 August to 0600 4 August is as follows:

	RAIDS	NO E/A	CAT I	CAT II
(0600 3 August to 0600 4 August)	21	159	14	8

5. Battalion reports received late will be summarized in the following week's report.

For the Commanding General:

16 August 1944

AAA WEEKLY INTELLIGENCE REPORT NO 2

Period:
0106000B to 1106000B

1. Summary of Activity

a. Heaviest GAF activity during the week was aimed at lines of communication, repeated heavy attacks were made upon bridges over the SEULNE RIVER near PONTAUBAULT and DUCEY, with particularly heavy raids upon the bridges bottlenecking traffic near AVRANCHES. The area between DUCEY and ST HILAIRE DU HARCOUET have been attacked several times, as has RENNES. Heaviest activity was reported the night of 7 August, with 186 raids by 250 enemy aircraft. AAA defense of bridges and dams has been uniformly successful, and no damage to these targets has been reported.

b. Antiaircraft Artillery claims 63 Cat I's and 34 Cat II's for the week, or approximately 9% of all E/A reported. Corrected totals from 1200B, 1 August, to 0600B, 11 August, (still incomplete) bring reported totals to:

	RAIDS	NO E/A	CAT I	CAT II
1200B, 1 August to 0600B, 11 Aug	176	1280	89	39

Total Cat I's and II's equal just 10% of all E/A reported.

2. GAF Tactics Notes

a. Attacks have been made almost exclusively at night, between the hours of 2200 and 0430, with a few earlier and later. Bridges have been most frequently attacked, about 58% of attacks being against bridges. Known targets of next importance have been Field Artillery at approximately 7%, and AAA positions at approximately 6%. A few strafing attacks against highway convoys have been reported. The attacks against AAA sites ordinarily employed anti-personnel fragmentation bombs, followed by strafing, which caused some casualties.

Altitudes of attack naturally vary, but most night attacks are made from medium and low altitudes, with some strafing efforts reported. High-altitude bombing is infrequent and dive-bombing, also, has been infrequently employed.

Reports indicate some glide-bombing, with motors cut on the approach to the area attacked.

Planes usually attack singly or in small groups of 2 to 15. In instances, as many as 75 E/A have made single attacks on the same objective, approaching from all directions. Reported speed estimates run roughly from 300 to 400 mph, with a few slower.

One battalion reported that, on an enemy night raid, one E/A apparently marked the target area with a light smoke ring through which other planes dropped their flares. Flares are reported as used on most night raids, both to illuminate and to signal other E/A. Some night strafing has been done with non-tracer ammunition, making location of E/A difficult for automatic weapons units.

Two FW 190's were reported over RENNES painted with allied invasion stripes.

"Window" is frequently reported, with considerable flashing on the range tubes resulting. But targets have been readily tracked through it.

b. Extracts of a letter from the 21st AAA Group commander to the CO, 38th AAA Brigade, give an interesting outline of a GAF tactic:

"1. The following tactics employed by the German Air Forces over the AVRANCHES-LA HAYE PESNEL area during the nights of 6, 7, and 8 August have been observed:

a. Employment of one (1) or two (2) fighter planes at altitudes between 1000 - 3000 feet. Formation of bombers follow at 10,000 to 15,000 feet.

b. The fighters fly very low to encourage engagement by our light AA. Some fighters have been observed to flash on searchlights. If light AA fire, the DA is exposed by tracer streams. Immediately the defense zone is indicated, then bombers drop pathfinder, chandelier and parachute flares. High-level bombing follows within our defense zone.

c. The nights of 7 and 8 August 1944 observations were made of engagement of enemy planes by heavy AA. Firing treserless projectiles, the heavy AA do not reveal their defense zone. The low cruising enemy fighter strafed at random in the immediate area and was successful in attracting light AA fire. The procedure outlined in paragraph 1a followed.

d. During the nights of 7 and 8 August 1944, a low cruising fighter attracted machine gun fire from the center of a DA. Very shortly, flares dropped were engaged by light AA. High-level bombing, out of light AA range, followed immediately."

F. R. CHAMBERLAIN, JR,
Colonel, CAC,
Antiaircraft Officer.

•DATE: 23 August 1944

23 August 1944

AAA WEEKLY INTELLIGENCE REPORT NO 3

Period:
1106000B to 1806000B

1. Summary of Activity

a. During the week, the enemy continued air attacks against lines of communication, though on a scale reduced from last week's efforts. Bridges and road nets at ALENCON, REMNES and LE MANS received scattered raids, as did other such targets. No damage to protected targets has been reported. The latter part of the week, the GAF switched objectives and struck at forward areas. Field Artillery and armored columns were repeatedly subjected to sudden daylight attacks, most being reported in the XV Corps area.

b. Antiaircraft Artillery claims 28 Cat I's and 11 Cat II's (corrected totals) for the week, out of 113 raids by 252 enemy aircraft or approximately 15% of E/A reported in the Third US Army zone of action. Corrected totals from 1200B 1 August, to 0600B, 18 August (still incomplete) bring reported totals to:

	RAIDS	NO E/A	CAT I	CAT II
1200B 1 Aug. to 0600B 18 Aug	923	1,685	130	55

Total claims for Cat I's and Cat II's equal more than 13% of all E/A reported over Third US Army.

2. GAF Tactics Notes

a. While the GAF has continued with night attacks against such stationary targets as roads and bridges, daylight attacks as noted are a new development and afford interesting speculation. From start of Third US Army operations to date, approximately 35% of apparent objectives have been bridges.

b. High altitude bombing remains a rarity, and dive-bombing is infrequently reported. Night attacks are made from both low and medium altitudes, while daylight efforts usually are from strafing or low-level heights. From start of operations to date, approximately 35% of attacks have been at low altitudes (0-6000 ft), 30% at medium altitudes (6000 - 15000 ft), and 10% have been strafing attacks.

c. No mass raids have appeared though as many as 28 E/A have been reported, apparently making individual attacks, while 15 Me 109's appeared as a group, but passed without making an attack.

3. Miscellaneous Notes

The 270th and the 999th FA Bns, protected by two batteries of the 146th AAA AW Bn, were attacked by 13 enemy aircraft between 1000 and 1630 on 16 August. It is interesting to note that of these 13 planes, 9 were shot down as certain or probables by Antiaircraft fire. 577 rds of 40mm and 4311 rds of .50 cal ammo were expended. No damage to FA materiel or personnel has been reported.

30 August 1944

AAA WEEKLY INTELLIGENCE REPORT NO 4

Period:
1200B to 2400B

1. Summary of Activity

a. In formation averaging about six planes per raid, the GAF struck heavily at forward targets this week. Though many single-plane attacks were made, multiple-plane attacks were more numerous as the enemy continued increasingly to employ tactics. Further, though unsuccessful, attempts by rocket-firing aircraft were made to destroy bridges over the [illegible], especially near [illegible], and numerous attacks were directed at Ordnance, supply and ammunition columns. In one day (August 22d) 117 E/A attacked targets in the XV Corps area, alone.

b. For the week, Antiaircraft Artillery claims 68 planes destroyed (Category I) and 55 probably destroyed (Category II), totaling 209 out of 2176 E/A reported, or approximately 10%. Recapitulation of claims is as follows:

WEEK	RAIDS	NO E/A	CAT I's	CAT II's
(1806008 to 2406008)	72	420	68	55
TO DATE				
(0112008 to 2406008)	1000	2176	209	94

Recapitulation to 2406008 corrected totals, still incomplete) brings Antiaircraft claims to a total of [illegible] E/A destroyed or probably destroyed out of 2176 E/A, or approximately 14%.

2. GAF Tactics Notes

a. Though small scale, sporadic attacks were made against supply dumps, by far the heaviest raids were made upon field artillery, bridges, and AA light and heavy weapons positions.

b. While some attacks occurred during early morning and late evening hours, no determinable effort was made to attack consistently from out of the sun. Attacks came at all hours and from all directions. Low clouds were used as cover both for the attack and in aid of subsequent evasive action.

c. Reports again tell of enemy planes engaged in mock dogfights to mislead ground troops into believing the enemy was pursued by allied fighters, only to peel off and strafe roads and other targets.

d. By far the greatest number of attacks were from low altitudes, being either rocket or strafing attempts by fast-flying FW 190's, with some bombing reported. Ju 88's and Me 110s were but infrequently encountered.

e. One battalion reported 60-70 E/A overhead within a period of six hours during the daytime and reports of attacks in the neighborhood of 25-30 aircraft were not infrequent.

f. Reconnaissance flights at very high and at low altitudes have been reported.

g. A late report mentions a night tactic wherein one plane came over low, wide open to attract attention, followed by 2 or 3 others who, with cut motors, glided quietly in to comb a tracer source.

h. With objectives undeterminable on 31% of raids overhead, to date targets in the Third US Army zone have been attacked as follows:

Bridges	31%
Dams	1%
Artillery	7%
AA positions	6%
Others	12%
Low altitude	35%
Medium altitude	11%
Strafing	10%
High altitude	4%
Dive-bombing	4%
Others (Fen, unstated, etc)	15%

3. Miscellaneous Notes

a. Employed by XV Corps mainly to protect bridges used by the forces initially crossing the [illegible] northwest of Paris, 23d AAA Group reported this action. To record claims, group posted 4.5 Cat I's and 17 Cat II's--a total of 660 aircraft destroyed or probably destroyed out of 2000 E/A reported by them for the two-day period 25 Aug 0001 - 26 Aug 2400. Largest day of these two was the second when 20 Cat I and 15 Cat II claims were scored. No damage to targets under protection is reported.

b. Two battalions contributed heavily to the score. The 450th AAA AW Bn exceeded its record of the previous week. On 25 August this battalion claimed 14 Cat I's and 6 Cat II's. In one action of note, 25 FW 190's and Mr 109's attempted to strafe and dive-bomb from 1200 ft. Driven off, they lost 12 Cat I's and 5 Cat II's all were unsuccessful in their mission. The battalion suffered 5 casualties for the day.

c. The 111th AAA Gun Bn participated in equal measure, claiming 11 Cat I's and 4 Cat II's for the two-day period. Using both 90mm and .50 cal MF fire against formations of 2 to 30 A/C flying at altitudes of 5000 ft down to tree-top height, all attacks were successfully beaten off. Though gun positions were strafed and bombed, but one casualty was suffered.

DATE: 6 Sep 44

6 September 1944

AAA WEEKLY INTELLIGENCE REPORT NO 5

Period:
2400B to 0106008

1. Summary of Action

a. The Luftwaffe sharply curtailed its air activity for the week, returning to sporadic, single-plane night attacks after last week's heavy daytime activity. Raids were spread over targets at [illegible], ST-MIHIEL, MONTMEDY, ORLEANS, METZ, NANCY, ST DIZIER, PITHIVIERS, TROYES and other localities. Bridges and Field Artillery were most frequent targets, with the city of [illegible] suffering one drawn-out raid by 35 enemy aircraft, during which two large fires were started by incendiaries.

b. For the week, 6 E/A were destroyed and 3 probably destroyed of a total of [illegible] E/A reported in 46 raids. Recapitulation of claims is as follows:

WEEK	RAIDS	NO E/A	CAT I	CAT II
(0600, 25 Aug to 0600, 1 Sep)	46	324	6	3
TO DATE				
(1200, 1 Aug to 0600, 1 Sep)	1089	2352	216	93

The above recapitulation of totals for the 31-day period 1200B, 1 August, to 0600B, 1 September, (corrected totals above still incomplete) shows Antiaircraft Artillery to claim a total of 310 enemy aircraft destroyed or probably destroyed, for an average rate of 10 planes per day.

c. Total ammunition expenditures for the 31 days are as follows:

90mm	40mm	37mm	.50 Cal
18,300	17,401	20,324	1,088,649

This ammunition was expended only while antiaircraft was engaged in its primary mission, and includes no expenditures for checks-fire. Antiaircraft also has been employed, though to a lesser degree, for a ground role, notably in the present series of battles. 90mm and self-propelled units have been employed in this manner, and various bridgeheads of the [illegible] river [illegible] on other occasions. Expenditures of ammunition fired in other than an AA role are as follows:

90mm	40mm	37mm	.50 Cal
358	1,106	2,802	88,537

2. GAF Tactics Notes

a. While some raids this week occurred at dawn and dusk, by far the greater number occurred [illegible] hours of darkness with but a few raids scattered throughout the daytime.

b. Direction of approach was from the East in a majority of cases reported.

c. Low-altitude (0-5,000 ft) attacks were most commonly reported, with a few medium-altitude and low-strafing efforts.

d. A small number of reconnaissance flights were observed, with purpose of flight unknown in many other instances where aircraft merely flew past a position without making any sort of attack.

3. Miscellaneous Notes

a. An item of interest to those participating in the heavy attacks near AVRANCHES the first two weeks of August is reported in a USSTAF publication, "Air Intelligence Summary No 40".

"Among the long range bombers, two items are worthy of note .... The second is the use of Ha-[illegible] glider-bombs... against land targets for the first time. Prisoners from III/KG 100, taken on 4 and 7 August, confirmed that several attempts were made on successive nights with these bombs to destroy an important road bridge south of AVRANCHES. It is indicative of the present state of the GAF bombers force that one of the prisoners reported that no special tactics were ordered for this operation, which was entirely foreign to anything they had ever attempted before. Each crew was left to simply improvise what it thought best as it approached the target."

b. Several appearances of the Ju 52 have been reported, being used apparently to resupply troops trapped in southern France. Both the [illegible]th AAA AW Bn (SP) and the [illegible]th AAA AW Bn (SP) report bringing down a Ju 52 (probably the same plane) on 20 August containing 20 German nurses and 9 airmen, all of whom were made prisoners.

c. The [illegible]d AW Bn (SP) for the period 260600-270600 reports an interesting ground employment. At 2230 hours 5 M-51's and 3 M-16's of D Btry were used to fire into OPs, boats, pill boxes and houses across the river at [illegible]. 8 small boats were sunk in the river with enemy troops aboard, and several houses set afire on the far bank of the river, at a cost of 1 man killed and 2 wounded by enemy snipers.

F. R. CHAMBERLAIN, JR,
Colonel, CAC,
Antiaircraft Officer.

ANNEX NO. 2

EXTRACTS FROM DAILY REPORTS
PERIOD AUGUST 1 TO AUGUST 30, 1944

030030 - 030330 - 217th Gun Battalion defending bridges at T2810 (PONTAUBAULT), main roads in vic, and troop concentrations. Enemy aircraft made three bomb runs over target (bridge) without damaging targets or roads. "Window" dropped, but didn't interfere.

Damage to target - none.
4 Cat I's claimed.

Digitized by Google

0513/40 - 320th AW Bn (SP) - "C" & "D" Btrys - Number of E/A over "C" and 0540/47 "D" Btrys near T365038. "C" Btry engaged Me 109, one of flight of 15 Me 109's and FW 190's which attempted armored column E or Dussey. Range - 1,000 yards. Plane smoked and pilot parachuted to ground where captured by infantry. Plane seen to crash. M5 and M49 sights used from M15 and M16 half-tracks.

1 Cat I claimed by "C" Btry.

0513/0 - 119th Gun Bn - 12 raids overhead, altitudes ranging from 200 ft 0540/2 to 7,000 ft. Most flights: around 3,000 ft. "D" Btry reported strafing attack on field H of their position at 2000 hrs. Me 109's, Ju 88's and FW 190's recognized. Largest raid composed of 15 Me 109's. Other attacks composed of 1 or 2 A/C. Most attacks came from W, with others around the compass. In 4 instances, evasive action taken. "Flinder" scattered extensively at approx 0030 hrs. AAAIS inoperative.

2 Cat I's, 4 Cat II's and 1 Cat III claimed.

0523/0 - 467th AW Bn (SP) - "C" & "D" Btrys - defending bridges and sup-0540/0 ply routes near PONTORSON and PONTAUBAULT. On first attack, approx 5 E/A came from S, circled to North at 4,000 ft, and attacked from NE to SW, going down to 200 ft to strafe. Later attacks - strafing, with one DB attack disrupted by "D" Btry. DB attack started at 4,000 ft, 40 deg angle of dive, continued down to 200 ft to strafe. Bomb release alt unknown. "C" Btry claims one Cat I, results of .50 cal and 37mm fire. E/A seen to hit at approx T168017.

1 Cat I claimed.

0411/0 - 320th AW Bn (SP) - 24 plat, Btry A, protecting main route thru 0501/0 SARTILLY. Seven or eight Ju 88's and He 111's strafed and dropped anti-personnel bombs, LL atk, speed 300 to 400 mph.

Btry C, protecting dam at T365038. Single planes came in from all directions, alt from 700 to 1800 ft. Only enemy activity was dropping of flares.

Btry D, protecting dam at T365038. 1 FW 190 strafed and 1 Do 217 strafed and bombed, alt approx 1000 ft. Several other low flying A/C over area.

355rds 37mm and 17,644 rds .50 Cal ammo expended.
Damage to target: None.
Category of Claims: 1 Cat I claimed - 1 Cat II claimed.

0422/0 - 119th Gun Bn - Considerable enemy air activity, consisting of 0502/0 both single plane raids and multi-plane raids. Bombing appeared to be primary mission of enemy. Presumably primary targets for enemy bombs were dam at Coord T367040 and bridge in ST HILAIRE.

Damage to target: None.
Category of Claims: 3 Cat I's claimed - 2 Cat II's claimed.

050950 - 473d AW Bn (SP) - protecting bridges and routes via REGNIES, 050109 Unidentified E/A attacked using DB tactics; planes painted with invasion stripes. 389 rds 37mm and 12,650 rds .50 cal ammo expended.

Damage to target: Reported no serious damage.
Category of Claims: 1 Cat I claimed - 1 Cat II claimed.

051730 - 119th Gun Bn - protecting 2 dams on LA SELUNE River. 23 raids 060226 by E/A between hours stated - fighters strafed nearby positions and roads in a flight of about 10 planes; 10 to 15 bombers flying at alt of about 6000 ft; single raiders. Bombers apparently had as their objective the town of ST HILAIRE and road junctions. 125 rds 90mm and 783 rds .50 cal ammo expended.

Category of Claims: 1 Cat I claimed - 3 Cat II claimed.

051725 - 320th AW Bn (SP) - Btrys A & B protecting river crossings at ST 060030 HILAIRE DU HARCOUET, main routes thru SARTILLY, and river crossings at ST JAMES, seven Me 109's and 1 FW 190 strafed convoy on hwy, alt 100 ft, speed 350 mph, level flight. 1 E/A engaged, alt 2000 ft, speed 200 mph. 1 FW 190 strafed gun section, alt 1000 ft, atk from S, speed 300 mph. 119 rds 37mm and 728 rds .50 cal ammo expended.

Damage to target: None
Category of Claims: None.

051730 - 465th AW Bn (SP) - protecting bridges and supply routes at 051800 PONTORSON and PONTAUBAULT and dam at DUCEY. Btry D was dive bombed and strafed by 3 FW 190's. On return from 1 dive bombing run made at approx alt of 200 ft E/A were pursued by 1 P47 at approx 500 ft alt. Btry continued to fire. Between 0023 and 0215 single bomber attempted to get to defended area but claimed driven off by heavy AA fire.

Category of Claims: 1 Cat II claimed.

061200 - Enemy activity consisted of 75 raids between hrs 060395-070217 071800 reported by all gun Btrys of 119th AAA Gun Bn consisting mostly of single planes each. Only 3 raids consisted of more than one plane. Target apparently town of ST HILAIRE, which was badly damaged. While more raids were reported during this period than any other, multi-plane raids were fewer, and all raids were characterized by a lack of bombing runs and violent evasive action (119th AAA Gun Bn).

062230 - 217th Gun Bn (M) - protecting bridges, roadways and troop con-070548 centration areas. Numerous bombing raids made via this battalion. Enemy normal approach from E, alt ranging from 800 to 6800 yds. It is believed that the targets were bridges at coordinates T281102 and T150040. Main roads in vic and troop concentration areas also included.

Damage to target: None.
Category of Claims: 4 Cat I's claimed - 2 Cat II's claimed.

072200 - 550th AW Bn - protecting defiles and roads vic AVRANCHES. Enemy 080300 sent medium bombers over area with very evident intention of destroying all bridges in the AVRANCHES area - raided area at least 40 times, coming from all directions but predominately N to S and S to E, at alts ranging from 500 to 2000 ft, composed usually of groups of 10 planes. Strafing atks carried out. 524 rds 40mm and 9565 rds .50 cal ammo expended.

Damage to target: Damage, though not vital, was caused. 2 bombs, probable 500 KG's each landed near Btry position resulting in the neutralization of 40mm gun and 10 men of crew (all evacuated, at least 6 being stretcher cases). Two - 1½ ton trucks loaded with reserve ammo destroyed. Bridge was not hit but craters were created just N of bridge on road.

Category of Claims: 1 Cat I claimed - 5 Cat II's claimed.

072315 - 465th AW Bn (SP) - raids started at 072315 and ended at 080830. 080830 Most bombing done from Med and HA except vic of DUCEY which was atkd by dive-bombers as well as Med and HA bombing, 1 low-level bombing atk at PONTORSON - both anti-personnel and HE used.

Damage to target: Several near bomb misses at both DUCEY and PONTORSON.

Category of Claims: 5 Cat I's claimed.

081200 - Encountered radar interference between 100 mils and 400 mils, 091200 elevation at an azimuth of 6400 mils and between 0 and 20000 yds range. Echoes from this interference were not as pronounced as those from window. Echoes appeared at 0045B and disappeared slowly until 0115B. A target picked up beyond 20000 yds could be tracked through this interference but target echo could not be distinguished when encountered first at less than 20000 yds, (119th Gun Bn). Enemy activity consisted mainly of bombing with anti-personnel bombs and strafing of roads and positions - heavies. It was noted that E/A are not using tracer ammunition when strafing, (465th AW Bn (SP)).

082248 - 217th Gun Bn (M) - protecting bridges, roadways and troop con-090336 centration areas. Approx 50 E/A involved in numerous bombing and strafing raids in area, approach normally from E, speed, alt and direction changed constantly before and after dropping bombs. 567 rds 90mm ammo expended.

Damage to target: Btry A received direct hit from an anti-personnel bomb at 2340 causing minor damage - 5 EM wounded (4 minor, 1 probably to be evacuated).

Category of Claims: 2 Cat I's claimed - 1 Cat II claimed.

DECLASSIFIED

[illegible] - 473d AW Bn (SP) - protecting bridges at REGNIE. A single E/A [illegible] to bomb targets at REGNIE from E, but was shot down [illegible] of city. M16's fired at target using a [illegible] sight.

Category of Claims: 1 Cat I.

091200 - One apparent tactical move of enemy aircraft at night is to 101200 have one plane circle the objective projecting a light smoke. The trailing planes then dropped flares in area designated by smoke. (320th AW Bn (SP)).

100600 - Enemy patrols active in vic of our installations. 537th Bn 110600 captured 61 prisoners and killed one enemy. 387th Bn took 13 PW's; 320th Bn took 18 PW's; 456th Bn captured 3 PW's; 128th Bn captured 20 PW's. (234 Group).

121800 - 537th AW Bn - Btry C, protecting bridges in ALENCON: Btry D, 130005 supporting 344th FA Bn. Btry D engaged 35 Me 109's vic (3598L7) at approx 1800 hrs, approached from high alt from W - turned N and circled to E and left. Btry C engaged 9 FW 190's circling positions vic (3535BL) at 1840 hrs, At 0001 hrs enemy bombed ALENCON after dropping flares. Planes were engaged.

Damage to target: None.

Category of Claims: 1 Cat II (at 0005).

132052 - 320th AW Bn (SP) - Btry B, assigned AA defense of bridges at 132053 LE MALE (B4060). Gun He 211 engaged 1 Me 109 during strafing atk toward town, flying E to W using hedge-hopping tactics, alt 200 ft, speed 250 mph. Hits secured on tail of plane, causing it to reverse direction and leave area. No special target atkd, apparently trying to disrupt communications on main hwy leading into town.

Damage to target: None.

Category of Claims: None.

140830 - 551st AW Bn (M) - Btry A, furnishing protection for 2d4th FA 000000 Bn. Three FW 190's strafed and bombed Btry vic SCHAUPAL shot down by Btry A with M51's. Observed going down in smoke by FA.

Damage to target: None.

Category of Claims: 1 Cat I claimed.

160600 - 463d AW Bn - furnishing protection for 79th Div Arty. Seven 170600 Me 109's strafed column on road in ORMOY and installations of Hq 79th Inf Div. A/C approached from E flying at about 25 ft alt. After strafing vehicles in ORMOY, three planes flew off and were not seen again. The four remaining split into two pairs and flew one pair on either side of the woods, strafing trucks dispersed in open fields. Planes were engaged with 40 mm and .50 cal fire, and one plane was hit by 40mm. Pilot landed plane in nearby field, and was captured by personnel of the 456th AAA AW Bn. 106 rds 40mm and 1230 rds .50 cal ammo expended.

Category of Claims: 1 Cat I claimed.

161000 - 466th AW Bn (M) - Btrys B & D, protecting 270th and 999th FA Bns 161630 respectively. At approx 161000 5 Me 109's approached from N at alt of 300-1000 ft and strafed ground troops, taking constant evasive action, and disappearing towards the E. Planes were engaged by 40mm fire with Stiffkey Stick and .50 cal M51's with 40m-9.

Category of Claims: 2 Cat I's claimed - 1 Cat II claimed.

Btry D, protecting 999th FA Bn. At 1630 2 Me 109's flew at 100 - 150 ft - N to S - directly over Btry area at speed of 350 mph, strafing indiscriminately, no evasive action employed. Engaged by 40mm fire. Lead plane engaged by M51's and hits (for Cat II) claimed.

No damage reported to personnel.

Category of Claims: 1 Cat I claimed - 1 Cat II claimed.

170600 - 398th AW Bn (SP) - furnishing protection to elements of XV [illegible] - Seven flights of E/A, Me 109's and FW 190's [illegible] sections. All available AA weapons opened fire. [illegible] 00 rds .50 cal ammo expended.

DECLASSIFIED

AAA

Digitized by Google

Bty B reports slight damage to equipment.

Category of Claims: 3 Cat I's claimed - 1 Cat II claimed.

171600 - 171801 — 44.8th AW Bn - protecting XII Corps Arty. One Ju 52 came in at 900-1000 ft from S and W of [illegible]. (It is believed it intended to land at airfield 8634.35, not knowing Americans were in the vic). As K/A got in range guns unable to fire freely due to the danger angle of 10 degrees, or plane was out of sight below hill -- one or the other. 11 rds 40mm and 55 rds .50 cal fired, following which K/A took evasive action and departed to the E.

Damage to target: None.

Category of Claims: None.

190840 - 191830 — 111th Gun Bn - protecting SEINE R crossing (bridge). Two flights of K/A FW 190's and Me 109's (11 at 0840 - 0845 and approx 20 at 1825 - 1830) flew over area approaching from NE at alt of 1100 - 2000 yds. Planes took violent evasive action when engaged - seem fire methods for 90mm. 91 rds 90mm and 7780 rds .50 cal ammo expended.

Category of Claims: 2 Cat I's claimed.

191835 - 000000 — 467th AW Bn - protecting XX Corps Arty. Flight of 15 K/A, Me 109's and FW 190's, swept over bivouac area at 6000 - 8000 ft, 5 of which dived to atk liaison plane but were driven off by AA fire. Heavy firing was done at extreme range.

Category of Claims: 3 Cat I's claimed.

211100 - 211950 — 44th AW Bn - employed with 79th Div Arty. Air activity was very heavy over the area near the bridge over the SEINE R (8546690). All K/A which approached (general approach from N and E) were fighters, Me 109's and FW 190's, Me 109's being in majority - and were in groups of 2 to 6 planes each. Alt before clouds lifted at 1400 was from 2½ to 700 ft - later 2000-5000 ft. Ac atks were pressed home in a determined fashion - K/A taking full advantage of cloud cover at first signs of AA fire. 1538 rds 40mm and 23171 rds .50 cal ammo expended.

Damage to target: None.

Category of Claims: 11 Cat I's claimed - 3 Cat II's claimed.

210800 - 221955 — 44th AW Bn - protecting 79th Div Arty. Air activity was again very heavy vic bridge over the SEINE R (8546690) and bridgehead across the R. K/A approached area in large flights, Me 109's and FW 190's with Me 109's in the majority, but broke up into units of from 3 to 8 and atkd from many directions. Atks in general were carried out from alts of about 1000 ft although some A/C came down to minimum alt, forcing some guns to hold fire rather than fire on friendly troops. There were seven raids, as such, and many individual engagements - engaged with 40mm (8B) and .50 cal M51 (IFC) fire. Direction of approach in each case was from the N or NE.

Attacks were frequent, with planes strafing AA gun positions at times and Bazooka were fired at bridge across the SEINE and in at least one case at 40mm gun position.

In one case several K/A flew figure 8's at medium alt, while three others made a very low alt strafing run at bridge - apparently designed to distract AA guns from atking planes.

Damage to target: 1 BM killed, 5 wounded by strafing planes - no material damage.

Category of Claims: 7 Cat I's claimed - 1 Cat II claimed - 1 Cat III claimed.

220803 - 230830 — 441th Gun Bn - protecting SEINE R crossing (bridge). Enemy raids consisted of were planes per raid than heretofore encountered. Formation at approach to area generally 4 to 6 planes staggered line abreast. Formations of from 2 to 30 planes, general approach from the E, scattered to atk from all directions - strafing and rocket-firing - from tree-top to 7000 ft alts, at high speeds of from 300 to 400 mph. To avoid AA fire, K/A dived out of sun, took weaving action, and went into shallow dives. Window was dropped extensively but no difficulty was experienced in tracking.

Damage to target: Bty B strafed - 1 casualty. AP bomb fell in Bty B position - damaged M-4 tractor.

Category of Claims: 11 Cat I's claimed - 2 Cat II's claimed.

Ammo expended: 279 rds 90mm and 18954 rds .50 cal (NOTE): (all above claims for .50 cal MG).

221148 - 221515 — 387th AW Bn (SP) - protecting CT's, 5th Armd Div. At 1148 Bty C observed and engaged 4 Me 109's flying low at 400 ft. At 1316 Bty C fired 10 rds 37mm ammo on 2 P-51's at 600 yds. (No damage) - At 1515 Bty B vic ST VINCENT les BOIS at (R3977130) observed and engaged 7 FW 190's flying at 800 - 2000 ft E strafing the 400th FA and 71st.

Damage: 1 of Bty B's trucks damaged. 10 personnel casualties.

Category of Claims: 1 Cat I claimed. 3 Cat II's claimed.

230730 - 232001 — 44th AW Bn - protecting 79th Div Arty. Air activity was less intense during period as friendly fighters were in vic most of the day. Enemy A/C which did operate over the area were still attempting to knock out the bridge over the SEINE (5166630) and 2 K/A strafed AA gun positions. Flights composed of 2 FW 190's, 12 Me 109's and 20 FW 190's, approaching from all directions at alts ranging from 150 ft to 7000 ft. Two P-47's over area at 2000 - 2001 -- 1 reported to have fired rockets at bridge over the SEINE and to have strafed AA positions -- fire was broken off upon identification of the plane type.

Category of Claims: 3 Cat I's claimed.

231410 - 000000 — 489th AW Bn (SP) - protecting CT's and Trains, 4th Armd Div. Flight of approx 20 K/A at alt of 200 ft engaged by Bty B, 1 mi E of SALIGNY. A/C were identified as FW 190's and at least 1 Ju 87 (Stuka). 92 rds 37mm and 3535 rds .50 cal ammo expended.

Damage to target: None reported.

Category of Claims: 7 Cat I's claimed.

231430 - 231445 — 452d AW Bn (M) - 1st Plat, Bty C, providing protection for 191st FA Bn. 15 K/A, believed to be Me 109's with 2 FW 190's, approached from various directions and approx 500-1000 ft alt. Speed of atk approx 390 mph. Evasive action was taken. All gun sets of 1st Plat Bty C opened fire with both 40mm using SS and .50 cal multiple gun using M-9 sight. Target of K/A was evidently the 191st FA Bn. 55 rds 40mm and 2130 rds .50 cal ammo expended.

Damage to target: None.

Category of Claims: 2 Cat I's, 2 Cat II's and 2 Cat III's.

252310 - 260256 — 119th Gun Bn (M) - employed for defense of SEINE, many planes (approx 35) were fired upon in 29 engagements. K/A in single formation - at alts from 600 to 10,000 ft (avg 6000 ft), avg speed 250 mph, general approach from E and NE. Raiders flew on straight course until flak was encountered at which time in most instances evasive action was violent -planes circling out of range and zig - zagging. 90mm firing with M-9 Director and SCR-584 and .50 cal with ITC. 282 rds 90mm and 300 rds .50 cal ammo expended.

Damage to target: Two large fires started in town of SEINE by incendiary sticks - extent of damage unknown.

Category of Claims: 2 Cat I's claimed.

260655 - 000000 — 452d AW Bn (M) - Bty A, (less 2d Plat), protecting 179th FA Bn. At time stated 1 Ju 52 flying S to N at about 300 ft alt was engaged by M51 of Bty A. The plane opened fire on the M51 immediately after it went into action. 360 rds .50 cal ammo expended.

Damage to target: None.

Category of Claims: 1 Cat I claimed.

(NOTE: Plane crashed at Y180550). Prisoners captured, 9 German airmen, 19 German marines. Gunner Killed).

261730 - 000000 — 203d AW Bn (SP) - protecting 79th Armd Div. Two Me 210's approaching at a terrific rate of speed from the N dived from alt of 10,000 ft to 4,000 ft and dropped anti-personnel bombs which exploded before hitting ground.

Damage to target: None.

Category of Claims: None.

262311 - 262330 — 126th Gun Bn (M) with Bty D, 390th AW (SP) Bn attchd - protecting bridges across SEINE R, vic FONTAINEBLEAU. Approx 30 K/A approached area from Easterly direction heading N. Planes began circling and dropping photographic flares - flares falling in at least 7 different groups. Alt of A/C ranged from 800 to 7500 ft. Heavy flak employed prevented any bombing run over bridges. Two small fires seen burning approx 6 miles N of protected bridges - bombs believed to have been dropped in that area. 65 rds 90mm, 13 rds 37mm and 1600 rds .50 cal ammo expended.

Damage to target: None.

Category of Claims: 1 Cat II claimed.

291630 - 000000 — 452d AW Bn (M) - protecting FA, five Me 109's approached from N and circled Arty concentration vic CHALONS (T6284165). After circling K/A split, 4 to the left and 1 to the right, and made strafing atk. 26 rds 40mm and 200 rds .50 cal ammo expended.

Damage to target: None.

Category of Claims: None.

AAA WEEKLY INTELLIGENCE REPORT NO 6

Period:
0106GB to 0806GB

1. Summary of Action

a. Air activity this week continued at a lower rate than that of which the enemy is believed capable. Greatest number of planes reported in one day was 66 K/A for the period 1 - 2 September. A few daylight raids were reported during mid-afternoon hours against such targets as armored columns and field artillery. By far the greatest number of raids occurred at night, however, with bridges and road nets the apparent objectives. Targets in VERDUN, CHARNY, COMMERCY, and VITRY - LE-FRANCOIS received most attention, with REIMS, EPERNAY and other cities receiving scattered raids. Three squadrons of K/A strafed and fired rockets at field artillery during one daylight raid, and 35 dive-bombing, strafing and rocket-firing K/A attacked elements of CCA of the 4th Armored Division in another. Some personnel casualties resulted, at a cost to the GAF of a considerable number of planes and pilots. Bridges and other targets protected by antiaircraft units were undamaged.

b. For the week 25 K/A were destroyed and 7 probably destroyed of a total of 150 reported. Better than 83% of all K/A reported were claimed as casualties to antiaircraft fire. Recapitulation of claims (corrected, still incomplete) is as follows:

	Raids	No K/A	Cat I	Cat II
Week (0600, 1 Sep, to 0600, 8 Sep)	36	150	85	7
To Date (1200, 1 Aug, to 0600, 8 Sep)	1185	2303	218	100

Digitized by Google

DECLASSIFIED

2. GAF Tactics Notes

a. Most attacks were at night between the [illegible] Small numbers of A/A were used in these raids and ... by followed quickly upon engagement by AA.

b. Daylight raids involved larger formations and more violent attacks, featuring strafing, dive-bombing and rocket-firing, with several attacks made directly against AA positions.

c. Most bombing attacks were from low altitudes, with medium altitude and low-level strafing attacks next in order.

d. Since many attacks were driven off before delivered, it cannot be determined what specific targets in cities had been selected. Bridges and other traffic bottlenecks may be assumed as probable targets, with warehouses a suggested possibility.

3. Miscellaneous Notes

a. A late report from the 148th AAA AW Bn gives interesting detail on GAF rocket-firing technique. Two rockets are always projected at the same time, leaving the A/C in a tremendous volume of flame that extends 3/4ths the length of the fuselage. They usually are projected from an altitude of 500 - 1,000 ft, at an angle of dive of 45 deg's, with little or no smoke or flame following the rocket from the A/C to the target.

b. The 492nd AAA Gun Bn, defending bridges at VERNON and CHARNY, engaged 8 R/A on 3 September, between 2240 and 2300 hours. The aircraft approached from different directions at an average altitude of 5,000 ft, with one low-flying attack at 1,000 ft. Firing was entirely unaccom with 90mm guns, using the radar SCR-584 and the M-9 Director, except for the low-altitude attack which was engaged by .50 cal machine gun fire. 270 rds of 90mm and 521 rds of .50 cal ammo were expended, with a claimed result of 4 Cat I's and 1 Cat II, or 5 planes downed out of 8.

c. Protecting CCA of the 14th Arm'd Div, the 489th AAA AW Bn (SP)("Murphy's Marauders") engaged 15 R/A which came low to fire rockets, strafe and dive-bomb elements of the command. Of these 15, 6 are claimed as Cat I's. Expenditure of 382 rds of 37mm, 8295 rds of .50 cal and 250 rds of .30 cal ammo is reported.

d. Reports indicate frequent instances this week of personnel casualties and material damage resulting to AA units employed close to the non-firing front lines. Hostile artillery and mortar fire against AA positions must be expected to continue so long as the present situation continues, particularly when employment as field artillery risks attraction of counter-battery fire.

e. The 38th AAA Brigade and units attached for the period 1 August to 10 August and engaged in the defence of the vital supply route from COUTANCES south to AVRANCHES have been officially commended in General Orders No 53, this Headquarters, for their outstanding performance of duty.

AAA WEEKLY INTELLIGENCE REPORT NO 7

Period:
0806000 to 1506000

1. Summary of Action

a. But little enemy air activity was reported over Third US Army zone this week. 19 R/A was the greatest number reported in any one day as bad weather, plus heavy losses, hampered the GAF. Most flights were at low altitudes, and apparently were reconnaissance flights as few attacks on ground targets were made. Immediate evasive action usually followed any engagement by antiaircraft. Most R/A were reported by AA units located in forward zones, with activity also reported over COMBERET, VIENT-LE-FRANCOIS, TOUL, PONT-A-MOUSSON and CHALONS.

b. 1 Cat I and 6 Cat II's out of 45 R/A constitute this week's claims. Recapitulation of claims (corrected, still incomplete) is as follows:

	Raids	No. R/A	Cat I	Cat II
Week (0600, 8 Sep, to 0600, 15 Sep)	16	45	1	6
To Date (1800, 1 Aug, to 0600, 15 Sep)	103	348	295	135

2. GAF Tactics Notes

a. Most R/A appeared during darkness, 26 raids being reported between 2130 - 0315 hours, as against 16 during daylight.

b. Low-level appearances accounted for 30 of the 42 raids reported, 7 of these being strafing attacks. Low cloud formations may have dictated the tactics reported.

c. Clouds frequently were used to mask approaches and evasion of AA fire.

d. This week, the only targets definitely known to be attacked (and these but two or three times) were antiaircraft and field artillery gun positions, with other targets being hidden from view of the reporting units by trees and hills. To date, of these targets still being attacked, percentages are as follows:

bridges	39%
field artillery positions	6%
antiaircraft positions	6%
cities	14%

Other targets have been attacked, sometimes in considerable strength as in last week's attacks on armored columns, but such are infrequently chosen.

e. To date, figures for altitudes and types of attacks are as follows:

low-altitude bombing (and rocket-firing)	37%
medium-altitude bombing	8%
strafing	15%
high-altitude bombing	9%
dive-bombing	9%
reconnaissance & unrated	14%

3. Miscellaneous Notes

a. Personnel casualties and material damage continue to be reported by antiaircraft units in forward areas, with both guns and automatic weapons occasionally being used in ground-fire roles.

b. With the historic, space-eating sweep of the Third US Army slowed by heavy enemy resistance and with the front narrowed, AAA/D systems are beginning to function on an Army and Corps, rather than a unit, basis. The 38th AAA Group, under 38th AAA Brigade, has established an AAA/D using plots from the 1st Air Defense Wing, radars and visual OPs and the 23d AAA Group (XV Corps) has set up near CHARTRES an AAA/D of a similar type, first established so successfully by them at the MANTES-GASSICOURT bridgehead over the SEINE River.

c. Attached is a tabulation of claims, showing total number of formal claims submitted, and total approved claims. Apparent discrepancies in claims and claims-granted figures arise when a claim is denied, but allowed as a lesser or as a higher category than claimed.

d. Holders of greatest numbers of approved claims are listed below:

		Cat I	Cat II
(1)	Guns - 413th AAA Gun Bn (M)	2½	½
(2)	AW - 456th AAA AW Bn (M)	2½	11
(3)	SP - 489th AAA AW Bn (SP)	1½	0

e. Most accurate shooting score hung up (counting both Cat I and II claims) is by the 489th AAA AW Bn (SP) which was granted 19½ Cat I's out of a total of 52 airplanes engaged, for approximately 36% accuracy.

AAA WEEKLY INTELLIGENCE REPORT NO 8

Period:
1506000 to 2206000

1. Summary of Action

a. With ground activity on other fronts now demanding its attention, and bad flying weather hampering its activities locally, the GAF sent but 20 reported aircraft over Third US Army zone this week for the lightest air effort reported since operations began. Only two attacks were made, one against the MOSELLE River bridge at CHARNES, and one against a Cub observation plane in the same vicinity. Flying for the most part at medium and low altitudes, other flights apparently were information-gathering in character, and were reported over VIENT-LE-FRANCOIS, CHALONS, COMMERCY and TOUL, as well as over divisional artillery units.

b. Two Category I's are claimed this week, with no Category II's reported. Recapitulation of claims (corrected, still incomplete) is as follows:

	Raids	No R/A	Cat I	Cat II
Week (0600, 15 Sep to 0600, 22 Sep)	13	20	2	0

2. GAF Tactics Notes

a. No noteworthy tactics or trends appeared in this week's meagre air activity. E/A came in at moderate altitudes, often being seen only momentarily thru rifts in the clouds. Those fired upon took ordinary evasive measures and usually continued on their course.

b. This week marked the first instance (reported by AA units) of enemy fighters attacking Cub-type A/C. The plane shot down apparently had been observing for a division artillery unit.

3. Miscellaneous Notes

a. Attacks this week by P-47s, which continued despite display of correct panels, smoke and flares by ground units, strengthen the possibility that the enemy is using captured aircraft of American manufacture.

b. The GAF is still capable of a considerable air effort. For the week, 7R raids by 151 E/A were reported by First US Army, with 47 plus being the greatest number in any one period. Latest figures obtained from the XIX TAC show the following A/C available to the German Air Force:

NW Germany	220 SEP	110 TRP
SW Germany	470 SEP	280 TRP
TOTALS -	690	390

Of these single and twin-engined fighter aircraft, approximately 550 are available for use against the Third US Army zone, with maintenance requirements making 66% of these flyable at any given time. Each airplane could fly 2 sorties per day. Current tactics suggest their appearance in flights of 30-40 A/C when used defensively, with ground attacks following recent trends.

c. Two jet-propelled E/A were observed via STE GENEVIEVE on 16 September, travelling at an estimated speed of 450-500 mph. Another report from outside sources notes an E/A travelling too fast to be engaged by radar.

d. Attempted radar jamming of a new type has been reported by the 128th AAA Gun Bn. In a report dated 22 September, it is said:

"1. On 19 September 1944, at approximately 1845, there was observed an apparent attempt at radar jamming, at two different sets of this battalion. On the 32000 yard scope there appeared a five starred figure, constantly rotating about the scope. These traces were also evident on the FPI scope. Changes in azimuth did not have any effect on the picture. The traces continued for approximately 30 minutes and then disappeared on both sets. The same phenomenon was again observed the following day.

"2. On 20 September 1944, at approximately 1545, there was observed radar interference at "A" Battery radar of this battalion. There was a moving trace, similar to what a formation of from six to ten planes, would make, that continued to move along the sweep of both the 32000 yard and FPI scopes. The echoes would come from more than 100,000 yards and continue inward to 0 range. The repetition frequency was different for the two crystals. On crystal #1, the trace moved clockwise, at a repetition rate of approximately 12 seconds. On crystal #2, the trace moved counter-clockwise at a repetition rate of approximately 22 seconds. The trace did cause the set to lose a target. As the trace passed through a target being tracked in automatic, the set lost the target. The intensity of the trace was dependent on azimuth, that is the trace would slowly disappear as the azimuth was changed, but the trace would come in strong on several different azimuths, in all polar directions. All signs of the trace disappeared at 1615."

AAA WEEKLY INTELLIGENCE REPORT NO 9

Period:
220600A to 290600A

1. Summary of Action

a. Hostile air activity over the Third US Army zone continued at a low scale this week. Only four actual attacks were made against ground targets, with an additional attack on two artillery observation planes in the air. Total E/A attacking were 10, of which 4 were claimed as destroyed or probably destroyed. Other E/A reported apparently were engaged on low-level reconnaissance missions, as no attacks were made. The majority of E/A were reported over bridges, artillery and armored elements in forward zones, with others over COMMERCY, NANCY and CHARMES. Automatic weapons units claimed all Categories, as E/A made most appearances by daylight, usually around 0930 and 1330 hours.

b. A total of four Categories are claimed. Corrected recapitulation of claims is as follows:

	Raids	No E/A	Cat I	Cat II
Week (0600, 22 Sep to 0600, 29 Sep)	20	49	2	2
To Date (2200, 1 Aug to 0600, 29 Sep)	1236	3475	299	137

Total of Categories claimed is 436, or approximately 13% of all enemy aircraft reported over Third US Army zone. This figure does not include those known to be merely damaged, of which there are many.

2. GAF Tactics Notes

a. Most E/A were observed at low altitude (0 - 6,000 ft), as clouds apparently made higher reconnaissance flights impossible.

b. When engaged by AAA fire, enemy pilots repeated last week's tactical reaction and took evasive measures, continuing on course rather than turning to attack AAA sites or defended areas. Rapid climbs and dives until out of gun range appeared to be the tactic generally employed.

3. Miscellaneous Notes

a. Gun section No. 8 of Battery A, 1824 AAA AW Bn, used but 4 rds of 40mm fire to get a direct hit on the cockpit of a Me 109 and bring it down, in a very economical piece of shooting.

b. Observation planes of the 80th Inf Div took full advantage of the safety-zone established by the 693d AAA AW Bn over the division artillery and, when pursued by two Me 109s, lured them into it with the result that one was knocked down and the other driven off. The observation planes were unmanaged by the attack.

c. Late reports received from the 777th AAA AW Bn (SP) place them at the top of the list for accuracy, displacing the 489th AAA AW Bn (SP), prior record holder. The 777th was awarded 16 Oct I's and 1 Oct II, or 17 planes damaged or destroyed out of 41 engaged for a percentage of 38.6%, bettering the mark of 37.5% established by the 489th.

d. AAA IR systems are now generally working smoothly throughout the entire Third US Army area, with six minute prior warnings being not uncommon. Considerable interference with radio reception is still encountered though wire circuits have, in many cases, overcome this difficulty.

e. With enemy air activity lately at a minimum, AAA gun battalions are occasionally called upon to fire field artillery missions, with some excellent results observed. Taking advantage of the high muzzle velocity of the 90mm gun, harassing and interdiction fires form the usual missions.

f. Yet another type of radar interference has been reported by the 128th AAA Gun Bn, which last week reported a five-starred figure which rotated about the scopes. In a special report dated 24 September, it is said:

"2. The interference is in the form of a moving pulse, appearing to be similar to what a flight of eight to ten planes would resemble. The pulse moves inward and outward from maximum range to minimum range, at a repetition frequency and direction that depends upon the crystal used. The repetition frequency varies from 12 to 22 seconds.

"3. The main source of interference appears at an azimuth of 1200 mils. Interference is also received, in lesser degrees, from other azimuths. However, the interference is dependent upon the azimuth positions of the parabola, and disappears entirely throughout most of the circle. The interference is also dependent upon elevation and disappears completely at 200 mils."

AAA WEEKLY INTELLIGENCE REPORT NO 10

Period:
290600A to 060600A

1. Summary of Action

a. Efforts of the German Air Force persisted at a modest scale this week as but 22 raids were reported, 8 of which developed into actual attacks on ground targets. The remainder were presumably reconnaissance missions, made under cover of darkness as in the past. Two attacks comprised an effort to bomb an ammunition train and antiaircraft units protecting it south of COMMERCY. Other flights, mainly low-level, were reported over TOUL and DOMREMAIN as well as over MOSELLE River bridges and front line targets. No damage to any protected areas was reported.

b. Tally of claims to date is as follows:

	Raids	No E/A	Cat I	Cat II
Week (0600, 29 Sep to 0600, 6 Oct)	22	31	0	4
To date (2200, 1 Aug to 0600, 6 Oct)	1258	3506	299	141

2. GAF Tactics Notes

No new tactics were noted during the week.

3. Miscellaneous Notes

a. The 489th AAA AW Bn states that, in its area, daylight appearances by enemy aircraft usually presage an attack at night.

b. Attached is a daily tabulation of claims for the month of September. Also attached is a corrected tabulation for August, made necessary by receipt of corrected figures from some units and of numerous late claims from widely dispersed units of VIII Corps.

c. Extract of G-2 Periodic Report No. 134, Headquarters Third US Army, 050600 Oct, reads as follows:

"(1) AIR -

(a) Estimate of GAF Fighter Planes and activity in the West (prepared by A-2, XIX Tactical Air Command): During the whole month of Aug and the first part of Sep, GAF fighter activity in the Third US Army zone continued to decline. This reduction in operations was undoubtedly due to a combination of the following factors:

1. Losses incurred as a result of counter air force operations.
2. Withdrawal from bases in FRANCE to airfields within GERMANY.
3. The subsequent organization difficulties involved in establishing new A/F and adequate supply and maintenance facilities.
4. The reported fuel shortage.

Through the same period, GAF 1/R number activity was also at low ebb. It is believed this lack of number activity was mainly due to:

1. Fuel shortage, priority undoubtedly being given to fighter E/A.

Digitized by Google

2. The diversion of personnel, equipment and supplies to fighter effort.

It is believed that early [illegible] battle wastage, attacks on enemy airdromes by friendly aircraft has reduced the [illegible] single-engine fighters capable of operating against the ALLIES in the WEST to approximately 1450-500. Since the [illegible] apparent that the enemy fighter strength has been increasing. It is estimated that the enemy now has close to 800 single-engine fighters based on airdromes along the Western front available for operations.

This increase in single-engine fighter aircraft is probably due to a variety of reasons:

1. Withdrawal to bases behind the RHINE, which simplifies his repair and maintenance problems.

2. Non-flyable weather, which reduces battle wastage and prevents attacks on his airdromes.

Such periods of inactivity also give the enemy an opportunity to increase the serviceability of his aircraft. How much of this build-up is due to the transfer of other units into this area is not known at present.

In spite of reported fuel shortages, it must be assumed that every effort is being made to bring existing stocks to operational levels.

The enemy's airfield development program has had sufficient time to provide the necessary servicing and repair facilities to effectively support operations.

Although the GAF may not be capable of sustaining intensified operations over the entire front simultaneously, it is capable of employing a considerable force over any sector of the front when the situation calls for such an effort.

Around CAEN, it was possible to maintain constant Allied air patrols which usually succeeded in intercepting enemy a/c before they could reach the battle area. The length of the present front precludes the effective use of air patrols to interdict enemy aircraft.

During the Allied Airborne landings in HOLLAND, the GAF displayed increasing aggressiveness in its efforts to combat these operations.

Fighter-bombers were employed for the first time in several weeks against the airborne landings in the North. Fighter-bombers equipped with rockets have operated only sporadically during the past several weeks.

Most of the recent GAF fighter activity has been in defense of German ground forces against our fighter bombers.

Photo Intelligence reports and observations by our own pilots disclose the presence of both the ME-262 and ME-163 jet-propelled a/c in the XIX TAC and Third US Army zones.

The conclusion indicated is that the enemy fighter force has now largely recovered from the losses incurred in August and early September and is capable of a strong air effort at any selected point on the front for a brief period. An all-out effort, however, will probably be reserved for an attempt to counter a particularly dangerous penetration of Reich territory.

(b) Two P-51's reported to have dark olive drab camouflage on upper surfaces and sky-blue on lower surfaces, but with no Allied or other markings discernible, attacked P-47's of 36th Group (XIX US TAC) at 6,000 feet GE1530h Vic SAARLAUTERN (Q 72) area, damaging one. Hits were scored on one of the P-51's, believed to have been enemy operated."

ANNEX NO. 4

EXTRACTS OF BATTALION
DAILY UNIT REPORTS

SEPTEMBER 1944

310600 - 010600 (Aug-Sep) - 480th AW Bn - Bury B (atchd to 175th Inf Regt to knock out installations on hill 103) fired on emplacements on crest of hill destroying one gun positions and employed harassing fire in general area. 40mm of Sec 16 also fired on, and destroyed, an enemy gun position.

Bury C (atchd to Task Force "S" to knock out strong points along route GC 67) fired on and destroyed enemy pillbox and employed harassing fire on dug-in positions along crest of hill.

Bury D (atchd to Task Force "X" to knock out positions via bridge across canal on route GC 53) fired on enemy troops, AA installations, pillboxes, MG nests, and mortar positions. Damage to enemy: 2 AA positions known to be destroyed and possibly a third. Enemy troops forced to evacuate pillboxes under fire, resulting in heavy losses in personnel. 1 Mortar position probably destroyed.

Damage suffered: Bury B: None. Bury C: 4 casualties (evacuated), no damage to equipment. Bury D: Barrage of mortar and 88mm fire on 2d Plat emplacements resulted in destruction of 3 Hiffley Stick on 40mm, Sec #9; and flash hider of 40mm, Sec 30. No casualties.

010600 - 080600 - 480th AW Bn - Bury B (atchd to 175th Inf Regt to knock out installations on hill 103) fired 9 rds 40mm at haystack and shed, where activity was observed. Both haystack and shed were destroyed. 20 rds 40mm were fired at house being occupied by enemy troops - house was destroyed. 213 rds .50 Cal and 35 rds 40mm ammo were fired at hedge over which the enemy were attacking, inflicting casualties.

Bury C (atchd to Task Force "S" to knock out strong points along route GC 53) fired at 2 pillboxes and 4 houses occupied by the enemy. A prisoner stated several were killed in these houses. Bury also fired harassing fire at an 88mm gun position to keep it from being used. 1 prisoner taken.

Bury D (atchd to Task Force "X" to knock out positions via bridge across canal on route GC 53) fired 19 rds 40mm at a pillbox - no further activity observed around this pillbox. 18 rds 40mm fired at 2 vehicles - sending one off the road.

011305 - 011515 - 482d AW Bn (M) - Protecting PA. 3 Sqdns of Me 109s and FW 190s, approx 18 planes per Sqdn, strafed and fired rockets at PA construction via (U-4558), approached from Easterly direction at alt of 300-500 ft. Planes dispersed upon being engaged. 321 rds 40mm and 1309 rds .50 cal ammo expended.

Damage to target: No damage inflicted on protected PA Bn, however, another PA Bn in near vic suffered 25 casualties.

Category of Claims: 3 Cat Is claimed (no 109s).

012000 - 020000 - 467th AW Bn (SP) - Protecting CCs A & B, 4th Armd Div. Approx 25 E/A (FW 190s and Me 109s) strafed, dive bombed, and fired rockets at elements of CCA, 4th Armd Div near COMMERCY (U-4652-8000). 382 rds 37mm, 2895 rds .50 cal, and 890 rds .30 cal ammo expended.

Damage to target: Elms of CCA suffered casualties of 3 killed and 25 wounded. 3 guns of Bury B, 467th AW Bn (SP) slightly damaged.

Category of Claims: 6 Cat Is claimed.

012251 - 012328 - 120th Gun Bn (M) - Btrys C & D, protecting bridges at VERDUN. Btrys C & D report a total of 13 unidentified E/A engaged on 17 courses (Btry C-8 E/A and Btry D-5 E/A) at avg alt of 2600 yds. E/A on bombing and Ron mission - no strafing reported. Flares and window were dropped. All firing unseen with SCR-584 and M-9 Director. 361 rds 90mm ammo expended.

No damage to bridges.

Category of Claims: 4 Cat Is claimed.
1 Cat II claimed.

012300 - 020030 - 551st AW Bn (M) - Protecting XX Corps Arty and MEUSE R bridges at VERDUN and CHAREY. 6 flights, of 3 E/A each, over Arty CA; and approx 12 E/A bombed bridges at VERDUN and CHAREY. 239 rds 40mm and 3670 rds .50 cal ammo expended.

Damage to target: Near bomb miss at VERDUN - bridges undamaged - fires started in city. 1 casualty suffered in unit protecting Arty - shrapnel in hip and leg. Any further damage unknown.

Category of Claims: 2 Cat Is claimed.
1 Cat II claimed.

022221 - 022258 - 120th Gun Bn - Btrys C & D, defending bridges at VERDUN, 10 E/A, type unknown, on bombing and run flights at avg alt of approx 2100 yds. General area atkd VERDUN, with flares being dropped. Firing unseen with SCR-584 and M-9 Director.

336 rds 90mm and 3345 rds .50 Cal ammo expended.

Category of Claims: 4 Cat Is claimed.

130900 - 000000 - 466th AW Bn (M) - Btry D, protecting 909th and 999th FA Bns. 2 Me 109s flying at low level from E to W engaged by 40mm (SE control) and M-51 MD (MD-9 sight control) while on strafing run. 13 rds 40mm and 546 rds .50 Cal ammo expended.

Category of Claims: 1 Cat I claimed.

162355 - 170106 - 119th Gun Bn (M) - Protecting bridge crossings of the MOSELLE River. All Btrys report a total of 11 engagements against single E/A during time stated. E/A entered defended area both from the N and S, although in the majority of cases from the SE. Alts of approach varied from 1500 to 9000 ft with most flights above 3600 ft. Speeds of E/A were from 300 to 380 mph. Evasive action was moderate and it was habitual for the planes to recede upon being fired on. All firing was unseen using SCR-584 and M-9 Director. 186 rds 90mm ammo expended.

Damage to target: None, no atks reported.

Category of Claims: 3 Cat Is claimed.

180600 - 190600 - 56th AAA Gp - This Group furnished AAA SW warning to the Engr 2207 CB working on the construction of the RR bridge at VERDUN, using SCR-535 for reception. Lights were being used during the hrs of darkness and information as to enemy activity in the VERDUN area was to be relayed to the Engrs so that they could extinguish the lights in the event of enemy atk. This AAASW warning will be continued until the construction is finished.

180601 - 190600 - 467th AW Bn - As No3 gun of Bury B pulled into position 18 Sep, it was ATKD by approx 50 to 100 Germans with SMGs, machine pistols, rifles and other small arms. During the action one man was shot through the calf of the leg and had to be evacuated. Four tires on the vehicle were shot up but no other damage sustained. The atk was halted when an M-51 opened up on the enemy.

190600 - 200600 - 119th Gun Bn - Need for smoke shells if unit is to continue efficiently in a PA role is imperative. It is extremely difficult to conduct a precision registration with present type shells (HE1 with 48, 4AAB, and 87 fuzes). The burst, on ground, is just not apparent to either air or ground observers. In the past two days precision adjustments have been attempted on three occasions with air observation. Out of 81 rds fired, 15 were sensed as lost and no results could be obtained from the few rds visible to the observers. It has been our experience that from 30% to 40% of all mechanical fuzes are duds on impact. Probably more in soft earth. Neither the mechanical fuzes (if they do explode) nor the 48 (out to quick or delay) cause enough effect on impact to be sufficiently apparent to produce any sufficient results. It is felt that smoke shells would remedy this situation.

220600 - 230600 - 467th AW Bn (M) - Gun Sec #4, Bury D, engaged parachute flares at 2230 believed to have been fired by enemy ground troop N of their gun position. Range approx 1200 ft. A total of 9 flares, all white, were fired.

270600 - 280600 - 467th AW Bn - Two (2) half-tracks, M-16, with Provisional Bury E located near PETTONCOURT protecting elements of 79#4 FA Bn were fired on by enemy infantry at 0800A 27 Sep 44. Friendly and enemy troops were so intermingled that it was impossible to return the fire. Both half-tracks were hit and one set afire and destroyed. The Bury Commander, enroute to inspect these tracks was fired on and both he and his driver wounded. He was rescued by a half-track and left at an infantry clearing station at PETTONCOURT.

270600 - 280600 - 44[illegible]th AW Bn - At 2708[illegible], Section four of Bury D was cut off by German troops. Friendly armor had withdrawn from area when a column of Germans appeared on a hill 700 - 900 yards in front of gun position. The crew immediately opened fire with 11 rounds, dispersing the column, killing 8 Germans and wounding 7 others who were later captured.

At about the same time the Germans attempted to set up a machine gun position on forward slope of the hill but retreated when fired upon by M51. Shortly friendly armor came up and pushed the Germans off the hill. The results of this firing on ground troops was excellent, as it prevented the Germans from setting up on high ground with good observation of bridge, road junctions and troop locations. Ammo expended by Bury D during period: 148 rds 40mm, 5600 rds of .50 Cal.

271305 - 000000 - 6524 AW Bn - Protection for river crossings, PA, CP and Troop concentrations of the 80th Inf Div. Two (2) Me 109s appeared from the north, altitude 2,000 ft and opened fire on two (2) observation planes of the 80th Inf Div Arty. 40mm fired upon by AW Guns of this unit E/A departed and headed back over enemy territory. One (1) E/A seen to be smoking heavily and losing altitude. E/A engaged by Gun Secs #2, #3 and #4. 11 rounds of 40mm and 570 rounds of .50 Cal ammo expended.

Damage to target: None, no atk made.

Category of Claims: 1 Cat I.

271305 - 000000 - 482d AW Bn (M) - Bury A protecting 738th FA Bn. Two (2) Me 109s approached from the N and strafed the area of the 738th FA Bn protected by Gun Sec No 3 of Bury A. The 40mm gun of this section fired four (4) rounds at one (1) of the planes and obtained a direct hit in the cockpit of the plane. The plane was seen to burst into flames and was out of control. It then crashed to the ground beyond the hill into enemy territory. During this encounter two (2) other Me 109s approached from the North.

Damage to target: None. One (1) man wounded in leg.

Category of Claims: One Cat I.

AAA WEEKLY INTELLIGENCE REPORT NO 11

Period:
060600A to 130600A

1. Summary of Action.

a. Though remaining at a scale far below that of which it is believed capable, GAF air activity this week doubled that of last week, with 42 raids by 75 E/A reported. This is the most activity recorded over Third US Army zone in more than a month. Of the 42 raids, 7 developed into attacks on ground targets, with no damage reported. Approximately 15% of the E/A were claimed as Categories, all by automatic weapons units. With the exception of 5 raids, all raids were by daylight, the majority being low-level reconnaissance flights with front line troop dispositions and activities occupying most attention. MOSELLE River bridges and traffic also received considerable scrutiny, with other appearances reported over CHARNY, VERDUN and NANCY.

b. Recapitulation of claims (corrected) is as follows:

Week (0600, 6 Oct to 0600, 13 Oct)	Raids 42	No E/A 75	Cat I 4	Cat II 7
To Date (1200, 1 Aug to 0600, 13 Oct)	1301	3596	303	148

2. GAF Tactics Notes.

a. With a few exceptions, most E/A appeared during daylight hours, usually in late afternoon.

b. Most flights were at low altitudes with some strafing and a few bombs dropped. The greater portion of flights apparently were reconnaissance missions, which proved costly to the GAF as daylight combined AW units to fire, claiming 11 E/A, as above.

c. Two attacks, both unsuccessful, were made upon artillery observation planes which scuttled to the safety of AA-protected zones when attacked, the E/A being chased off by AW fire. Other targets attacked were field artillery and armored division trains.

d. Evasive action frequently was violent, with E/A taking full advantage of low cloud cover to aid in escape.

3. Miscellaneous Notes.

a. The 411th AAA Gun Bn fired an interesting counter-battery mission. German AA, firing at a division artillery plane, was fired upon at 12,950 yds by our 90mm guns with the airplane doing the adjusting. Two direct hits were observed and the German 88mm battery was silenced.

b. Two batteries of the 6334 AAA AW Bn recently were used by the 80th Inf Div in the attacks on high ground at MT TOULON and MT ST JEAN. Dug-in M-51's were employed, with results reported to be excellent, and contributing materially to the capture of 375 prisoners, including 10 officers. Such employment, however, is recommended by the battalion commander only in exceptional cases, due to the great wear on materiel. 79,700 rds of .50 cal were fired. 11 gun barrels were lost due to overheating.

The 777th AAA AW Bn (SP) also was used in support of the task forces made up by the 6th Armd Div and fired a considerable number of rounds against ground targets during the advance.

c. Casualties among AA personnel, incurred by driving across road mines, have again been reported, for the first time in a considerable period.

d. For "outstanding performance of duty" for the period 2 Aug to 15 Sep, during which time they were under Third US Army, the commanding General, XV Corps, has officially commended the 23d AAA Group and attached AAA units as follows: 411th AAA Gun Bn, 22d AAA Bowers Bn (Fr), 387th AAA AW Bn (SP), 390th AAA AW Bn (SP), 456th AAA AW Bn, 463d AAA AW Bn and the 537th AAA AW Bn (Most of these units are now under Seventh US Army). During this period they contributed materially to the success of the advance from AVRANCHES to ARGENTAN and the subsequent drive to the SEINE and MOSELLE rivers. A total of 100 Cat I's and 45 Cat II's were claimed and many prisoners were taken, as well. Not one bridge or other protected critical area was damaged, and injury to troops and equipment was "exceptionally small." In a noteworthy period from 21-22 Aug, 60 German aircraft, attacking the MANTES-GASSICOURT bridgehead, were destroyed or probably destroyed by these units.

e. In a recent ceremony at one of the divisions, General George C. Marshall presented awards for heroism to men of the division and attached troops. It is to be noted with considerable pride that of ten awards made, five were given to enlisted men of the 537th AAA AW Bn. A Bronze Star, three Silver Stars and a Distinguished Service Cross were the awards presented.

f. To clarify any confusion arising from terminology employed in discussing new types of aircraft, the following is quoted from USSTAF "Air Intelligence Summary" No. 45, for 17 September 1944:

"'Jet-propulsion' is a general term for power supplied by the thrust of heated gases from a jet orifice, and covers all types of units which produce this reaction.

'Several types of such units are now in use. They can be subdivided into solid or liquid 'rocket' and 'turbo-jets'.

'A 'rocket', either solid or liquid, contains its own oxygen; a turbo-jet pressurises oxygen from the atmosphere for combustion. All three, however, produce a jet whose thrust propels the aircraft to which they are fitted.

'Thus, both the Me 163 and the Me 262 may be described as jet-propelled in contrast to airplanes powered by internal-combustion reciprocating engines driving propellers.

'The type of jet-propulsion in the Me 163 is a liquid rocket, and that of the Me 262 a turbo-jet. The distinction between the two power units is no more complicated than that between a Wright and an Allison engine — both provide power to a propeller by the same internal-combustion principle, but one has its cylinders in-line and the other has them radially."

AAA WEEKLY INTELLIGENCE REPORT NO 12

Period:
130600A to 200600A

1. Summary of Action

a. As though to justify allied estimates of its capabilities, the GAF this week made a large-scale appearance over the Third US Army area. During the night of 19 October, between 2100 - 2300 hours, 128 enemy aircraft made their appearance in a series of 43 raids. 70 enemy sorties were flown over NANCY, alone. No bombs were dropped at NANCY, [illegible] strafing attack was reported upon an AA gun position. One bomb dropped near LEMOUVILLE and infantry units reported some bombing via FOLSCHVILLER-MOUSSON. No damage was anywhere reported. The purpose of the raids is unknown, though railroad yards may have been the intended target. Poor visibility, absence of activity in the yards or heavy anti-aircraft fire may have caused the abandonment of such a mission. Other activity during the week consisted of the usual reconnaissance sorties, with some daylight strafing of forward elements via ARRACOURT and ATHIENVILLE. All strafing planes were shot down and no damage was reported.

b. Recapitulation of claims (corrected) is as follows:

Week (0600, 13 Oct to 0600, 20 Oct)	Raids 58	No E/A 140	Cat I 9	Cat II 3
To Date (1200, 1 Aug to 0600, 20 Oct)	1361	3737	312	150

Ammunition expenditures on AA firing for the week were as follows (number of rounds)

.50 Cal	37mm	40mm	90mm
29,110	145	750	849

2. GAF Tactics Notes

a. In the NANCY raid E/A approached from all directions and at medium, low and very low altitudes using small formations, in a flexible apparently designed to confuse and saturate the defense. Few straight runs were made, as the aircraft continually circled and manoeuvred, gaining and losing altitude. When engaged by antiaircraft, evasive tactics became more positive. Some A/C showing no IFF were overhead at altitudes exceeding 30,000 ft but as these exceeded the AAA limit, none were engaged. "Window" was dropped on a large scale throughout the area.

b. Most other raids were at low-level, with some high-speed strafing of field artillery, antiaircraft and troop concentrations from as low as 50 ft.

c. Jet-propelled A/C are being more frequently reported in the Army area. These planes apparently are used for low-level reconnaissance missions at the present time.

3. Miscellaneous Notes.

a. Attempts at radar interference are increasing. The 120th AAA Gun Bn reported IFF interference, believed to be general radio jamming, taking the form of "grass" high enough to fill the scope.

The 411th AAA Gun Bn engaged a target which released an object not having the characteristics of "window", but on which the SCR-584 locked. Again, a target was picked up which made 5 or 6 additional pips appear on the 32,000 yd scope and 2 or 3 on the 3,000 yd scope, with the narrow gate widened to about 500 yds. These targets traveled at a very slow rate and were tracked in to 2,000 yds. No planes could be heard. At the same time on the FPI scope a number of targets appeared from 5,700‰ azimuth to 1,200‰ at ranges of 10,000 to 15,000 yds. Each target investigated produced a clear pip and was not like window. At the same time a solid blur occurred on the FPI scope from 400 to 1,200‰ azimuth. No pips appeared on the range scope.

The 119th AAA Gun Bn reported considerable window experienced, with radar interference of three types:

(1) A straight line horizontal just above the base line.

(2) "Hash" all the way across the scope.

(3) Waving line, similar in shape to a sine curve.

b. Ninth US Army reports two FW 189s have been identified in the Ninth US Army zone, engaged presumably upon reconnaissance. Family resemblance of this plane and our own P-38 and P-61 should be noted.

c. For support given to the 4th Armored Division in performance of its missions, the 459th AAA AW Bn (SP) has been officially commended by the division commander. In one instance a battery of the battalion engaged a large body of the enemy, resulting in its destruction and the capture of over 500 prisoners.

d. The 119th AAA Gun Bn continues to fire many FA missions. Increased facilities for observation have improved results and the firing has proved highly effective. Bridges, trains, vehicles, forts, personnel and other targets have been engaged, counter-battery missions have been fired, and much damage has been done. Recently a bridge was fired upon at 20,000 yds with good results observed.

DECLASSIFIED

Digitized by Google

e. Following is a tabulation of enemy aircraft claimed, by type. Duplications in battalion claims have not been eliminated, nor excessive claims reduced to category, hence claims are greater than reported in paragraph 1 b hereof. However, the tabulation has sufficient accuracy to indicate E/A types in use and destroyed or damaged by AAA units of the Third US Army.

Type	No E/A Engaged	Claimed Cat I	Cat II	Cat III
Me-109	1031	101	53	8
FW-190	765	100	29	1
Ju-88	124	3	10	0
Me-410	23	1	2	0
He-111	16	1	1	0
Me-110	6	0	1	0
Ju-52	5	3	1	0
Ju-87	5	0	0	0

AAA WEEKLY INTELLIGENCE REPORT NO 13

Period:
2000 23AA to 2706 00A

1. Summary of Action

a. Enemy air activity slackened off and a week of comparative inactivity was reported, as the GAF failed to make any show of strength, flying only the normal number of reconnaissance missions with one reported strafing attack to vary the pattern. Appearances were by single planes for the most part. Again most flights were by daylight and at low level, as ground dispositions and activities were reconnoitered. Aircraft literally flew from cloud to cloud, keeping well out of AAA range where possible and taking evasive action when engaged. Most flights were reported over forward areas, with others over VERDUN, NANCY and TOUL, as well as the usual flights up and down the MOSELLE River. AAA Gun battalions claimed 2 Cat I's from nighttime engagements and AAA AW battalions 3 Cat I's during daylight.

b. Total claims for the week and to date (corrected) are as follows:

Week	Raids	No E/A	Cat I	Cat II
(0600, 20 Oct to 0600, 27 Oct)	29	31	5	0
To Date				
(1200, 1 Aug to 0600, 27 Oct)	1390	3768	315	148

2. GAF Tactics Notes

a. Most of the 29 raids were flown at low altitude (0 - 6,000 ft) with the few medium level (6,000 - 15,000 ft) flights reported flown during darkness.

b. All night raids were reported between 2300 - 0130 hours and daylight raids between 1215 - 1330 hours (with the exception of 1 at 1545) or, roughly, noon and midnight.

c. No new tactics were reported.

3. Miscellaneous Notes

a. The first actual engagement of a jet-propelled A/C by Third US Army antiaircraft was this week reported when the 551st AAA AW Bn fired at one. It was described as being a little larger than a P-47, with square wing tips, wings set about the center of the fuselage, and no dihedral. Several jets in the rear emitted many sparks. It made a distinctive sound, much louder than an ordinary plane, and was in hearing for about 2 minutes, though in sight for only 30 seconds. (Later description fits an Me-262) As it flew S at approximately 500mph and 1,000 ft altitude it was engaged by .50 cal fire and believed to have been damaged. The race battalion also engaged and shot down a rarely-reported Do-217 which was attempting to strafe.

b. Latest figures obtained from the XIX TAC show the following number of A/C estimated as available to the GAF:

	SAF	FTF	Total	Lab
NW Germany	550	200	30	105
SW Germany	250	140	20	0
TOTALS (Western Germany)	810	640	50	105

Of these, 400 single-engine fighters and 200 twin-engine fighters are within operational range of the Third US Army front. All of the long-range bombers and twin-engine jet-propelled A/C are also within this range. Of these A/C approximately 60 - 65% are flyable at any given time, maintenance requirements keeping the remainder on the ground. The Luftwaffe is believed capable of mounting an offensive against Third US Army by up to 200 A/C at any time.

c. Given below are the "batting averages" of the AAA battalions operationally attached or assigned to this Headquarters. Percentages given are based upon total enemy planes reported to have been fired at and total Category I's and II's approved by Third US Army.

		Total I & II	No E/A Engaged	Average
1.	777th AAA AW Bn (SP)	18	48	.375

AAA WEEKLY INTELLIGENCE REPORT NO 14

Period:
270 19AA to 0306 00A

1. Summary of Action

a. There were 20 raids by 23 enemy aircraft — and that about sums up this week's hostile air activity. No attacks were made against ground targets, no new tactics noted. Sorties flown were equally split between low and medium altitudes and between hours of darkness and hours of daylight. Daylight appearances occurred during early morning and noon hours, while most night flights were reported between 2000 - 2300 hours. All missions apparently were for reconnaissance, flown over forward elements in the main, but also reported over PONT-A-MOUSSON, NANCY, ÉPINAL and VERDUN.

b. Total claims for the week and to date are as follows:

Digitized by Google

	Raids	No A/A	Cat I	Cat II
Week (0600, 27 Oct to 0600, 3 Nov)	17	43	4	3
To Date (2200, 1 Aug to 0600, 3 Nov)	379	1,125	319	152

2. GAF Tactics Notes

No new tactics were reported.

3. Miscellaneous Notes

a. The 441th AAA Gun Bn reported another type of radar interference. Battery C reported that at 2030 hours a streak was found on the FFI scope from an azimuth of 240°, range 20,000 yds, to an azimuth of 360°, range 16,000 yds and elevation of 250. At 2053 hours a plane was picked up which dropped something giving an extremely good echo at about the same strength as the plane's echo. On the 30,000 scope the series of pips left behind appeared as a number of good echoes. Approximately 5 minutes later, a clear streak was still evident on the FFI scope where the course of the plane had been. A similar phenomenon appeared at 2110 hours. Planes gave no IFF. The material dropped seemed to be window or a similar substance which gave a very good echo and seemed to have small dispersion.

b. Anti-mechanized training, with German half-track personnel carriers as targets, has been conducted by the 449th AAA AW Bn. HE shell was reported to be effective, smoking the armor plate and blowing it apart, though solden penetrating it on the first round. Firing was done at approximately 600 yds. Remarks of the Battery Commanders were reported as follows:

(1) The major adjustment necessary is elevation.

(2) Once the target is registered-in with Stiffkey Stick, succeeding rounds all are in, too.

(3) The No. 7 man, using hand or knee, fires more successfully than the No. 9, as the latter tends to depress the gun muzzle when stepping on the firing pedal.

c. Three enlisted men of the 693d AAA AW Bn have been conducting classes in aircraft recognition for the officers and men of the 80th Inf Div. So far, 1200 men of the FA and Inf have received instruction.

d. An engineer battalion, pressed for time, has been working at night under floodlights on the construction of a bridge. Concerned about enemy air attack, it asked for air warning service, and now receives it from the 457th AAA AW Bn. Battery B operations room transmits warnings of unidentified or hostile planes to the Engr Pond CP at the bridge site, where lights are extinguished until the "all-clear" is given.

e. Two batteries of the 119th AAA Gun Bn, Batteries C and D, have been the subject of official commendation. Since these are semi-aircraft units, it is unusual that the commendation was given by the Commanding General, XX Corps Artillery, for their performance in a field artillery role. From the period 14 September to 3 November, they expended over 10,000 rounds of 90mm ammunition upon artillery missions. Especial note was taken, among other missions, of a mission on 5 Oct, when a projected counter-attack by elements of the HEFT OCS Rgt, via FF DELAMY and FF MARIVAL, was so disorganized by fire that the attack was never launched. Again, on 29 Oct, the fire from C Btry contributed materially to the unrelentingly successful attack by elements, 90th Inf Div, upon MAIZIERES-LES-METZ.

f. Using paper captured from the retreating Germans, the 440th AAA AW Bn publishes a daily "News and Intelligence Summary". Besides giving the news, day by day, it keeps the men abreast of the local military situation. Best feature, however, from a practical standpoint, is the airplane silhouettes reproduced in various attitudes of flight to keep all men constantly refreshed in aircraft recognition.

This organization also claims to be the first Antiaircraft unit to have given battlefield appointments. Two platoon sergeants recently received their commissions as second lieutenants on the battlefield.

13 November 1944

AAA WEEKLY INTELLIGENCE REPORT NO 15

Period:
0300GA to 1006GA

1. Summary of Action

a. The German Air Force reacted slowly to the Third US Army's attack the morning of 8 November, and it was not until mid-afternoon that it put in an appearance. 10 raids by 33 A/A were reported at that time, with Fritz being most interested in reconnaissance, as only one attack by one Me 109 was made. This day's small effort accounted for most of the week's 43 sorties. Over the week, most appearances were at low altitudes as poor visibility and low clouds forced enemy reconnaissance planes to hug the ground. Two strafing attacks were reported for the week, one by an Me 111 against AAA positions in NANCY during darkness, and the other by day against field artillery as mentioned above. One was claimed shot down, the other a probable. Other engagements with recce planes brought the week's total claims to 4 Cat I's and 3 Cat II's. Most A/A were reported by AAA units protecting artillery in the forward zones of divisions, but others were reported by AAA deployed at crossings over the MOSELLE and SEILLE Rivers. None were noted West of the MOSELLE. Two buzz-bombs (pilotless aircraft, V-1) were reported and fell harmlessly, causing very minor damage. They were not engaged by antiaircraft fire.

b. Total claims for the week and to date from 1200 hours, 1 August 1944, are as follows (corrected):

	RAIDS	NO A/A	CAT I	CAT II
Week	17	43	4	3
To Date	1409	3835	319	152

	PAC OVER AREA	PAC ENGAGED	CAT Ae	CAT Be
Week	2	0	0	0
To Date	31	14	0	2

Ammunition expenditures for the week (trial fire excluded) are as follows:

90mm	40mm	37mm	.50 Cal.
173	357	10	8,906

• Cat Ae - exploded in air by AA fire
Cat Be - caused to crash by AA fire

2. GAF Tactics Notes

a. Me 109s were the A/A most commonly encountered. Other types reported — FW 190s, Ju 88s, He 111s. These appeared singly or in twos for the most part, with formations of 4, 5 and 6 reported on 8 November.

b. A/A were about evenly divided between night and daytime sorties, though 8 November's daylight sortie tilt overall totals for the week toward daylight predominance.

c. The two PAC appeared at approximately 2300 and 1300 hours, flying roughly North to South at low altitudes.

[illegible] altitudes of 2,000 - 3,000 ft and took [illegible] by AAA. Usually this consisted of [illegible] acrobatics.

DECLASSIFIED

c. Third US Army's first three months' operations furnish a fair basis for study of targets attacked by the GAF. During August, with ground activity violent and flying weather good, the enemy mounted 1,117 raids by 3,213 A/C, an average of 2.87 A/C per raid and 103.6 A/C per day. Most such raids terminated in actual attacks against ground targets. September and October, on the other hand, saw increasingly poorer flying weather, a much slower and less threatening rate of advance on the ground, and correspondingly less hostile air activity. September's totals were 128 raids by 287 A/A and October's were 144 raids by 269 A/A, giving averages of daily activity far below those for August. Furthermore, most aerial activity was for reconnaissance, as reflected in the percentages shown under "Targets Unknown or No Attack Made" in the tabulation below. (In this category are included instances where attacks were made but the target was hidden by terrain features from reporting units, as well as raids which merely passed overhead, possibly to attack some more distant target, or possibly for reconnaissance only). Since we are again advancing and may expect heavy aerial thrusts at any time, the table below may prove of value when read in the light of ground activities during the particular month involved.

	AUGUST		SEPTEMBER		OCTOBER

3. Miscellaneous Notes

a. As the Third US Army advance proceeds, reports of casualties from AA units are multiplying. Offsetting these losses, however, are the many prisoners captured and casualties inflicted on enemy ground troops by antiaircraft elements. The 693d AAA AW Bn recently was called upon by division G-3 to emplace M51 mounts in support of the division's attack. After a map reconnaissance and a ground reconnaissance conducted under enemy observation, positions were selected for the emplacement of those M51 quadruple .50 cal mounts. Positions were prepared by hand during daylight, tree-covered, defiladed positions being selected where possible. Positions were occupied during darkness with great difficulty, due to excessive mud and wet ground. Prime movers and bull-dozers stuck in the mud, and only one platoon finally was able to occupy its positions.

Targets selected included two 88mm gun positions, one 75mm gun position and several mortar positions. All trucks were left in the ammunition upon request of an Inf Bn Commander, who desired the morale effect which his troops derived from observation of the tremendous fire poured out by the machine guns. After fire was opened, not one of the enemy artillery positions fired a shot, and the supported infantry battalion was successful in its mission. 10,500 rounds of .50 cal ammunition were fired.

b. Since beginning of operations, at 1200 hours, 1 August 1944, Third US Army Antiaircraft Artillery has expended considerable ammunition in a ground role, both as field artillery and in close support of infantry and armor. Expenditures to date in this capacity are tabulated below:

90mm	40mm	37mm	.50 cal
22,032	3,378	4,560	282,298

This compares with ammunition fired solely at enemy aircraft as follows (trial shot fire included):

90mm	40mm	37mm	.50 cal
24,791	22,816	22,661	1,331,587

c. To enable the 8th Air Force to bomb accurately in the recent large-scale bombardment in the METZ area, four batteries from three AAA Gun Battalions on a pre-set, coordinated mission fired continuously for almost an hour, establishing two visible lines of flak bursts at high altitude from which Air Force navigators found their true position with reference to the ground. The batteries were moved a considerable distance to perform this mission and experienced great difficulty getting into position due to ground and weather conditions. A total of 1,800 rounds of 90mm were fired.

AAA

Digitized by Google

c. With many AAA units deployed in protection of bridges, the record rise of the MEUSE and other rivers caused considerable difficulty to dug-in antiaircraft guns. Gun crews were marooned for some time by the floods and had to be evacuated by engineer assault boats; some equipment was under water before it could be moved to higher ground. Heavy mud conditions complicated matters tremendously.

c. The 27th AAA Group some time ago completed arrangements with a Quartermaster Repair Company to manufacture heavy canvas covers for the Skiffbay Sticks of all Automatic Weapons units so equipped. Recently, these covers were completed, and XII Corps and its Division AAA AW Battalions now have been furnished with the covers so badly needed under current conditions.

AAA WEEKLY INTELLIGENCE REPORT NO 16

Period:
121600A to 170600A

1. Summary of Action

a. From the fact that 22 rounds of 90mm ammunition represents this week's total antiaircraft expenditures, it may be seen that a week noteworthy for lack of hostile air activity was enjoyed. Bad weather kept enemy air efforts in Third US Army area at minute proportions. A total of 4 raids by 5 E/A were all that AAA units reported. No attacks upon ground targets were made. Antiaircraft engaged one E/A and made no claims. 22 buzz-bombs (V-1) and 1 rocket-bomb (V-2) were reported over the area, with no damage anywhere reported. None were engaged.

b. Total claims for the week, and to date from 2400 hours, 1 August 1944, are as follows:

	Raids	No E/A	Cat I	Cat II
Week	4	5	0	0
To Date	1413	3820	339	252

	RAC OVER AREA	RAC ENGAGED	CAT A	CAT B
Week	13	0	0	0
To Date	44	24	0	2

2. CAP Tactics Notes

No new tactics were reported.

3. Miscellaneous Notes

A tabulation of daily claims for the month of October is given below.

AAA WEEKLY INTELLIGENCE REPORT NO 17

Period:
170600A to 240600A

1. Summary of Action

a. Taking advantage of good flying weather the first three days of the week, the German Air Force made several sharp, small-scale attacks against ground troops in forward areas. Two Me-109's dropped anti-personnel bombs or mines and seven strafing attacks were made by formations of one, two or three aircraft. Other flights presumably were for reconnaissance and though several of these E/A were observed to carry bombs, no bombing was reported other than that mentioned above. Targets attacked were field artillery, armored columns, troops, vehicles and antiaircraft, with one attack on a Cub observation plane. Most reconnaissance flights reported were in forward areas, with a few others over THIONVILLE, PONT-A-MOUSSON, FROUARD, NANCY and TOUL. 35 of the raids were at low altitudes (300 - 6,000 ft) and most were during daylight hours. 22 E/A were observed the 1st day of the week and 31 the second day. Thereafter, activity dropped and the week's total was 70 E/A reported. Some other A/C were detected by radar but identification in most cases was inconclusive so those were not counted in the totals.

b. Low cloud ceilings and resulting enemy tactics combined to give automatic weapons units many good targets, resulting in their claiming 9 Cat I and 9 Cat IIs, or approximately 22% of all E/A destroyed or probably destroyed. No damage to materiel was reported as a result of the air attacks and but a few personnel casualties. Totals for the week, and to date from 2400, 1 August 1944, are as follows:

	Raids	No E/A	Cat I	Cat II
Week	46	70	9	9
To Date	1459	3890	348	261

	RAC OVER AREA	RAC ENGAGED	CAT A	CAT B
Week	2	0	0	0
To Date	46	24	0	2

Ammunition expenditures on AA firing for the week were as follows (number of rounds):

.50 Cal	37mm	40mm	90mm
73,571	284	2,636	34

2. CAP Tactics Notes

a. No particularly new tactics were noted. The Germans practically hugged the ground on many of their attacks and are reported to have strafed without using evasion. On one occasion, E/A flew so low that AAA could not fire for fear of endangering friendly troops on nearby hills. On another, an E/A flying at 300 Ft tried to avoid AAA fire by diving still lower, and being unable to pull up, crashed.

b. AAA fire drove off all attacking A/C, as none chose to press home an attack, once fired upon. However, evasive tactics frequently consisted only of a fast climbing turn, with the plane thereafter circling out of range.

c. The Teutonic tendency toward routine has in the past led to several enemy aircraft losses. This week Pilot made a reconnaissance plane to fly the same course, the same time, each day. Alert AAA crews anticipated its arrival and on the third day the plane did not go home.

d. During darkness, E/A often fly into protected areas at slow speeds, cutting their motors and gliding to minimize chances of detection from the ground. When discovered and fired upon, motors are gunned and quick changes of direction are made in evidence.

3. Miscellaneous Notes

a. In order to insure that "hold fire" and other such operational orders are received by AAA Gun Battalions, separate elements thereof, or restricted area commanders, the 30th AAA Brigade recently secured the loan of "Link" FM transmitters and receivers from XIX TAC. Using these Link radios, an instantaneous, two-way FM radio communication has been established between the Army AACP and units whose fire is controlled from there. In addition, wire has been laid from AAA Gun Battalions to all Army Automatic Weapons units located within the IAZs. Use of this system has proved most effective in preventing fire upon friendly A/C which, without prior warning, occasionally wander into an IAZ contrary to present flying rules.

b. The alertness of C Battery commander, 465th AAA AW Bn (SP), in discovering and reporting conditions at a large supply point protected by his battery, may have saved the army large quantities of vital supplies. As a result of his report, the supply point was moved to a safer location less open to sabotage and away from suspected civilians. In addition, this intelligence-conscious officer has submitted reports of new types of mines and booby traps which have been of considerable value to the Enemy Equipment Intelligence Services (EEIS) of this Headquarters.

c. Further reports have been received on the results of recent ground support missions by AAA units. Engineers constructing a bridge at CLERMONT, over the SEILLE River, were fired upon, November 28th, by hostile machine guns and small arms from prepared positions across the river. D Battery, 467th AAA AW Bn (M), giving air and ground protection to the construction crews, fired 18 rounds 40mm and 1320 rounds .50 cal silencing the enemy. Later investigation revealed that the positions silenced were heavy earth breastworks, partially covered with light metal. The metal covering had been thrown aside and considerably chopped up by 40mm fragments. Tree bursts from the 40mm HE had sprayed the positions, killing machine gunners and riflemen.

Batteries B and D of the 796th AAA AW Bn (SP), attached to elements of the 10th Armd Div, fired 12,300 rounds .50 cal and 60 rounds 37mm supporting the advance into Germany. Some sections were sub-attached to combat patrols spearheading the drive. Missions included spraying woods, buildings and prepared enemy positions, as well as covering an infantry squad sent to rescue crews of burning tanks. 40 PWs were taken and 50 enemy were known to be killed, with many more probably killed and others wounded and burned as incendiaries set fire to buildings.

Digitized by Google

d. The 119th AAA Gun Bn experienced a new type of radar interference, which they have termed "step jamming", the [illegible] number. The phenomena was picked up by two separate radars [illegible] three occasions. An operator in B Battery, corrobo[illegible] one from A Battery, reported as follows:

"We picked up a plane and I challenged him with IFF. His return signal appeared on the scope, plus a number of identical signals. The other signals were all over the scope and seemed to be returned from other planes, but there were no other planes than the one being tracked. My IFF signal was perfectly on the step as I reported IFF on this plane. Both the plane's return signal and the interference continued as I kept challenging him. I dropped the plane but the interference remained.

The signal from both plane and interference were unusually narrow in width. Also, the caps were very bright while the side lines remained very dim. This interference continued for some time and then died out. It returned several minutes later, however. I changed my azimuth and found I could pick it up almost any place." Since numerous contacts were made by both radars, both before and after this phenomenon with no unusual effects, battalion considers a new type of jamming was experienced.

e. A point of interest arose from a meteorological message taken at 1645, 20 November, by the 413th AAA Gun Bn. Ballistic winds in zones #5 thru #11 varied from 69 - 73 mph, all being in excess of the 60 mile maximum wind compensation provided for by the M9 director.

f. Casualties from artillery fire, mines and booby traps continue to be reported by AAA units as assuming enemy resistance is encountered. More than offsetting these, however, are the many PWs taken by AAA battalions. A check of figures shows that more than 8,500 PWs have been taken since the beginning of operations, with many battalions making no report of PWs turned over to division enclosures for interrogation and processing. The 777th AAA AW Bn (SP), attached to 6th Armd Div, has reported taking 700 PWs, the greatest number reported by any battalion.

g. Thirty-six officers and enlisted men of the 390th AAA AW Bn (SP) recently were awarded Bronze Stars in connection with operations from 27 July to 9 November by the Commanding General of the 26th Inf Div. Of these, one was a posthumous award.

h. The 469th AAA AW Bn (SP) which as late has suffered a number of casualties during the advance of the 4th Armd Div, to which it is attached, recently announced the battlefield appointment of one of its Staff Sergeants to the rank of 2nd Lieutenant.

AAA WEEKLY INTELLIGENCE REPORT NO 20

Period:
2400A to 0100A

1. Summary of Action

a. Little hostile air activity was reported this week. Once again, the GAF was content to fly a minimum number of reconnaissance missions covering Third US Army area. Some flights were reported by front line units, but the majority were reported by units via THIONVILLE, PONT-A-MOUSSON, NANCY and VERDUN. A total of 35 E/A were over the area, flying at low and medium altitudes. Only 2 of these appeared by daylight. Of the 35 E/A, 11 were engaged by AAA units which claimed a total of 3 Ost I's as a result. No attacks on ground troops or installations were reported.

b. Activity by pilotless aircraft kept far behind that reported [illegible] by First and Ninth US Armies, but this week's total of 45 represents a substantial increase over the number of PAC previously observed in Third US Army area. Both V-1's and V-2's were reported, the latter climbing [illegible] altitudes and disappearing. V-1's were observed at altitudes ranging from 1,000 to 6,000 ft, and traveling at speeds of 200 - 400 mph. The usual time of appearance was late dusk or early dawn, and direction of travel was E-W or NE-SW.

c. Totals for the week, and to date from 2400, 1 August 1944, (corrected) are as follows:

	Raids	No E/A	Ost I	Ost II
Week	32	35	3	0
To Date	1,467	3,905	331	160

	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	45	6	0	0
To Date	89	80	0	2

2. GAF Tactics Notes

No new tactics were reported.

3. Miscellaneous Notes

a. XIX TAC advises that the German Air Force is steadily building up strength in western GERMANY. Poor flying weather and consequent lessening of attrition, as well as tactical necessity, has fostered the improvement of its position. Estimates of current strengths are as follows:

	SEF	TEF	TRInst	IRD
NW Germany	790	500	90	120
SW Germany	240	130	30	0
Totals, western Germany	1,030	630	80	120

Comparison with figures last published in AAA Weekly Intelligence Report No 13 reveals a marked increase in single-engine fighter strength. Of the above totals, approximately 1,450 SEFs and 200 TEFs are within operational range of Third US Army and could be used at any time. Of these, 65% are believed to be flyable at any given time, with the remaining 35% grounded for maintenance.

b. A platoon of C Battery, 547th AAA AW Bn, recently supported division elements in an attack upon FT JEANNE D'ARC in the METZ group. Its mission was to fire in front of the advancing infantry, shifting later to the main fort to force it to "button up". Reconnaissance was made at night under considerable difficulty, but defiladed positions finally were selected, 200 yds to the rear of the infantry line of departure. Four 40mm guns were placed on line approximately 40 yds apart. Only one M51 could be winched into position due to heavy mud. Firing data was secured from a map and guns were laid using a GERNERS' quadrant and lensatic compass from firing table data. In addition, an OP was established to direct fire. Positions were occupied for two days and targets included two observation towers in the fort (which were destroyed), as well as call missions on pin-point targets requested by the infantry. Original targets were abandoned due to limited visibility. The platoon was credited with killing a considerable number of the enemy and encouraging the surrender of others, as the infantry pressed on to reach its objective. In addition, 20 prisoners were taken directly by AAA personnel. Enemy artillery dropped 40 shells in the platoon area, and fire was drawn from an enemy machine gun 300 yds south of the position. However, neither casualties nor damage resulted.

c. For their courage in establishing the observation post mentioned above, and maintaining it in the face of heavy and accurate fire from all caliber and type of weapons, two privates who volunteered as observers were awarded Silver Stars. On one occasion, an enemy shell burst in the very room of the house from which they directed fire.

d. Four enlisted men of the 390th AAA AW Bn (SP) were recently awarded the Soldier's Medal by the Commanding General, 26th Inf Div, for heroism displayed in rescuing crew members of a friendly A-20, which had crash-landed in deep water.

e. An unusual chain of circumstances recently resulted in dam[illegible] round of 105mm, fired by a [illegible] and power line. Shell frag[illegible] [illegible] gun section, which exploded [illegible] ruptor on a Bofors gun.

f. Below is a tabulation of claims made by AAA units for the month of November.

g. Corrections: AAA Weekly Intelligence Report No 17 stated that the 777th AAA AW Bn (SP) had taken 700 PWs. The Battalion Commander has written to advise that the battalion lays no claim to exclusive credit for all captures. In several instances, it was stated, the battalion assisted in the round-up of large numbers of prisoners, and did not [illegible] the captures alone.

AAA WEEKLY INTELLIGENCE REPORT NO 19

Period:
0100GMT to 0806GMT

1. Summary of Action

a. A quiet week was experienced by Third US Army Antiaircraft Artillery, as enemy air activity remained at low level. Only 13 E/A were reported over the area in a series of 9 raids. Of these, 5 were engaged by AAA, but no claims for their damage or destruction were made. A strafing attack was made against elements of the 14th Armd Div by Fw-51s reported to carry German markings and 8 bombs landed via DEIRACH. No damage to military installations was reported as a result of these occurrences and, other than these, no attacks were made. The E/A over the area were observed to fly at low and medium altitudes engaged, apparently, upon reconnaissance. Raids were almost evenly split between night and daytime. Afternoon and early evening were the most favored times of appearance, as only one morning flight was reported and none from midnight to dawn.

b. 9 pilotless aircraft were reported, of which 3 were engaged by AAA without result. These generally flew a N-S course, though one was seen to fly West.

c. Totals for the week, and to date from 1 August, 1944, are as follows:

	Raids	No E/A	Cat I	Cat II
Week	9	13	0	0
To Date	1,476	3,918	331	160

	TAC OVER AAA	TAC ENGAGED	CAT A	CAT B
Week	9	3	0	0
To Date	98	25	0	2

2. GAF Tactics Notes

a. No new tactics were reported in this area.

b. Demonstrating that the GAF is far from dead, First US Army this week reported a daylight attack by approximately 60 enemy fighter aircraft against motor transport, troops and installations of V and VII Corps. The attacks were made from very low altitudes, in the main, and involved both bombing and strafing. An interesting feature of the attack was that, at the time, IX TAC planes were grounded by bad weather surrounding their airfields and could not rise to counter the blow. In all, First US Army reported 74 E/A overhead during the 24 hour period encompassing the above raid. Of these, AAA units claimed the considerable number of 30 Cat I's and 23 Cat II's, which must have made Fritz most unhappy. (Source: AAA Sitrep No 123, First US Army)

This repeats a strategy employed by the GAF in its attacks against XV Corps (then under Third US Army) at the MANTES-GASSICOURT crossings of the SEINE River on 21-22 August. There, attacks by as many as 117 E/A were made at a time when bad weather in the rear of the army kept all XIX TAC A/C on the ground.

c. Bad weather apparently affects hostile air activity in other ways as, during periods of poor visibility, a considerable increase in numbers of pilotless aircraft has been noted in Ninth US Army zone. (Source: Weekly AAA Notes No 10, 95th AAA Brigade)

d. As to the use of V-weapons, it is evident they are not being used as haphazardly as in recent times. Specific targets have been selected and the occasional V-1s and V-2s seen flying in this area are believed to be malfunctioning eccentrics for the most part, though a few may be launched with harassment in mind. SHAEF has stated that: "... It is becoming increasingly obvious that he (the enemy) realizes port facilities are the most profitable targets..." (Source: SHAEF Weekly Intelligence Summary No 35)

e. First US Army also reported an attempt by 6 E/A to dive-bomb and strafe an engineer bridge during hours of darkness. As dive-bombing is a rarely employed tactic, the event is worthy of notice. (Source: First US Army Sitrep No 124)

f. In view of the above, the appearance in recent weeks of the antiquated Ju-87 — the dread "Stuka" dive-bomber of other days — is worthy of note and indicative of the German determination to reinforce his air strength in the West in an effort to counter the mounting threat to his lines of defense. Use of these has been reported in the northern sectors of the allied front, so that tactics employed and targets selected merit some attention. Use of this type aircraft has been restricted almost entirely to night operations. The following information is based on reports of crews of Ju-87s captured when their planes were shot down by AAA:

"The usual types of target include, in their order of priority, troops preparing to attack, artillery positions, tanks and M/T concentrations and M/T supply routes. Crews are invariably given a definite objective, and no free-lance operations are flown. Ground strafing attacks are not carried out."

"Occasionally an alternative target is given at the briefing and crews are sometimes told that if they are unable to locate or attack the given target, they should release their bombs over any suitable concentration of ground forces observed."

"Bombs used include H.E., fragmentation and incendiary types according to the nature of target assigned. On occasion loads as heavy as 1,500 kg. and even 1,800 kg. are taken."

"The standard laid down in regard to weather conditions is a minimum of 4/10ths cloud for cover purposes, and visibility of at least 5 kms. Operations are not flown during the period extending from about three days before to three days after full moons."

"Aircraft take off individually at fixed intervals of from one to five minutes, and fly independently to their objective. After flying at about 1,000 feet, they begin to climb when approaching the Allied lines so as to attain a height of from 3,500 to 7,000 feet when crossing the front line; altitudes between these two limits are considered best for bombing, so that an effective spread of anti-personnel bombs is insured. After the release of the bombs height is lost to between 600 and 1,000 feet, and the homeward course is flown at about this altitude."

"The speeds flown on operations by JU 87 D-5's are stated by P/W to be as follows:

Outward flight at height of about 1,000 feet	250 - 260 k.p.h. A.S.I.
Outward flight after climbing to the usual operational altitude of about 3,500 to 7,000 ft	260 - 270 k.p.h. A.S.I.
Homeward flight at low altitude	About 270 k.p.h. A.S.I.

"...flares are often used to mark the target...The normal parachute flare is used, released from 2,500 to 3,000 feet, the colours employed being white or orange.."

"Duppel ("window") is used on a fairly extensive scale, and evasive action is taken against night fighters and AA."

"No special instruction on the type of evasive action had been given to P/W, but crews of N.S.G.1 had discussed this aspect soon after arrival at Bonningharde/South, and at the base of N.S.G.2 at Wahn a meeting presided over by the Staffelkapitan, was called during the last week in October for the purpose of free discussion on the best type of evasive action to be taken."

"It was generally agreed that continuous and somewhat violent weaving with continuous changes in height offered the best solution, and it was thought advisable to adopt this tactic on both the outward and homeward course."

"On operational flights made by present P/W, considerable weaving involving 45 degree turns was resorted to; on one flight, evasive action was carried as far as a turn at 360 degrees." (Source: Ninth Air Force Intelligence Summary No 108)

3. Miscellaneous Information

a. On December 2d, the 390th AAA AW Bn (SP) committed half-track elements to a ground role, supporting elements of the 26th Inf Div in an attack upon a wooded area. A previous infantry attack on the area had been repulsed by automatic weapons and observed mortar fire. The commander of the Regimental CT asked for a recommendation for AAA fire upon the area. A reconnaissance was made and recommendation submitted that fire be delivered from a town approximately 1,200 yds from the edge of the woods. This was accepted, and a platoon of 4 M-15 and 4 M-16 half-tracks was moved to the town. This move was made during darkness as the approaches were under enemy observation.

Weapons were fired upon order from the commander of the Inf Bn making the attack. 37mm HE fire was used to produce brush bursts over foxholes and trenches known to be in the woods, and 37mm AP was fired against fortified emplacements which possibly included concrete pillboxes. A total of 29,600 rds .50 cal, 760 rds 37mm HE and 25 rds 37mm AP were fired. The fire is believed to have kept enemy troops effectively pinned down — more closely pinned than the previous days' artillery preparation did.

A similar mission was fired on 3 December, targets including a small town, as well as two wooded areas. Weapons were moved up under cover of darkness and backed into position between buildings just prior to firing. Some buildings in the village attacked were set afire and a church steeple, possibly used as an enemy OP, was shattered. When firing ceased, our infantry entered town and woods without opposition. For this mission, 16,133 rds .50 cal, 563 rds 37mm HE and 80 rds 37mm AP were fired.

The battalion commander concluded that:

(1) Small towns offer very good cover and approaches for half-track AAA ground fire functions.

(2) Weapons should be taken in under cover of darkness, if possible.

(3) Enough weapons should be brought to bear on the area to maintain continuous intermittent fire for a sustained period.

(4) The entire area should be covered by fire, especially those places which would most likely be used as an OP for mortar fire. The initial burst of fire should be strong enough to cause the enemy to button up completely.

b. Casualties among AAA units continued to climb as artillery, mines and booby traps took their toll. Total casualties were 27 killed and 53 wounded, for the week. Most of these were from artillery fire, though the explosion of a time bomb in the building occupied by Hq & Hq Btry of one AAA AW unit caused the death of 19 officers and men, and wounded 17 others.

AAA WEEKLY INTELLIGENCE REPORT NO 20

Period:
0806OOA to 150600A

1. Summary of Action

a. German air activity this week was negligible, but 6 E/A being overhead, one on high altitude reconnaissance and the remainder flying at low and medium altitudes. No attempt was made upon ground targets. Four of these A/C were observed over SAARLAUTERN, one at PONT-A-MOUSSON and one over 35th Div Army. AAA engaged 5, resulting in claim for 2 Category Is by an AAA Gun battalion. Two FW190 were observed, but neither crashed in the area.

b. Totals for the week, and to date from 1 August 1944, are as follows:

	Raids	No E/A	Cat I	Cat II
Week	6	6	2	0
To Date	1,482	2,984	353	160

2. GAF Tactics Notes

No new tactics were reported.

3. Miscellaneous Notes

a. At the request of a Cavalry Rcn Sq Commander, 4 half-tracks of the 796th AAA AW Bn (SP) - attached 10th Armd Div - this week performed a special road-clearing mission, firing into woods, at houses, emplacements and pavements. 117 rds 37mm and 2,300 rds .50 cal ammunition were expended, resulting in destruction of 3 houses, a machine gun emplacement, 2 small ammunition dumps, some mines, and causing an undetermined number of enemy casualties.

b. The same battalion was singled out for commendation by the Commanding General, 10th Armd Div, for the low rate of trench foot cases reported during the past month.

c. Reference radar interference reported in paragraph 3 d, AAA Weekly Intelligence Report No. 17, the Signal Section of Twelfth Army Group has advised that it probably was a case of "Squittering IFF", caused by maladjustment of the transponder in the aircraft. Procedure has been established so that the pilot may be quickly notified and his IFF equipment adjusted to prevent further occurrences.

26 December 1944

AAA WEEKLY INTELLIGENCE REPORT NO 21

Period:
150600A to 220600A

1. Summary of Action

a. It was not until mid-afternoon of December 17th — 36 hours after the German counter-offensive began — that the Luftwaffe visited the Third US Army zone. One strafing attack was reported that afternoon and a flurry of reconnaissance flights was reported over XII and XX Corps zones, as great interest in troop movements in those areas was evinced. Thereafter, hostile air activity declined until December 21st, when the first indication was given of the large-scale activity to follow. 39 E/A were over the area on that day. 10 strafing attacks were made during the week but no bombings were reported by AAA units, though other sources reported bombing of troop concentrations and the dropping of butterfly bombs in XX Corps area. One unconfirmed report of rocket-firing was received. Most attacks were during hours of darkness with only two made by daylight. All attacks were by single A/C, whose missions apparently were to harass convoys and other road traffic. Field artillery was also strafed and, for the first time since Third US Army became operational, airfields in its area were attacked. No damage from the attacks was suffered by any AAA-protected installation or unit. Most reconnaissance, likewise, was flown at night as improved visibility and use of lights by vehicles aided this mission. Areas mainly covered were highways along the river leading north from METZ to THIONVILLE, where photographic flares were dropped, the SAARLAUTERN and SARREGUEMINES areas, and a few flights reported over NANCY and LUXEMBOURG. 2 PAC (a V-1 and a V-2) were reported observed from the SAARLAUTERN IAF. Neither is known to have crashed.

b. Totals for the week, and to date from 1 August 1944, (Corrected) are as follows:

	Raids	No E/A	Cat I	Cat II
Week	74	75	35	7
To Date	1,556	3,059	388	167
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	2	0	0	0
To Date	100	83	0	2

For the same period, Ninth US Army reported 259 raids and 435 E/A, and First US Army showed 167 raids by 444 E/A.

2. GAF Tactics Notes

a. A tendency of E/A to hug the ground, even during night action, has been noted in recent days. This probably is in furtherance of attempts to escape giving early warning thru radar sources and to hinder engagement by 90mm guns and has, to some extent, been successful in terrain favorable to such tactics, such as country of long, winding valleys affording masked lanes of approach.

b. "Window" has, with increasing frequency, been reported in the area, as would be expected. No difficulties in radar tracking have occurred.

c. Flares were frequently reported, but only infrequently preceding an attack, as most concern evidently was for photo reconnaissance, rather than harassment.

3. Miscellaneous Notes

a. During the recent period of heavy rains, a large number of targets frequently detected by gun radars were picked up [illegible] Gun Bn. Once identified, they are easily distinguished [illegible] to the data already known concerning these phenomena, [illegible] Bn submitted the following findings made in the SAAR-

(1) Signal was weak and at times would disappear in the range scope. This occurred at about ranges as close as 4,000 yds.

(2) The speed was determined, in most cases, to approximate 40 miles per hour.

(3) The targets proceeded in all directions, though the majority moved south or west.

(4) Altitudes varied from 300 yds to 4,000 yds. The large majority, however, were from 300 - 600 yds.

(5) The following meteorological conditions prevailed on two occasions:

30536	4391706	30536	4570924
0390406	5401706	0830406	5690924
1300406	6411905	1810806	6690924
2350906	7441905	2871306	7691306
3381906	8200	3301106	7691306
			1820

(6) Gun batteries could locate these targets by relocation as they were broadcast over the unit AAARS.

(7) It was noted that on all nights the phenomenon occurred, air density was extremely high, being as much as 5% - 6% above normal.

(8) Normal targets may be tracked without confusion.

b. In shooting, unusual not only for exceptional results but also because all engagements were with unseen targets (all firing data being furnished by radars and M9 directors), the 120th AAA Gun Bn claimed 4 Cat I's and 1 Cat II out of 9 E/A engaged during a 45 minute period in the THIONVILLE IAF, one night this week.

c. Hitting power of the 90mm gun used in a ground role is amply shown by examination of fortifications and positions against which it was used. A FW recently taken from one of these stated that the 350mm steel doors on a medium sized bunker (20 man bunker complement) was completely pierced by 90mm shells. He had been informed of the caliber weapon used against them by a US officer present at the time of his capture, who was aware of the employment. Concrete walls of 1.50m to 2.00m thickness were damaged, but not pierced, by the 90mm fire. (Source: Third US Army, G-2 Periodic Report No. 188).

3 January 1945

AAA WEEKLY INTELLIGENCE REPORT NO 22

Period:
0806OOA to 250600A

1. Summary of Action

a. As the regrouped Third US Army started its attack on the southern flank of the enemy salient the Germans unleashed the striking power of their air forces, hitherto so closely husbanded. 751 enemy airplanes were counted during the week in a series of 493 raids over the Army zone. Largest number of E/A reported for any single day was 214, for the period 26-27 December. Most attacks were made against lines of communication, supply routes and installations. Traffic passing along main roads, and particularly at points of congestion - such as in the vicinity of the bridge at DIEKIRCH and the road nets surrounding and in-

DECLASSIFIED

Digitized by Google

side of BRENY, PONT-A-MOUSSON, COMPLAIN, METZ, THIONVILLE and ARLON - one attacked time and time again. Ammunition dumps at SIVRY and MERSH-IN-BOSNY were bombed and strafed, supply dumps (particularly Class III) were attacked with a loss at one, vic HALDENVILLE, of 100,000 gallons of gasoline, 3,000 jerricans and 8 bunkers. Likewise attacked were railroads and railheads at COMPLAIN, SEDAN and FLORANGE. Attacks upon Field Artillery were numerous and AAA units also were subjected to several attacks. In addition, bombing and strafing attacks upon airfields continued, some 20 being made in all. Other than the loss of gasoline, not much damage was caused by these efforts, and personnel casualties were inconsiderable. Jet-propelled A/C attempted to bomb a division CP from low altitudes, with no success. Reconnaissance flights were numerous and covered the entire Army area, night and day.

b. 3 Me262 were sighted and one was hit and caused to crash. All others passed over the area.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	Me109	Fw 190	Ju 87	Ju 88
Week	4,93	751	83	56
To Date	2,049	4,790	491	823

	Me 410 & Ju 188	Me 262	HS 129	Do 217
Week	85	3	0	1
To Date	193	26	0	5

2. GAF Tactics Notes

a. With the weather clear and bright sun prevailing this week, much use was made of the sun's blinding effect and many attacks, both bombing and strafing, were made with the sun behind the attacking aircraft.

b. Noticed again was the continuing tendency of E/A to attack from very low altitudes. However, this was far from being an exclusive tactic and in many instances bombs were released from medium and even from high altitudes. Whenever engaged from the ground by AAA, few bombing runs were completed and, in most cases, bombs were apparently released haphazardly with the pilot more intent upon escape than upon accurate bombing, as the results achieved show.

c. Some AAA Gun Battalions have cited increasing instances of German A/C, (which ordinarily take continuous evasionce tactics in flying across LOCs), flying a straight-line course at altitudes only a thousand feet over IAS top limits. This has led to their conclusion that German pilots, well aware of the restrictions imposed on AAA gun fire, feel secure in flying at slightly above the IAS ceilings.

d. In an attack upon artillery and other targets, a flight of 75 E/A of mixed types approached at noontime at an altitude of 18,000-20,000 ft. When over the target area, they broke formation and approximately 30 of them, in groups of two, began a circling descent to 3,000-4,000 ft, from which altitude they began a dive-bomb and strafing attack lasting some time.

e. E/A were overhead at all hours, both day and night, so that no time seemed to be preferred for attack or reconnaissance.

f. In an attack upon targets in HERSTHALTRAU, 7 Jet-propelled Me-262's attacked at elevation from altitudes of 300 - 5,000 ft. These A/C first bombed at the end of a long, shallow dive and then came low to strafe targets of opportunity.

3. Miscellaneous Notes

For a period of 14 days, from 4 December to 18 December, the 574th AAA AW Bn (M) furnished antiaircraft protection to the bridge crossing the SAAR River into SAARLAUTERN. The bridge had been captured intact on 5 December by elements of the 95th Inf Div, the vital AAA protection given to this vital crossing. Battery "A" was assigned the mission and at 0930, 14 December, the 1st platoon was given March Order, to proceed to an assembly point, vic GERSWEILER, GERMANY, preparatory to occupying positions in defense of the bridge.

A Recn party went forward to select gun sites and upon arrival at SAARLAUTERN found the town to be under intense enemy small arms, sniper and artillery fire. The S-3 of the 379th Inf Regt suggested not bringing in AAA at this time because of the uncertainty of a counter-attack. However, it was decided to continue as planned and the Recn party completed the selection of positions on foot.

The guns were brought up and while Sec #4 was building revetments, a heavy concentration of enemy artillery fire forced members of the crew to take cover. Shortly thereafter, enemy MG fire harassed the position and an NCO, who had elected to remain at his M-51, fired 200 rds .50 Cal ammo from his exposed position, silencing the enemy MG nest. In order to emplace the M-51 at Sec #2, it was necessary to build a revetment and then back the M-51 into position. An NCO, with assistance, built three sides of the revetment while lying on his side, then backed the mount into position, disconnected the trunk, and completed the revetment. Sniper fire originating from a church steeple located about 150 yds from the gun section, forced members of Sec #3 to take cover on several occasions. Bazooka fire was ordered on the steeple and an NCO fired 9 rds of bazooka ammo from an exposed position in the middle of the street. Later on, at the request of an Inf lieutenant, 21 rds 1/2cm AP ammo were fired into the tower and sniper fire from this source ceased.

About 1800 hrs, 6 Dec, "A" Btry Commander was directed to move two gun sections across the river. Accompanied by the Bd Platoon Commander, he made a reconnaissance on foot and selected the two gun sites. Gun sections #3 and #4 moved across the bridge and occupied positions under heavy artillery fire. Wire communications were established between the battery and all gun sections.

During the first 36 hrs that the platoon occupied positions, all gun sections were under extremely heavy enemy artillery fire, averaging 200 rds per hour. After that time and until 0400, 18 Dec, at which time the Bn was relieved of this mission, approximately 31,050 rds of enemy artillery landed in the bridge area.

During the period of the defense of the SAARLAUTERN bridge a director, a power plant, a truck and an M-51 quadruple machine gun mount were destroyed by enemy artillery fire. In addition to the loss of 10,835 rds .50 Cal ammo and some 1/2cm ammo. The M-51 was destroyed by two direct hits at 0050, 4 Dec 44. No casualties were suffered and the gun was replaced on the morning of 5 Dec 44. The position was changed and the M-51 was emplaced in an open casemate which was blown by the engineers. Other equipment, including 4 trucks and one M-51, was also damaged by artillery. Personnel casualties were 1 KIA killed, and many wounded.

The period was highlighted by individual achievements and acts of heroism, for which 2 officers and 6 enlisted men received Silver Stars, 4 officers and 14 enlisted men received Bronze Stars, and 14 men were awarded Purple Hearts for wounds received.

AAA WEEKLY INTELLIGENCE REPORT NO 83

Period:
0600A, 29 Dec 44 to 0600A, 05 Jan 45

1. Summary of Action

a. Continuing the pace of the previous week for the first five days of the present one, the inclement was ever in force until had weather grounded its chips. Flying more day than night sorties, it struck savagely at ground targets and - except in one instance - failed in material success. The scale of attacks reached its peak New Year's Day and night, when 343 hostile aircraft were reported in raids approaching but never quite equalling the air attacks on this Army in NORMANDY. Targets most frequently attacked were highway targets vehicles and field Artillery, with a lessening in number of attacks upon supply installations. Highways from METZ to LUXEMBOURG were strafed by jagglas of up to 20 A/C, and vehicles and bridges were strafed or bombed in and near PONT-A-MOUSSON, METZ, THIONVILLE, MONTMEDY, SEDAN, ARLON, BASTOGNE, MARTELANGE, TRENTANGE, ASSDORF, LOMENY, METZERE, FLORENVILLE and other cities and villages. An Ordnance dump vic BOULAY was strafed and bombed; railheads and railroad installations at SEDAN MANCHERULLES, TOUL, ESCH and LATOUR, Class I or III dumps at SIVRY and ARLON, and parked vehicles and tanks at various places, including RAMSBROUCH, all were attacked. Artillery was frequently attacked and in XX Corps zone, flights as large as 50 E/A fired machine guns, rockets and cannon at gun sites. 57 E/A attacked BASTOGNE on New Year's night. The damage from all these attacks was slight in comparison with the scale of the effort. A few vehicles were damaged and some personnel casualties were caused. An attack on the airfield near METZ, however, had more success though at great cost to the enemy. There, E/A bounced the field to strafe and destroy 20 closely-parked P-47's and damage 17 others. Of the 175 E/A attacking, 16 were shot down by AAA in the METZ area defense, and another was probably destroyed. Many other E/A covered the army zone on reconnaissance and there were few AAA units that did not sight and engage some hostile A/C.

b. 146 Me 262 were sighted over the area, of which 4 were engaged without result. One crashed in an open field, causing no damage.

c. Totals for the week, and to date from 1 August 1944 (corrected) are as follows:

	Me109	Fw 190	Ju 87	Ju 88
Week	334	647	86	38
To Date	2,382	5,487	436	859

	Me 410 & Ju 188	Me 262	HS 129	Do 217
Week	46	4	0	0
To Date	178	30	0	5

Ammunition expenditures on AAA firing for the week (shoot and test fire expenditures included) are as follows:

20mm	40mm	37mm	.50 Cal
3,014	7,441	3,855	841,533

2. GAF Tactics Notes

a. In attacking METZ airfield at 0520 New Year's morning, the German aircraft approached from the North at altitudes ranging from 1,500 ft down aboard to ground level, and speeds of 250 - 300 mph. Over the field, they split into elements of three which circled the field to attack from the four points of the compass and, as the attack progressed, these split up and the planes attacked individually. These still flying then departed to the North, hedge-hopping and strafing MOSELLE River bridges on the way out.

b. Dive-bombing was a tactic more frequently employed than heretofore, though other approaches were used, as well. The A/C frequent ly attacked from out of the sun. Accuracy was rather poor, however. Near RAMSBROUCH a plane attempted to bomb vehicles dispersed in an open field but, instead, hit a church, demolishing it.

c. Strafing often was done from extremely low altitudes and in attacking Field Artillery, strafing with machine gun and cannon and rocket-firing were almost exclusively the methods used.

d. A jet-propelled Me-163 was engaged vic XII Corps Artillery while cruising at 250 mph. In avoidance of AAA fire, it was reported to have accelerated to approximately 500 mph in a short space of time.

e. The AAA Gun Battalion in SAARLAUTERN IAS reported that E/A passing through, upon one occasion dropped "Window" in such large quantities that radars could not stay on target, nor could the targets be carried thru on remote.

f. Increasing efforts to create momentary confusion among AAA gun crews by the dropping of flares has been noted. Various colors and combinations of flares have been dropped, but there is no reason to believe recognition codes have been compromised.

g. In one strafing attack upon Field Artillery by approximately 15 E/A, the bulk of the planes created a diversion on one side of the area to allow a single Me-109 sneak in from the other side and strafe.

Digitized by Google

a. Many of the battalion engagements these past two weeks have been outstanding. On 26 December, a total of 36 E/A attacked the artillery with the 26th Inf Div and a division bridge crossing of La SURE River. The 590th AAA AW Bn, a self-propelled unit, engaged 25 of these, claiming 15 Cat Is and 3 Cat IIs. The attacking A/C came in at speeds of 250 to 300 mph, and at altitudes of [illegible] feet. Although almost all Cat Is claimed crashed within [illegible] of the firing units, they vary the pattern, 2 gun sections protecting the bridge from A/C, bearing shooting down several A/C, lowered their [illegible] that took effect vation, machine gun and sniper positions across the river, according for 15 enemy casualties and materially assisting the advance of the infantry.

b. Located well within artillery range and taking an occasional pounding, the 217th AAA Gun Bn is in BASTOGNE, where it has been almost constantly firing throughout several nights, using both 90mm and .50 cal weapons. On the night of 1 January, it had 57 engagements between 1825 and 0600 hours, with most activity concentrated between 2200 - 0100 hrs. The E/A came in singly and in pairs at altitudes averaging 4,500 ft, but on occasion as low as 900 ft. Radars performed well despite liberal dropping of "window". Target pick-ups were made at 900 ft altitudes twice. It was shot down on the second run-up and crashed 200 yds from the gun position which engaged it. After crashing, the pilot seemed still full of fight and was shot by nearby FA personnel after he exhibited considerable hostility. Another plane crashed when .50 cal hits caused the motor to conk out. The pilot, illiterate, was apparently unhurt. Quitting his ship he started a dash for the woods, but was delayed when 2 rounds of 40mm tracer were fired across his bow, and he thought it better to sit down and wait for his captors to catch up with him. Following this, 2 more Me-109s, curious about their fellow A/C, flew low to inspect the crash and were both shot down and crashed nearby. The 465th AAA AW Bn feels it was a lovely day. In all the 112th AAA Gp reported 33 Cat Is and 12 Cat IIs for activities during the day by the AAA units within XX Corps zone.

d. Preliminary to the action at METZ airfield, units under control of the 24th AAA Gp (30th AAA Brig) had established a defense for all METZ, including the airfield. The CO, 411th AAA Gun Bn, was designated area defense commander and for his defenses had 4 batteries of guns, 1 battery of the 466th AAA AW Bn (SP) and 2 batteries of the 386th AAA AW Bn (SP), attached to Third US Army for operational control from the 51st AAA Brigade (the ADC Brigade supporting XIX TAC). Only the 386th AAA Bn was in direct defense of the airfield, alone, and its first engagements with enemy aircraft gave it 8 Cat Is from the 15 targets it engaged. Batteries of the 411th Gun Bn used .50 cal fire exclusively, with the exception of one course fired by its 90mms, by gunner 7 Cat Is, and the 466th Self-propelled Bn, firing at the flight only as it approached and departed to the North, got a Cat I and Cat II. Several of the hit E/A crashed on the field, or blew up over it, spraying parts for many yards around. Most of the other carcasses already have been found.

e. Battalions bothered by frozen solenoids in the present cold weather conditions have shown ingenuity in solving the problem. The 796th AAA AW Bn, a self-propelled unit, attaches a small hose to the exhaust of the turret generator motor and heats the solenoids with the hot exhaust gasses. The 547th AAA AW Bn (M) has found that turning on the firing switch let enough current pass thru the solenoids on M-51 mounts to warm them in 3 - 4 minutes. Machine gunners are instructed to open the top cover, point the guns to a safe field of fire, and turn on the firing switch, taking care that the trigger is not released.

f. The 635th AAA AW Bn (M) is experimenting with a method of conducting unseen ground fire by 40mm guns. Range and azimuth drums have been made by calibrating 90mm shell cases and fitting them to elevating and traversing mechanisms of a 40mm towed mount. Test firing to determine accuracy and practicability of the method is being conducted.

g. Under certain conditions, tracer ammunition has been used by M-51 and half-track mounts when employed in ground support roles. Ordinarily, this involves the hazard of drawing mortar and artillery fire as the source of fire, even when deflected, is soon discovered. When used, however, tracers have proved of considerable value in bolstering morale of our own troops, who delight in the readily apparent spray of fire, and are sure of its direction. Now, from PW sources, comes a statement from the enemy.

"The defenders of BASTOGNE, in repulsing the attack of 3 PG Div in the early morning hours of 30 Dec, did so partly by a lavish expenditure of tracer bullets. All PW ascribe to them a considerable part in lowering morale. The lighting effect of the tracers made every soldier feel that he could not possibly go any farther without being spotted immediately. Secondly, the certain feeling that every tracer bullet comes straight onto the man, immobilized many of the enemy, especially inexperienced young Replacements, through sheer fear. Even such enemy personnel as had already some five years of warfare to its credit, men that have gone through the STALINGRAD battle, commented on the frightening display of fireworks ("Feuerzauber"), more intense than anything they had previously experienced." AAA WEEKLY INTELLIGENCE REPORT NO. 24

Period:
050600A to 120600A

1. SUMMARY OF ACTION

a. Clouds, snow and haze halted most air activity during the week. In Third US Army area, a total of 4 raids by 5 enemy aircraft were observed in efforts which, following upon the heavy raids of the previous two weeks, were anticlimatic. 2 single E/A which made no attacks were observed near BASTOGNE, and a flight of 2 other E/A attempted to strafe and bomb a weak force in the same general area. One E/A flew over LUXEMBOURG, apparently on reconnaissance. All 5 A/C were detected during hours of darkness. Other A/C, believed to be hostile, were detected by radars. AAA engaged 3 of the 5 reported E/A, making no claims.

b. 6 pilotless aircraft were observed over the area, 3 of them crashing without causing any reported damage. All but one of these were observed during hours of darkness.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	4	5	0	0
To Date	2,396	5,432	516	259
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	6	0	0	0
To Date	176	30	0	3

2. GAF TACTICS NOTED

No new tactics were reported.

3. MISCELLANEOUS NOTES

a. The Air PW interrogation unit with Ninth Air Force has furnished information of considerable value and interest, recently obtained from German Air crewmen shot down by our AAA. In particular, a Ju-88 pilot criticized our light AAA by saying it often opens fire with tracer at such long ranges that it was frequently possible for a pilot to locate the firing section and swing out around it in a circle, then never coming into really effective AAA range.

b. Of encouraging nature is information from the gunner of an Me-110, shot down by AAA near SAARBURG just after midnight, 27 December. He stated that the turn-over in his unit, in both flying personnel and aircraft, was very heavy due to the toll of our AAA. One Me-110 had returned to base, a week before his capture, with 84 medium caliber perforations in wings and fuselage.

AAA WEEKLY INTELLIGENCE REPORT NO. 25

Period:
120600A to 190600A

1. SUMMARY OF ACTION

a. Clearing skies allowed a slightly increased air effort this week, and raids by a total of 27 A/C were reported. While some flights were flown for reconnaissance, the majority of aircraft made attacks upon ground targets. Field Artillery received most of these, some 16 strafing and bombing attacks by a total of 34 A/C being made. Vehicles, and troops along highways were frequently strafed and bombed, notably via LAUBSFELD, ST MARGUERITE, EVERNDORF, NOTHUM, HAISTROFF, FELS and BOURSCHEID, and AAA positions were twice included as targets. Few attacks were apparently preplanned. Targets of opportunity were the main objectives as no supply installations, large communications centers, bridges or like targets were attacked. Some casualties were reported although the total number wounded or killed was small, and several vehicles were damaged. On the whole, missions seemed intended to harass, rather than to disrupt or seriously impede our ground efforts. Instances of reconnaissance were scarce, although flares were dropped 11 miles East of THIONVILLE, apparently for photographic purposes.

b. 8 PAC, both V-1 and V-2, were observed over Third US Army area, 2 of which crashed without doing any reported damage. One of these was reported as a V-2, but the report is unconfirmed at this date.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	27	87	3	9
To Date	2,423	5,519	519	268

2. GAF TACTICS NOTES

No new tactics were noted. A/C attacked out of the sun when possible. Upon occasion, attacks came from several directions simultaneously, the attackers then climbing into the sun in avoidance of AA fire. A/C frequently dove to the attack at angles of 45°-60°, from altitudes of 1,000-2,000 ft, pulling out at very low altitudes.

3. MISCELLANEOUS NOTES

a. Summarizing the over-all story of recent German air activity on the western front, XIX TAC's A-2 has gathered interesting information in a small tract entitled "Thirty-one Days with the GAF in the West". Figures given include claims of both air and ground forces, made in beating the GAF to its knees.

"10. In summarizing the GAF activity on the Western Front during the period covered by this report (17 December 1944 to 16 January 1945), it may be said that:

a. The enemy flew an average of 275/300 sorties daily in the Western battle area.

b. Total claims of Allied units, as reported, are 1740 enemy aircraft destroyed, 208 probably destroyed, and 380 damaged.

c. The 1740 enemy aircraft reported as destroyed represents about 20% of the sorties flown.

"11. To appreciate the recuperative powers of the GAF, the following estimates on production of their single-engine fighters may be of interest:

a. The enemy single-engine fighter aircraft production for October 1944 is estimated to have been 850 Me-109s and 650 FW-190s.

b. It is believed that the total number of new Me 109s and FW-190s produced in November was about 50 less than in the previous month.

c. Estimates for December are not yet available, but indications lead to the belief that production during this month should at least equal that of November.

"12. The single-engine fighter strength of the German Air Force, based in Germany (not including fighter aircraft employed on the Russian front) 16 December 1944 to the 16th of January 1945 is estimated as follows:

Date	W GERMANY (8 of 11th)	E GERMANY (8 of 11th)	TOTAL
16 December	1350	650	2000
25 December	1250	550	1800
2 January	1000	575	1575
9 January	1095	425	1520
16 January	1000	450	1450

"13. Of the 1,000 enemy single-engine fighter aircraft on the Western Front, there are approximately 600 considered as operationally serviceable. Of the 600 serviceable aircraft, there are 250/275 within range of XIX TAC (and Third US Army) installations.

"15. d. With reinforcements from NE and SW GERMANY, the GAF is capable of doubling his single-engine fighter forces in range of the Third US Army.

e. Up to 150 night fighters may be employed on harassing attacks....

f. The enemy can make dive-bombing attacks, at night ....using formations of up to 50 aircraft (Ju-87s)."

b. The CO, XII Corps Artillery, has advised that fire by Battery C of the 119th AAA Gun Bn, used in a ground role for the period 16 - 21 December, was of considerable help, thickening the fires of artillery with the Corps and in at least one instance being instrumental in averting a threatened enemy tank attack. The battery fired 1,800 rds of 90mm ammo during the period.

c. The 2d platoon of the 390th AAA AW Bn's "B" Battery recently was called upon to fire a ground mission in support of infantry. The enemy was located in a wooded area bounded by two roads, between WILTZ and BOTHUM. A foot reconnaissance was made by the Platoon Commander as a result of which he decided to back his four half-tracks along the road up to the area, using fire from the tracks alternately so that continuous fire could be delivered. As a weapon moved forward, or completed fire and was pulled out, its movement was covered by fire from the other tracks. On a succeeding day the same mission was repeated, fire being delivered this time from the other road. Small arms fire from very close range was encountered, but armor on the tracks afforded good protection against it. Heavy mortar and artillery fire fell upon the road and nearby road junction soon after this second firing mission was completed, so the half-tracks were quickly moved out. Only one casualty, resulting from small arms fire, was suffered. Infantry which swept the area reported 30 enemy were killed and 16 wounded, mostly as result of the fire, and 20 PWs were taken from the area.

Firing could not be done from a distance as the surrounding area was wooded. The Battalion Commander recommended that half-tracks should not normally be used in a ground role which involved taking them into enemy-held territory not providing adequate cover. However, since in this instance a foot reconnaissance was made and there were no indications either of enemy tanks or TDs in the vicinity, it was concluded the employment was feasible and the results satisfactory.

d. From the 633d AAA AW Bn comes another report of ground firing by M-51 (quad .50 cal) mounts. Weather limited visibility to 50 yds, but this had been foreseen and aiming stakes had been emplaced for each mount, indicating the azimuth to the selected target. Range had been computed and elevation was set by gunners' quadrant using firing table data.

e. From the same battalion comes report of an unusual casualty. An 88mm shell struck a house and, without detonating, passed thru its foot thick wall, went across a room and thru another wall 4 inches thick, where it struck the ankle of soldier who was walking up some stairs. The shell continued thru the stairway and into another room where it struck another wall and finally exploded.

f. In the interests of improving air-ground recognition, a discussion had with Army's G-3 (Air) and a representative from Ninth Air Force brought out the fact that in relatively few cases are amber flares fired from the ground seen by pilots in the air. While realizing the difficulties and even hazards involved, it was suggested that every effort be made to fire the flares so that they burst somewhere ahead, along the line of the plane's line of flight. Other units in the area which observe such attacks should also fire flares, keeping in mind that a flare must be fired intelligently if it is to be seen by the pilot.

g. Also attached are airplane silhouettes which it is planned to make a regular addition to this publication.

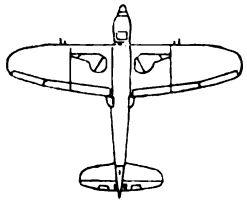
AIRCRAFT RECOGNITION



Tempest II

Tempest V

TEMPEST II is a RAF innovation with the Bristol "Centaurus" radial engine in place of the Napier-Sabre in-line engine. The same airframe is used, but despite the greater power developed by the Centaurus IV motor, Tempest II is inferior in performance because of increased drag. The Centaurus IV engine develops 2,400 hp at 5,000 ft alt, and gives Tempest II a maximum speed of over 465 mph at 19,000 ft alt. It has a wing span of 41 ft and is 34 ft long. Most notable difference between these two models is the absence of the bulging airscoop on the Tempest II.

The DOUGLAS C-74 is a new four-engined transport which is under development. It is an enlarged version of the C-54 and is fitted with four Pratt & Whitney "Double-Wasp" R-2550 engines.

AAA WEEKLY INTELLIGENCE REPORT NO. 26

Period:
190600A to 260600A

1. SUMMARY OF ACTION

a. The GAF, licking its wounds as a result of recent drubbings, bothered by bad weather, and undoubtedly called for duty more pressing on the Eastern front, this week set a record for inactivity over Third US Army zone. One raid by one, lone aircraft in the BASTOGNE area was all that was reported. It was a quiet week.

b. 11 PAC were reported over the area. One of these is reported to have crashed in a heavily wooded spot via LUXEMBOURG. No damage is believed to have been caused. All others passed without falling.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	1	1	0	0
To Date	2,402	5,520	519	868

	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	11	0	0	0
To Date	197	30	0	3

2. GAF TACTICS NOTES

No new German tactics were reported.

3. MISCELLANEOUS NOTES

a. Crews of 90mm guns will be happy to know that they no longer carry a simple thing like a 90mm gun but, instead, are T/O heirlers of a "Ratschbum". This is a nickname devised by the Germans for American 90's and expresses, according to PW recently interrogated, the sound made by the gun when fired at them as ground artillery. Rrrrratsch - bumi

b. German antiaircraft gun densities are usually much heavier than those of the Allies and the Allied Air Forces fly deep into Germany in large, massed formations. Nevertheless, figures of the Ninth Air Force for loss and damage caused by German flak are of considerable interest to Antiaircraft Artillerymen. (Source: 9th AF Int Sum No 114):

"FLAK, the most formidable foe of the Ninth's fighters and bombers....is the primary cause of loss and damage to (aircraft) of this command.

"During the period covered by this report (1 June - 30 Nov):

Bombers

(1) Flak caused 58% of all bomber losses.
(2) Enemy aircraft caused about 5% of all bomber losses.
(3) Flak caused about 97% of all bomber damage.
(4) Enemy aircraft caused about 3% of all bomber damage.

Fighter-Bombers

(1) Flak caused 53% of all fighter losses.
(2) Enemy aircraft caused 27% of all fighter losses.
(3) Flak caused 86% of all fighter damage.
(4) Enemy aircraft caused about 3% of all fighter damage.

"An analysis of bomber loss by type of mission shows that medium altitude visual bombing sustains the highest rate of loss, followed in order by blind bombing, and by miscellaneous, which includes window and leaflet dropping. When atmospheric conditions make blind bombing necessary, the Flak gunners must rely on non-visual methods of fire control, which are less accurate than visual methods.

"An analysis of fighter loss by type of mission shows that:

(1) Fighter bombing missions have by far the highest rate of loss. This results from the increased exposure to Flak incident to the low "dropping" altitude and the vulnerable "pull-out", well within the effective ceiling of light Flak fire. The rate of loss for this type mission has increased 60% during the last three months covered by this report, so it is particularly imperative that fighter pilots check constantly with their Intelligence Officers on the location of Flak, the best approach to particular targets, and the best evasive tactics to use.

(2) Escort missions have the smallest rate of loss. This is as it should be, what with the higher altitude and the fact that the aircraft being escorted would be the primary targets of the Flak defenses.

(3) Armed reconnaissance, area support, and fighter sweep missions are more than twice as hazardous as escort missions, but only about two-thirds as hazardous as bombing missions.

"In summary it is seen that in the case of both fighters and bombers Flak is responsible for almost all the damage and approximately half of the losses. Also it is seen that bomber losses due to enemy aircraft represent an almost negligible proportion of the total losses, and that enemy aircraft account for only about one-fifth of the combat losses of fighter planes."

c. Though no unit can be singled out to credit, the following happening may be of interest to those AAA units who participated in the BASTOGNE battle (Source: USSTAF Air Int Sum No 62):

"It sounds like a sequence from a Laurel and Hardy comedy, but the radio-operator of a Ju-88 night-fighter insists it's the reason he became a prisoner.

"The plane...was flying a standing patrol in the BASTOGNE area on 27 December, and the radio operator was minding his own business when American AA started popping at it. The pilot took violent evasive action, including a steep dive, which lifted the radio man from his seat and conked his head against the roof. Before he knew what was happening, the plane was pulling out of the dive and he was going in the opposite direction — so fast that he hit the floor, knocked open the escape hatch, and sailed right out into space.

"After that all he had to do was pull the ripcord and surrender to ground troops."

d. If doubt ever existed that the AAA units with the infantry face many of the hazards faced by the units they defend from air attack, the following announcement may suffice. The CO of the 377th AAA Au Bn (M), attached to the 4th Inf Div, has just received the 2d Oak Leaf Cluster to his Purple Heart, for wounds received in action in LUXEMBOURG 3 January 1945.

e. Below is a tabulation of the formal claims submitted and formal awards made to battalions for planes shot down while such units were attached to Third US Army. Awards by other armies are not tallied, therefore some units have more Categories credited to them than shown below.

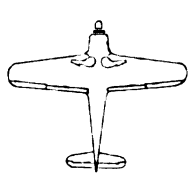
AIRCRAFT RECOGNITION



FOCKE-WULF 190-D

FOCKE-WULF 190

FOCKE-WULF 190 - Long the backbone of the German fighter forces, the F-W 190 has developed through many different series and sub-types to be one of the two most widely used enemy fighters. For the purposes of recognition, it can be broken down into two main types: the "D" series and the "A", "F", "C", "S", "F" and "G" series.

Series "D" is the "long nose" version. Two sub-types of this series are known, one powered by the DB 603 and the other by the Jumo 213 in-line engines. The latter motor is the more common. The fuselage has been lengthened behind the cockpit to compensate for the increased nose length. Over-all length of the aircraft has been increased by 2'-6". Although no performance details are available on the "D" series, it is believed to have capabilities at least equal to some of our best fighters.

The other series differ from each other mainly in internal characteristics such as tankage volume, radial engine types, armament, radios and armor. Of the "F" and "G" series only a few experimental models were built. The "F" series, an offshoot of the "A" series, is intended primarily for ground attack. For this purpose, extensive belly armor was added. The "S" series, another offshoot of the "A" series, is intended for use as a long-range fighter-bomber and reconnaissance aircraft.

AAA WEEKLY INTELLIGENCE REPORT NO. 27

Period:
260600A to 020600A

1. SUMMARY OF ACTION

a. One lone plane, venturing into BASTOGNE under cover of darkness, was the sole bit of GAF activity reported in Third US Army area. Once again, miserable flying weather and the urgencies of the Eastern front combined to restrict even normal intruder and reconnaissance missions.

b. Two PAC were observed. One crashed in a densely wooded area, but no damage was reported.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	1	1	0	0
To Date	2,465	5,521	519	268
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	2	0	0	0
To Date	199	30	0	3

2. GAF TACTICS NOTES

a. To obtain a variety of viewpoints on recent German air tactics, the S-2s of Army AAA Brigade and of separate AAA Groups were canvassed for comments and conclusions. Lack of space prevents printing these in full, so that extracts, only, appear below.

30th AAA Brigade, S-2

"...Generally speaking, units of this command have been assigned principal missions of defending bridges, supply installations, rails, roadways and airfields in that area bounded by corps rear boundaries and the Army rear boundary and have discovered that these areas are attacked from the air only when conditions in the GAF and the army are such that planes must be committed to attain an important or desperate end.

"...In periods of attack by Third Army forces the missions defended by our units have rarely been attacked, the main activity noted by the AAA protecting them being an occasional reconnaissance mission flown at medium or high altitudes. During this same period of quietude, however, reports from corps AAA units indicate much low-level strafing and bombing of front line troops concentrations and movement.

"On the opposite and unusual side of the picture there is the recent period of German ground offensive, in furtherance of which German air plunged wholeheartedly. During the most active part of this offensive the GAF treated corps and Army areas very similarly. Practically every type of defended area was struck at least once during the offensive, with dumps and convoys as the principal targets, the one exception being the airfield attack on 1 January, near METZ.

"During this period, Me-109s were engaged by Brigade units more than any other type, although a few FW-190s and Ju-88s were reported in the raiding parties on occasion. It was especially interesting to note that the new jet-propelled aircraft were conspicuous by their absence from the Army area during this period.

"...The present Russian offensive has without doubt affected the disposition of the German air force by drawing planes to the East, while sectional bombings by our strategic air force and overrunning of oil fields in the East has hurt the strength of the GAF by depriving it of its most vital supply, fuel.

"The loss of the initiative by the Germans on the West and their return to the defensive will surely result in a period of limited air activity in Army rear areas until Hitler becomes so desperate that he must commit the remainder of his air force to attack every target available to him no matter where it may be located."

106th AAA Group, S-2

(Since 22 October 1944, this Group has provided defense for the City of LUXEMBOURG, Radio Luxembourg, steel mills at DIFFERDANGE and airstrip 97. Until 17 December, air activity was light, consisting chiefly of reconnaissance missions. After that date, activity increased materially.)

"During the period of the German counter-offensive, the battalions attached to the Group engaged as many as 35 enemy flights, totaling 99 E/A in twenty four hours, and a total of 195 enemy flights in the 18 days...

"Seldom has the GAF sent multiplane flights over the area in the past three months, and in only three instances were as many as three enemy planes encountered in one flight. Further, during the entire period in LUXEMBOURG there have been but three 'seen' engagements...

"Some bombing and strafing was experienced while the GAF was operating in force, although there seemed to be no specific objectives for the attacks...On numerous occasions targets engaged by 90mm guns dove to very low altitudes and utilized deep valleys, masked from radar coverage, as routes of escape.

"German pilots employed a ruse not previously experienced by units of the 106th AAA Group. When entering the gun defended areas at low altitudes, colored flares were dropped as soon as automatic weapons opened fire. This undoubtedly was intended to confuse AAA Gunners momentarily, giving aircraft an opportunity to maneuver out of range of the weapons. When fire did not cease, flares of different colors often were dropped..."

27th AAA Group, S-2 (XII Corps)

"In studying GAF tactics (for the period 21 Dec to 1 Feb) two viewpoints were considered, namely that of AAA units in Divisional area and that of AAA units in Corps area...

"Divisional area. The GAF activity was limited to reconnaissance flights and attacks on Field Artillery positions. 75% of engagements were with E/A committing no hostile act and flying at 3,000 ft altitude. In each engagement E/A took evasive action and left the area. 25% of engagements were with E/A committing hostile acts upon Field Artillery and in each case upon being engaged the E/A left the area.

"Corps area. The GAF activity can be resolved into three categories: (1) Attacks on convoys and vehicle concentrations - 50%. (2) Reconnaissance flights - 40%. (3) Attacks on supply installations - 10%. Convoys were always attacked in the vicinity of traffic bottlenecks when vehicles tended to close up. Supply dumps attacked were in the vicinity of the Corps rear boundary. It is believed that there were no attacks on bridges only because there were no large bridges within the Corps.

"Conclusions:

(1) In Division areas the GAF was mainly concerned with reconnaissance.

(2) In Corps area the GAF was mainly concerned with vehicular traffic reported by reconnaissance flights.

(3) The GAF will not continue missions when accurate AAA fire is brought to bear upon them. In other words, 'They don't like it'."

324 AAA Group, S-2 (XII Corps)

"Most of the activity of the GAF during this period (3 December 1944 to 31 January 1945) was directed at harassing the front line troops and division trains. A few attacks were made upon rear installations in an apparent effort to knock out the railway and railroad underpass at ARLON.

"For the attacks on ARLON, the GAF used planes identified as Me-410s and Me-110s, bombing from low altitudes within range of AW fire. One attack made at ARLON during daylight hours took full advantage of low cloud cover to conceal approach and departure from target. In a strafing attack made on the ARLON-LUXEMBOURG road, the GAF used several SEP with one E/A making a strafing attack out of the sun while the others circled providing cover and then followed in a strafing dive after the preceding attacking E/A had regained altitude.

AAA
XX

Digitized by Google

DECLASSIFIED

"During this period there has been no report of any flights of heavy bombers over the III Corps area."

136th AAA Group, S-2 (XX Corps)

"...The Corps interrogation of several pilots points to the fact that the primary objectives of their effort (during the part of December) were grounded US aircraft.

"The E/A attacking front line troops would usually depart upon being engaged by AAA fire. However, on several occasions the GAF pressed the attack despite effective AAA fire...Divisional troops have reported that when E/A came in over the tree tops with cut motors; the sound resembles that of a Cub plane.

"...The attackers were obviously well informed on terrain, as they were able to fly at great speeds at a very low altitude. Numerous reports state that the attacks were made from 50 feet off the ground. This would indicate that the scattered sorties over the area earlier in the month had gathered sufficient information for a detailed study of terrain features as well as a general appreciation of various Field Artillery installations. It would also indicate that the Luftwaffe had considered an extremely low altitude attack advantageous inasmuch as AAA gunners would easily recognize the hazards of engaging below safe levels and perhaps experience some difficulty. In several instances, enemy planes approached along deep valleys and draws where Field Artillery positions were well defiladed. In many cases the tactical disposition of Antiaircraft defenses, well-sited for a 360° field of fire, precluded the possibility of engaging aircraft that took full advantage of terrain and flew low along these valleys and draws... In one instance during the attack on January 1st, the 537th AAA AW Bn had placed an M-51 mount on the same level as the well defiladed Field Artillery positions. This mount was responsible for the destruction of an Me-109, who undoubtedly was overcome with surprise in finding his avenue of approach fully covered...This incident suggests that although fields of fire would not be 360°, a small percentage of AAA fire power probably should be disposed on equal terrain levels with the Field Artillery to cover the approach of aircraft through the numerous valleys and draws peculiar to this zone of operations.

"Observers over the Corps front during recent action states noticeable leak of the usual evasive action by aircraft engaged by AAA. Perhaps the daring behavior of the Luftwaffe is beginning to far outdistance the experience of its pilots."

113th AAA Group, S-2 (VIII Corps)

"...the majority of air attacks (in our area) during December, 1944 were directed at railroads, marshalling yards, bridges and critical road junctions.

"During the period 010001A January 1945 to 050981 January 1945, a total of 55 raids were reported by AAA units attached to VIII Corps. Types could not be identified in 27 raids. Twin-engined E/A (Me-410s, Me-210s, Ju-88s and Ju-188s) made up 2/3 of the raids. In all instances they attacked singly and generally bombed or strafed from altitudes below 1,000 ft. Twin-engined types observed during daylight hours were in level flight, at altitudes from 2,000 to 7,000 ft and were apparently employed for reconnaissance as no attacks were made.

"No definite conclusions have been drawn from the enclosed summary of enemy air activity...Jet-propelled types as well as the 'old reliable' Me-109s and FW-190s were conspicuous by their absence.

217th AAA Gun Bn (M) - "On the night of 1 and 2 January...an very determined effort was made to get in the BASTOGNE area. Planes came in from all directions using no main approach, and at varying altitudes. Objectives seemed to be troop concentrations and gun positions rather than roads, bridges or other definite objective.

"On the same night, one German A/C came into the IAZ with landing lights on and caused a little confusion to machine gunners at first...

"Since the majority of engagements by this unit have been at maximum altitudes of 2,000 yds, it is believed that a close-in defense is the most desirable for the protection of a specified area. Unless the weather was clear with a bright moon, the enemy was never over in great strength.

"It has been the experience of this unit that, once heavy enemy air activity has ceased in an IAZ, the GAF makes no further attempts at heavy raids if 90mm AAA has been encountered. When heavy AAA is encountered by the GAF, no further effort is made to make a bomb run but, instead, they tend to jettison their bombs and take evasive action.

"Window is still employed by the GAF but it is not cut to our SCR 584 wave-length, nor is it used in sufficient quantities to disrupt tracking by radar.

"The first daylight attack this unit has ever experienced was at 0035, 2 January 1945 after a big night before."

"A" Battery, 695th AAA AW Bn (M) - "At 1803Z3A December, Guns #4 and #3...were attacked by one single-engine fighter strafing the positions from an altitude of 300 - 500 ft. The plane approached #4 Sector position from the West at about 250 mph and very low and attacked from a shallow dive...Plane then leveled off and continued on a straight line to attack #3 (M-51) position. Activity occured on a very dark night... However, pilot of the E/A apparently knew exactly where the two guns attacked were located...as he attacked on a direct extension of a straight line drawn between the positions."

537th AAA AW Bn (M) - "Following is a summary of observations of witnesses of GAF activity in the vicinity of WALDWISSE (WQ-125915) and OBERESCH (WQ-152895) at 0930 hrs, 1 January 1945:

"A number of Me-109s appeared simultaneously at very low altitudes, coming from several directions. The average height above the ground was less than 100 ft. These A/C flew down the valleys and barely skimmed over ridges in order to get down into the next valleys. One Me-109 at one point was reported coming up over a hill, flying about 5 ft from the ground. Because of these tactics, fire units could not engage targets because of the danger of firing into friendly troops and installations. From many positions the planes were below the horizon for almost entire courses. This shows the need for having some AAA weapons emplaced on lower levels down in the valleys, especially in the type of terrain where A/C can fly for some distance down a valley.

"The few two-motored enemy A/C seen recently flew generally on level flight just out of AAcm range or at higher altitudes.

"...A single FW-190 flew over a portion of our lines...apparently on a reconnaissance flight. When engaged the A/C dropped its landing wheels down and left a trail of black smoke. A few seconds later it was glimpsed again flying normally on a level course, with landing wheels up, and not smoking. The reason for this action could not be determined."

b. Below is a tabulation showing the number of actual attacks made against specified targets, and numbers of aircraft involved in making these attacks. By referring to figures previously given in earlier reports for enemy aircraft over the area, it will be seen that many enemy aircraft reported made no attack at all. Thus, for December, a total of 980 E/A were reported but, of these, only 412 were involved in attacks on ground targets. Percentages given are not figured on a basis of all aircraft observed during a month, but only on a basis of those aircraft making attacks.

	NOVEMBER		DECEMBER		JANUARY	
	Number attacks 15 Number E/A attacking - - 30		Number attacks 195 Number E/A attacking - 412		Number attacks 55 Number E/A attacking - 276	
TARGET	% Attacks	% E/A Attacking	% Attacks	% E/A Attacking	% Attacks	% E/A Attacking

	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%

c. In the next table is tabulated the activities of all E/A over Third US Army area, whether attacks were made or not, from the time this Headquarters became operational. These have been broken down to show two periods. During the first period, from 1 August 1944 to 15 December 1944, the German army may be considered to have been continually on the defensive. During the second period, enemy air activity was almost entirely for the purpose of supporting the German counter-offensive and is therefore shown as an offensive period. It will be seen by glancing at the bottom line of the tabulation that most air activity during both periods was for reconnaissance. In order not to be misleading however, it should be stated that the figures for reconnaissance also contains that percentage of E/A which passed over the person reporting and may have made an attack elsewhere, unknown to him, as well as those E/A which actually made an attack the target of which could not, by reason of terrain features, be seen by the observer.

	FIRST PERIOD DEFENSIVE (1 Aug - 15 Dec 1944)		SECOND PERIOD OFFENSIVE (16 Dec 44 - 1 Feb 45)	
	Percent of Attacks	Percent of E/A Attacking	Percent of Attacks	Percent of E/A Attacking
Airstrips	0.0	0.0	1.5	2.1
Ammo Dumps	0.3	0.8	0.7	0.3
AAA Positions	4.0	5.9	2.0	3.0
Armd Concentrations	0.2	0.1	0.1	0.2
Arty Observation Planes	0.5	0.4	0.0	0.0
Bridges	21.2	21.9	2.0	1.1
Cities	3.6	3.8	2.0	1.1
Command Posts	0.1	0.1	0.8	0.3
Convoys and M/T	11.3	16.2	2.7	3.3
Dams	2.3	1.7	0.0	0.0
Engr and Ord Depots	0.0	0.0	0.4	0.2
FA Positions	5.0	9.4	1.9	0.9
Gasoline Dumps	0.1	0.1	0.4	0.2

Troops and Concentrations	1.1	1.9	0.3	0.2
	54.3%	65.3%	14.5%	13.8%
Targets unknown or no attack made, and Recon Flights	47.3%	34.7%	85.5%	71.8%

d. In the following table column one gives altitudes and types of attack by percentages. The second column gives altitudes at which planes were observed which, however, made no attack so far as was known to the observer. (Covers only the months of November, December, January).

Type of Attack	1. Attack Made	2. No Attack Made
High Altitude (Bombing)	2.3%	.9%
Medium Altitude (Bombing)	3.0%	22.5%
Low Altitude (Bombing)	85.6%	71.6%
Dive Bombing	1.3%	
Strafing and rocket-firing	62.3%	
Unknown	6.3%	4.9%
	100.0%	100.0%

3. MISCELLANEOUS NOTES

a. As an interesting example of the coverage given by the FCC-AAOR (Fighter Control Center-Antiaircraft Operations Room), an occurrence on the night of 27/28 January is illuminating. At 0320 hrs the FCC-AAOR detected an aircraft flying South from LIEGE toward BASTOGNE. It was plotted to the BASTOGNE area and then followed as it turned around and went back North. At 0436 hrs, an aircraft was detected near METZ flying South. This was followed until the track faded. But Seventh US Army, to the South, picked it up and broadcast the plots until it passed out of the Seventh's sector, when the First French Army picked it up and carried the plot almost to the Swiss border. Thus, intelligence on hostile aircraft covered a distance of almost 300 miles, from LIEGE, BELGIUM, to SWITZERLAND.

b. For their outstanding performance in the defense of the airfield near METZ on the morning of 1 January, units concerned have been officially commended in General Orders No 23, this Headquarters, dated 25 January 1945, as follows:

"UNIT COMMENDATION - The following antiaircraft units are commended for their outstanding performance of duty:

Digitized by Google

Headquarters and Headquarters Battery, 441th Antiaircraft Artillery Gun Battalion

"H" Battery, 441th Antiaircraft Artillery Gun Battalion
"D" Battery, 441th Antiaircraft Artillery Gun Battalion
"A" Battery, 386th Antiaircraft Artillery Automatic Weapons Battalion
"C" Battery, 386th Antiaircraft Artillery Automatic Weapons Battalion
"B" Battery, 446th Antiaircraft Artillery Automatic Weapons Battalion (SP)

"On 1 January 1945, twenty five Me-109s struck an airfield near METZ, FRANCE. The enemy aircraft made four attacks on the field during a period of twenty minutes, strafing at ground level and diving from an altitude of approximately fifteen hundred feet. These attacks were met by the gun crews of the above units with typical American fortitude, each man displaying commendable bravery. Defending the field with rapidly developed and extremely effective fire, these units destroyed fourteen enemy aircraft and badly damaged four others. The heroic performance of these units is in keeping with the highest traditions of the service.

By command of Lieutenant General PATTON"

c. In the same general orders, the Meritorious Service Unit Plaque was awarded to 261st Ordnance Maintenance Company (AA) for services from 6 August 1944 to 15 December 1944.

d. Attached is a tabulation of "Batting Averages" of AAA units which have been operationally employed under Third US Army.

e. Also attached is the "Aircraft Recognition" manual, covering the models of the P-51.

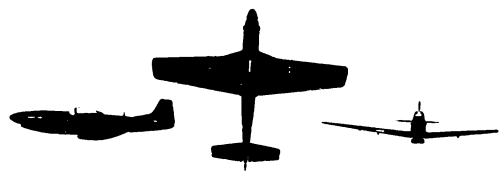
AIRCRAFT RECOGNITION



P-51A

P-51 B & C

The P-51 is probably the best single-engined fighter with an inline engine developed in the United States. First of a long line of these aircraft, the P-51A is powered by an Allison V-1710-81 engine developing 1000 HHP at 17,500 feet. It has a maximum speed of 375 mph at 20,000 feet and a Maximum Military Speed of 396 mph at the same altitude. Armament consists of two .50 caliber MG's mounted in each wing. Two 325 lb bombs can be carried externally.

With the advent of the B & C series, the Packard V-1650-3 engine was installed and power boosted to 1120 HHP at 20,500 feet. Increased power resulted in an increased speed of 405 mph at 20,000 feet. Using War Emergency Power, speed can be jumped to 440 mph. M.S.P. can only be used for a short period of time, but is sufficient for the pilot to get away from or to close in on an enemy aircraft. Armament remains the same as does bomb load.

P 51 D

The first major change in silhouette occurred with the D Series in which the usual canopy disappeared and was replaced by a new type canopy giving the pilot better vision and possibly longer life. The Packard engine is still used in this series although the model was changed to the V-1650-7 developing 1230 HHP at 17,000 feet. Maximum speed rose to 443 mph at 30,000 feet and if necessary the M.R.P. speed of 437 mph at 24,000 feet can be used for a short period of time. Armament jumped to three .50 caliber MG's in each wing while the bomb-load remained at two 325 pounders hung externally.

With the H series, maximum quoted speed has risen to 460 mph at 30,000 feet and the M.R.P. of the Packard V-1650-11 powering this ship is 2100 hp. HHP has not been given in recent publications available to this headquarters.

The K series, similar to the D series, is reported to have had a dorsal fairing added to the fin and rudder to increase stability and control. A larger fairing at the leading edge of the wing root has slightly increased the wing area.

12 February 1945

AAA WEEKLY INTELLIGENCE REPORT NO. 28

Period:
020600A to 050600A

1. SUMMARY OF ACTION

a. There were four enemy planes over Third US Army area this week, all during hours of darkness. Only one of these made an attack, strafing a jeep on the road at (PQ4164), near MOINET. The other A/C were observed via METZ, LUXEMBOURG and the 90th Inf Div CP, apparently on reconnaissance missions. AAA engaged two of the four, with no claims resulting.

b. Four FAC were over the area. One of these, a V-1, crashed but caused neither damage nor casualties.

c. Totals for the week, and to date from 1 August 1944, are given below. There will be noted a reduction over totals stated in last week's report. This results from the adoption of a new policy under which raids and planes will henceforth be filtered by Army to eliminate duplications. In accordance with this, past records have been checked and duplications in previous reports eliminated with the result that totals have been reduced. In reporting raids and numbers of aircraft all E/A, whether within range of AAA weapons or not, will, as in the past, be reported.

	RAIDS	NO. E/A	CAT I	CAT II
Week	4	4	0	0
To Date	1,569	3,666	511	252

	FAC OVER AREA	FAC ENGAGED	CAT A	CAT B
Week	4	0	0	0
To Date	205	30	0	3

2. GAF TACTICS NOTES

a. No new tactics were reported.

b. Interrogation of a Ju-88 pilot recently downed developed that the purpose of GAF night strafing and bombing is to cause convoys to black out, thus making them slow down, as much as for any other reason. Although small frag bombs and six 50-kilogram anti-personnel bombs were carried by the A/C it was not anticipated that raids of this type would cause much serious damage. (Source: USSTAF AIS No 64)

3. MISCELLANEOUS NOTES

a. The note in last week's report on the observed use by a FW 190 of the trick of dropping its wheels and emitting black smoke brings to mind the reminder that such tricks to simulate damage are common practice. FW-190s may easily create smoke by changing to a rich gas mixture and by using their emergency power. Gasoline, injected into the intake manifold after the supercharger as a coolant, will create smoke in burning. Me-190s have a somewhat similar system and in later models a cooling system using a water and alcohol injection produces the same results. AA gunners should not be fooled by this trick and where rapid acceleration accompanies the smoking should be wary of too trustfully making a claim for damaging the A/C.

b. Under General Orders No 31, this Headquarters, two AAA units were cited for their part in the battle around BASTOGNE, during which time they were under attachment to the 101st Airborne Division. These units are Battery "F", 796th AAA AW Bn (SP) and Battery "C", 482d AAA AW Bn (SP). The citation ran to the division and attached units as follows:

"These units distinguished themselves in combat against powerful and aggressive enemy forces during the period from 18 December to 27 December 1944, by extraordinary heroism and gallantry in defense of the key communications center of BASTOGNE, BELGIUM. Essential to a large-scale exploitation of his break-through into BELGIUM and northern LUXEMBOURG, the enemy attempted to seize BASTOGNE by attacking constantly and savagely with the best of his armor and infantry. Without benefit of prepared defenses, facing almost overwhelming odds and with very limited and fast-dwindling supplies, these units maintained a high combat morale and an impenetrable defense, despite extremely heavy bombing, intense artillery fire, and constant attacks from infantry and armor on all sides of their completely cut off and encircled position. This masterful and grimly-determined defense denied the enemy even momentary success in an operation for which he paid dearly in men, materiel, and eventually morale. The outstanding courage and resourcefullness and undaunted determination of this gallant force is in keeping with the highest traditions of the service.

By command of Lieutenant General PATTON:

c. Recently the 38th AAA Brigade has been fostering a series of aircraft recognition schools among the Groups under it. The 214th AAA Group has just finished giving such a course to 166 officers and enlisted men selected on a basis of 4 EM and 1 O per gun battery and 32 EM and 2 O per Automatic Weapons Battery. The duration of the course was two weeks, with the classes lasting 45 minutes each. A Bausher projector, flashing pictures on a screen for periods of 1 to 1/100th of a second, was used with good results. From test records kept it was found that the average recognition ability of the students increased 20%, while at the same time image exposure-time was reduced from 1 to $\frac{1}{2}$ second. As a special incentive Paris passes and monetary prizes were offered to the three EM scoring highest in the course.

d. Attached as inclosure No 1 is the aircraft recognition annex.

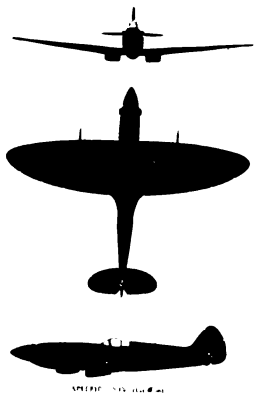
AIRCRAFT RECOGNITION

SPITFIRE V (Clipped) (Merlin)

SPITFIRE VB (Merlin)



SPITFIRE IX (Merlin)

SPITFIRE XII (Griffon)

DECLASSIFIED

Digitized by Google

SPITFIRE [illegible]

Having played a major part in the early stages of the war and still going strong, the Supermarine Spitfire is another of those aircraft which has undergone many changes since the beginning of the war. In general, this aircraft may be grouped by wing design into three types for purposes of recognition:

1. The normal elliptical wing type, used through the Battle of Britain, is fitted with several different models of Rolls Royce engines.

a. The Mark V has a Merlin 45 engine with single radiator under starboard wing.

b. Marks VIII and IX have a Merlin 61 engine with radiator under each wing.

c. The Mark XIV has a Griffon 65SM engine with a radiator under each wing.

2. The clipped wing was developed for high maneuverability at low altitude. This wing type is fitted with two different models of Rolls Royce engines.

a. Mark V (modified) has a Merlin 45 engine with single radiator under starboard wing.

b. Mark XII has a Griffon 11B engine with single radiator under starboard wing.

3. The pointed tip wing was developed for combat at high altitudes. In this type, a slight extension has been fitted to each wing tip in order to provide extra wing area and lift. This type (Mark VII with pressure cabin, and some Mark VIIIs) is always fitted with a Merlin 61 engine with a radiator under each wing.

The Spitfire is in the 400 MPH class. The Mark IX has a maximum speed of 406 MPH at 26,500 feet, the Mark XII, 397 MPH at 18,000 feet and the Mark XIV, 446 MPH at 25,400 feet. Usual armament consists of two 20mm guns and four .30 cal MG's in the wings. Although no performance data or silhouette of it is presently available, it is known that a Spitfire Mark XX is now in use. The maneuverability of the "Spit" can best be characterized in the words of an American fighter pilot who had finished a course at a RAF school. He called it "One of the sweetest ships I have ever flown."

Particular care must be exercised in recognizing this aircraft as it has often been confused with the ME-109 to which, when viewed in certain aspects, it bears a strong resemblance.

AAA WEEKLY INTELLIGENCE REPORT NO. 29

Period:
0900GMT to 1606GMT

1. SUMMARY OF ACTION

a. After several weeks of almost complete inactivity, the Luftwaffe aroused itself to the extent of making several small raids. 15 E/A were over the area during the week of which 10, bent upon reconnaissance, appeared in XII Corps zone the morning of 13 February. One of these is reported to have done some strafing of unknown targets in the 78th Inf Div sector. No attacks other than this one were reported. Other enemy planes were detected during night time flying through the THIONVILLE, LUXEMBOURG, DIEKIRCH-ECHTERNACH and ECH LAKE. One of these, flying across both LUXEMBOURG and DIEKIRCH, was shot down by AAA Guns in the latter area and when found proved to be a Ju-88 carrying supplies and considerable mail to the enemy garrison at LUXEMBOURG. Of the 15 E/A reported, 13 were engaged by AAA with results as shown below.

b. 3 PAC were spotted overhead, but all apparently passed over the area as no crashes were reported.

c. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	11	15	3	2
To Date	1,980	3,061	514	254

	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	3	0	0	0
To Date	206	30	0	3

2. GAF TACTICS NOTES

No new tactics were reported.

3. MISCELLANEOUS NOTES

a. AAA Automatic Weapons units continue to be employed in diversified roles. The 447th AAA AW Bn this week used both 40mm Bofors and .50 cal quad-mounted machine guns to support the advance of the 5th Inf Div. Missions were fired in conjunction with artillery concentrations, or separately, as called for. When visibility permitted, fire was adjusted by infantry forward observers. Pillboxes, road junctions and troop concentrations on hills and down in draws were targets. 40mm tracers also were fired to designate targets for the infantry and to guide them to the targets.

b. At the request of engineers, objects floating downstream and endangering bridges under construction near ECHTERNACH were fired upon and destroyed by firing sections of the 467th AAA AW Bn. Apparently the uses of AA units are endless.

c. During the past week or so, beginning in XII Corps zone the night of 4/5 February, AAA Searchlights have been used in XII and XX Corps sectors to furnish night illumination for the infantry in the form of artificial moonlight. The big, 800 million candlepower lights have been used almost nightly as weather permitted and, once accustomed to them, front line troops have found them to be of great help. Commands of troops and of AAA Group commanders are of particular interest.

d. In XII Corps, illumination was furnished to the 5th Inf Div in its attacks over the SAUER and OUR rivers in LUXEMBOURG. Lighting was also furnished to engineers engaged in bridge-building operations. The Commanding Officer of the 278th AAA Group (XII Corps) stated:

(1) The beam of light in the sky, aimed over their objectives, enabled the troops to keep their sense of direction.

(2) The resulting illumination made it possible for the troops to distinguish trees and obstacles in their path.

(3) The lights enhanced the morale of the troops by eliminating the feeling of "blundering in the dark". After the infantry learned to keep in the shadows produced by the illumination they felt they could see the enemy and not be seen themselves.

(4) During the river crossing of assault boats lights were doused after a ten minute trial as the boats were too strongly illuminated.

(5) When used to illuminate bridge sites for engineers, 5th Inf Division G-3 reported that it enabled them to do more than twice the amount of work, during hours of darkness, than had been possible under blackout conditions.

(6) A training period in a rear area is considered desirable so that the troops can become acquainted with the effect of the illumination and made to realize the amount of light provided. In all cases where the lights have been used, troops have expected more illumination than it is possible to obtain.

e. In XX Corps, lighting was furnished the 26th Inf Div for operations in the SAARLAUTERN bridgehead area. Since these operations were confined almost entirely to street and village combat, the effect of lights upon such activity is of especial interest. The Commanding Officer of the 112th AAA Group (XX Corps), quoting infantry sources, stated:

(1) The city is heavily booby-trapped and mined. It was German practice at night to withdraw from several houses, leaving them thoroughly trapped and mined, and then to reoccupy the following morning. This tactic made it difficult to enter the vacated houses without sustaining casualties, and difficult to take prisoners. However, in one period of three nights' operations with lights not a single casualty was suffered by American patrols, though 2 enemy were killed and 5 PWs taken. In addition, one regiment relieved another coming out of the line, the relief being greatly facilitated by the lights. Furthermore, no casualties were suffered in process.

(2) Combat patrols maintained better control over their members and better direction of movement.

(3) Mined and booby-trapped areas were easily skirted.

(4) Transportation of supplies to forward elements and other installations was considerably aided.

(5) Best results were obtained when patrols were sent out before artificial moonlight was turned on.

(6) Observation and adjustment of artillery and mortar fire was improved.

(7) Vehicular accidents were decreased.

(8) Observation of the enemy's avenues of approach was improved.

(9) Enemy patrols were observed and recognized before they got into our positions.

(10) Observation of enemy vehicles was improved and enabled them to be brought under artillery fire with greater success.

(11) A counterattack by approximately a company of infantry operating in a single city block was halted, facilitated considerably by the use of lights which enabled finer adjustment of artillery and mortar fires than normally.

(12) One disadvantage noted was that the lights favored the enemy when he was located inside buildings and entrenchments, as lights disclosed friendly troop movements to him.

(13) Generally, individuals could be identified at approximately 50 yards.

(14) Vehicles were identified from 100 to 150 yards.

Digitized by Google

(15) Vehicles and small bodies of troops were observed but not identified from 200 to 500 yards.

(16) Movements silhouetted by illumination were observed at 1,000 yards.

(17) Observation in a direct line between observer and the source of light was of greater range than 1,000 yards.

(18) After the first night of employment, the troops learned to keep well in the shadow cast by the lights.

f. Prisoner of War interrogation has revealed opinions at some divergence. For that reason, a cross-section of testimony is given below.

(1) Some PWs (266th Div Sector) claimed they liked the lights, as it facilitated their supply. In the matter of feeding, food brought up at night was not spilled, and they thereby got full rations. Food to them is a critical item. They said it also made eating more a pleasure as they could see what they were doing. Lights were further approved as it made our movements easier to detect.

(2) However, (269th Div Sector) lights also were disadvantageous as they caused their own movement to be observed with a result that their own patrol activity was greatly reduced, as was movement behind the lines.

(3) In XII Corps zone, PWs held to similar opinions, with some additions. The general consensus was that light fell on their positions with an intensity of about half moonlight. However, it was considerably brighter when there was snow on the ground.

(4) Neither officers nor men had ever seen any of our personnel silhouetted by the lights.

(5) All PWs interrogated wondered that their own artillery did not fire at the lights. They believed our lights were well-defiladed though one Pv stated he had received the beam directly in the eyes and been temporarily blinded. One PW, an artillery officer, stated that artillery did not shoot at the lights as they served as a warning of impending action and helped them as much as they did us. He could see no reason for destroying something that helped them and took no effort on their part to operate.

(6) A few PWs did not dare leave their slit trenches so long as the lights were on for fear of being observed. One SP even used the light as a beacon to which he walked to desert.

(7) All PWs were a little amused by the use of lights and felt their own people would never have thought of using them in such a manner. (Apparently they were unaware of the German use of some kind of searchlight North of BASTOGNE, in January)

g. Other PWs were interrogated as to the effect upon them of AAA Automatic Weapons fire, with the following results:

(1) The volume of infantry fire (from AAA M-4, Quadruple .50 cal mounts) was such that trench battle positions were useless in any day operation to gunners. Their own fire was limited to unaimed bursts in the general direction of our troops. PW officer prisoners stated that the heavy machine gun fire delivered in that direction made trouble impossible and inflicted heavy casualties on troops of the 106th Volks-grenadier Div caught in the open. (106th Inf Div Gen (1.Ma) reriously reports, 2nd Bn 422nd Inf, which did the fighting in support of the 14th Cav. Group)

(2) Other PW interrogated, (taken from XII Corps front) had all been in or near concrete bunkers. Four of six said the fire was too high, and they could easily walk around under it. They knew of only one man killed, and he was on his way, with another man, to take up a rifle position. The one escapee dropped flat and was able to crawl back to the bunker, though fire in this instance was only two feet off the ground. One in the bunker was slightly wounded when a s[illegible] a block of wood in one of the firing ap[illegible]

(3) One PW a veteran from the Russian front, said the Russians frequently used tracer fire. This veteran welcomed tracer fire because it could be seen and avoided, and once the source could be seen and dealt with. He stated that tracer fire had little or no effect upon morale of seasoned men, and thought the fire would be more effective if no tracer were used.

(4) Most PW apparently were unseasoned, since the voluminous tracer fire had considerable effect upon their morale. Those inside bunkers did not dare to come out; those caught outside said their morale was "crushed."

(5) None of the PWs interrogated had knowledge of the effect of fire on slit trenches or foxholes since, in cases known, fire had either been grazing or had entirely overshot the positions. However, one PW considered himself quite safe from grazing fire when lying in a trench about 16 inches deep, though he did not dare raise his head so long as the fire was going on.

h. The following commendation has been received by the CO, 155th AA AW Bn from the Commanding General, XX Corps:

"I desire to commend the 155th Antiaircraft Artillery Automatic Weapons Battalion for outstanding performance in action against the enemy on 1 January 1945. For 34 minutes during the morning of 1 January 1945, approximately 60 enemy aircraft relentlessly bombed and strafed the field artillery installations which your battalion was defending. High speed diving tactics were, in general, used by the enemy, and he frequently endeavored to distract the attention of the antiaircraft gunners by sending in one planes from a different direction. The lone planes would dive on or near the antiaircraft unit, thus hoping to reduce the effectiveness of the antiaircraft fire on the original target. The antiaircraft gunners remained cool and stood their ground, thereby warding off the enemy. When the encampments had ceased, it was found that neither the field artillery installations nor those of the antiaircraft had sustained any material damage, although subjected to devastating and continuous fire from the high speed enemy planes, none of the personnel of the ground installations were killed and only minor casualties resulted. As a result of the encampment, 10 enemy planes were destroyed, 5 were probably destroyed and 5 were damaged. The success of these few minutes of action is a tribute to the alertness, keenness and efficient manner of performance of the officers and men of your battalion. I desire to express not only my personal thanks to the officers, warrant officers and enlisted men of the 155th Antiaircraft Artillery Artillon, but those of the entire XX Corps for their splendid accomplishment and devotion to duty.

/s/ WALTON H. WALKER
Major General, United States Army
Commanding"

i. The 653d AAA AW Bn for the instruction, as well as amusement, of its personnel issues a weekly paper called the "Anti-Coast". This is a well-liked, two to four page sheet within use of the silhouettes of all concerned. Silhouettes are presented in test form, with answers printed the following week, and are enlivened by various cartoonal drawings. Anglo-American loosy-tongue and slang are dealt with, and current tips also are passed along. It is distributed down to every section.

j. Attached as an Inclosure is the weekly aircraft recognition annex.

/s/ F. P. Chamberlain, Jr.
/t/ F. P. CHAMBERLAIN, JR.

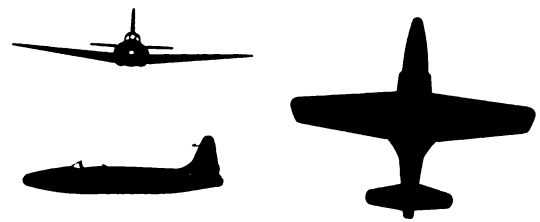
AIRCRAFT RECOGNITION

THIS JET PLANE needs no snarling faces painted on it for frightfulness. Frontal view suggests that P-80 in head-on attack if enemy pilot even see it will look like one of the flying monsters that haunted steaming prehistoric swamps.

The most recent addition to the American "jets", the P-80, is indeed a ship to fill any Americans with pride. It is the second American-built jet propelled aircraft released for publication, the first being the Bell "Aircomet", P-59A. The P-80 is manufactured by the Lockheed Aircraft Corporation.



Description: Single seat, single engine, low wing cantilever monoplane with single fin and rudder. The P-80 is equipped with a tricycle undercarriage and a fullview bubble canopy.

Dimensions: Span 39 feet, length 32 feet, weight 11,950 lbs.

Power Plant: One Halford General Electric 1A0-3 jet propulsion type, developing 3750 lbs. thrust.

Performance: Maximum speed of over 550 mph. Service ceiling over 40,000 feet.

Armament: 6 or more .50 caliber machine guns fixed in the nose.

P-38, B	Boeing	B-17F and B-17G
P-10	North American	B-25
P-13	Boeing	B-29

3. An Air Force officer who accompanied a Naval Task Force on a recent strike, reports that at Saipan naval aircraft encountered a Japanese jet-propelled aircraft. So far as can be ascertained, this makes the first appearance of such Japanese aircraft in a combat theater.

The aircraft appeared quite similar to German jet-propelled planes. Its speed was estimated at approximately 500 miles per hour. No other information is available at the present time.

4. The following outline of Status of British aircraft is based on informal reports and comments made in the U.S. Navy Semi-Monthly News Letter to Staff Recognition Officers:

SPITFIRE: The VIII, IX and XIV are the important models. Stress should be on the IX and XIV at present, and on the new XXII when this bubble canopy model appears.

TYPHOON: Still in use and considered important. Had a large past production. Will evidently be replaced by Tempest eventually.

TEMPEST: Tempest V is the mark of the present operational model. It closely resembles the Typhoon and Tempest II. It differs somewhat recognitionally from Tempest II and will probably be the more important of the two models.

MOSQUITO: High production expected to continue. Two important versions are the solid nose fighter-bomber and the attack bomber version with bulged bomb bay to accommodate a heavy bomb.

BUCKINGHAM: In limited production. Doubtful if it will become an important aircraft.

LANCASTER: Quantity production will continue. Important current model is the III. Lancaster IV with 320 feet span, scheduled to appear soon, will replace earlier versions.

HALIFAX: Halifax III is important current production model. The I is obsolete and II is unimportant. Halifax VII will appear later, with same recognition features as the III.

NOTE: It is considered that types not listed above are obsolescent or unlikely to be seen in the Third US Army area.

AAA WEEKLY INTELLIGENCE REPORT NO. 31

Period:
230600A Feb to 020600A Mar

1. SUMMARY OF ACTION

a. Small scale enemy air activity continued this week in Third US Army area. 14 E/A were reported of which 11 appeared in one day over VIII Corps area. The 3 other E/A flew singly and were reported on separate days, 2 in the LUXEMBOURG area and 1 reported by Friendly A/C who observed it over the XX Corps area. All but one of the planes flew at altitudes, with reconnaissance apparently their primary mission. One attack against ground targets was reported, as a single plane observed to strafe unknown targets via BASTOGNE (P-7576) with [illegible] type, if any, unknown. AAA engaged 10 of the 14 airplanes, and claimed probable destruction of 5 as a result.

b. Contrails of 16 PAC (V-2s) were observed over the area. No crashes were reported.

c. Totals for the week, and to date from 1 August 1944 (Corrected) are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	9	14	0	5
To Date	1,589	3,695	514	261
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	16	0	0	0
To Date	238	31	0	3

2. GAF TACTICS NOTES

a. No new tactics were noted.

b. Though the Luftwaffe apparently is not at present to be committed in strength on the Third US Army front, ground activity to the North is drawing considerable of its attention. Of particular interest is the increased proportion of jet-propelled A/C reported by Ninth US Army. Me-262s are the most commonly observed, though He-280s and Ar-234s have also appeared. These aircraft are flying in at altitudes low enough for engagement by automatic weapons fire, and AAA is taking full advantage of opportunities presented to score many claims.

3. MISCELLANEOUS NOTES

a. The 390th AAA AW Bn (SP), on 25 and 26 February, conducted practice firing at ground targets for crews of all M15 and M16 halftracks. The targets were set up at a range of from 600 to 1,400 yds. The purpose of the practice was to demonstrate the problems involved in firing at ground targets at various ranges. Special attention was given to the amount of elevation required in order to deliver accurate fire with the first few rounds at targets at the various ranges, and to emphasize the need for accurate boresighting. As a result of the firing it was found that more accurate fire could be delivered on ground targets with the M15, both initially and for sustained firing. Also, neither the M6 nor the Mk 9 sight is adequate for accurate ground fire".

b. The 119th AAA Gun Bn, finding itself in a proper situation for such employment, recently sited its spare radar in a location for the detection of ground targets moving along roads behind the German lines during darkness. B and D Batteries were given a secondary mission of engaging such targets, their fire being controlled from an FDC at the radar, with communication to the Field Artillery for the securing of necessary clearances. Quite a few vehicles were spotted and engaged, with the result that traffic was stopped in every instance. Actual damage done is unknown, but German nerves must have been severely strained, upon several occasions.

c. Battery A, 482d AAA AW Bn (SP), recently received a unit citation under General Orders 44, this Headquarters, for its part in smashing the German breakthrough effort of December. The citation reads as follows: "During this period (from 17 December - 26 December 1944) Battery "A" was assigned the mission of furnishing ground support to infantry, artillery, and tank destroyer units defending positions against the strong enemy thrust into Belgium and Luxembourg. Facing overwhelming odds with outstanding heroism the Battery fought stubbornly over difficult terrain, inflicting heavy losses upon the enemy. At one time this unit held a sector alone, without immediate support of other arms. The indomitable fighting spirit, the courage and devotion to duty of the officers and men of this Battery are in keeping with the highest traditions of the military service."

d. Attached as an inclosure is the Weekly Aircraft Recognition manual.

Types of Ju-88s most frequently encountered on the Western Front are the "C" and "R" series. The Ju-188 is a development of the "A", "P" and "D" series and probably represents a transition type between the Ju-88 and Ju-188. This latter plane was intended gradually to replace the widely-used Ju-88 as the GAF's all-purpose aircraft. Marked similarities make it difficult to distinguish types, but close study of the silhouettes below will unocver points of distinction.

AAA WEEKLY INTELLIGENCE REPORT NO. 34

Period:
160600A to 230600A

1. SUMMARY OF ACTION

a. It was no wonder that Third US Army's advance in the PALATINATE triangle during the past week drew the full, frantic attention of the German Air Forces. With the enemy facing a catastrophic envelopment of all his forces and defensive positions he threw a considerable number of the aircraft available on this front into attempts to slow our drives. Hostile air activity began moderately with attacks on the spearheads of XII Corps' 4th Armd Div. But when the MAHE River was reached and crossed, it increased considerably and remained at a comparatively high level throughout the week, with few exceptions. Artillery and installations supporting and aiding the advance received much attention, and bridges over the MAHE River at HETTENHEIM, BAD MUNSTER and OBERHAUSEN and over the MOSELLE River at HATTENPORT were bombed and strafed. XX Corps' advance along the South flank which rolled up the SIEGFRIED Line and destroyed the entire German static positions drew equal attention the last two days of the period. Traffic on the Autobahn Highway N of KAISERLAUTERN was attacked, as were other targets of opportunity. Elements of divisions under both corps received many attacks. Jet-propelled planes were numerous for the first time in Third US Army area, as both Me-262s and Ar-234s made frequent appearances in [illegible] the intensity of the air attacks, damage [illegible]

DECLASSIFIED

were hit, casualties were few. Most attacks were by daylight with no preference shown for a particular hour, as attacks came throughout the day. A considerable number of these attacks were from altitudes well above the effective range of AAA automatic weapons. However, enough E/A flew at low altitudes to give Antiaircraft gunners a good workout. 72 Cat Is and 45 Cat IIs were chalked up, 51 Cat Is and 40 Cat IIs of these being claimed by XII Corps AAA units, the remainder by XX Corps. In addition, many E/A were claimed to be damaged (Cat III).

b. Reports have not been completely screened for duplications, so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	122	475	72	45
To Date	1,729	4,190	589	307
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	3

2. GAF TACTICS NOTES

No new tactics were noted. Formations sighted varied in size from lone A/C up to groups of 25. Jet-propelled A/C pursued no noteworthy tactics and sometimes flew in mixed formations with standard types so that their special capabilities were, perhaps, thereby somewhat restricted.

3. MISCELLANEOUS NOTES

a. Many of the actions by AAA units this week are deserving of mention. Of particular interest, however, is the report of the 489th AAA AW Bn (SP) which supported the 4th Armd Div's swift advances. Numerous bombing, strafing and rocket attacks were made on elements of the division, its installations and bridges it captured intact, and on the AAA gun sections protecting them. For the most part, E/A involved were Me-109s and FW-190s, with a sprinkling of Me-262s and Ju-188s. Making the most of St Patrick's Day the 489th SP, known as "Murphy's Marauders", engaged 39 of the E/A attacking and claimed 12 Cat Is and 8 Cat IIs. In the three day period from 17 to 20 March, a total of 103 of the E/A attempting to thwart the advance were engaged, of which 25 were claimed destroyed and 19 probably destroyed for a total of 44 out of the 103 fired upon. Sole damage reported from these attacks was done to a one-quarter ton trailer. There were no personnel casualties reported.

b. The 462d AAA AW Bn (M) had, among other missions, the protection of XII Corps artillery units and did considerable firing at enemy aircraft which attacked their area. On 17 March, of 51 E/A observed by them, 30 Me-109s and 6 FW-190s were engaged at altitudes of 1,000 to 3,000 ft. Five were claimed destroyed and 7 probably destroyed. On the 18th, 4 more Cat Is and 2 Cat IIs were claimed out of 14 E/A engaged, giving the 462d a two-day total of 18 claims out of 50 E/A fired upon.

c. Some units saw jet-propelled A/C for the first time this week. In their first few engagements, the deceptively high speeds flown caused many gunners to allow insufficient leads and tracers trailed the targets. However, improvement was rapid and, in proportion to the number of jet planes over, a good many were claimed shot down.

d. AAA units in the advance were almost continually engaged in ground fire missions, as well as in air defense. One outstanding piece of action occurred when a composite platoon of the 390th AAA AW Bn (SP), attached to a 26th Inf Div task force, arrived at the town of AUSSEN to find a bridge there across the PRUM River was blown. Word was received that the bridge in the town of BURSCH, to the South, was intact. The platoon commander offered to take his half-tracks to BURSCH and try to secure the bridge and the plan was accepted by the task force commander. The lieutenant's jeep and three half-tracks raced full speed for the town running machine gun and small arms fire, and dodging hand grenades. The two hindmost of the three half-tracks delivered covering fire, destroying 4 enemy vehicles and killing or wounding 25 enemy soldiers during the mad dash for the bridge. The bridge was reached and found intact. Intense enemy small arms and machine gun fire was directed at the half-tracks from houses across the river, and soon artillery fire fell in heavy concentrations. However, the lieutenant had radioed the task force to come down and secure the bridge and it was held until tanks and infantry reached it and effected their crossing, following which the tracks took cover among the buildings in town.

e. In an attack by the 65th Inf Div on the SIEGFRIED Line city of DILLINGEN, 40mm guns of the 546th AAA AW Bn (M) were emplaced to deliver supporting fires. In order to secure a satisfactory field of fire, approximately 100 trees had to be cut down just prior to the time of the attack, at 0630 hours. Telephone communication was established with an Inf OP, and fire missions were requested from there by the Inf battalion commander. Four enemy gun and one machine gun positions were located by their flashes and silenced by the 40mm's. Numerous pillboxes were also engaged and the entire mission was of such success that advancing infantry drew no fire from any positions in the area fired upon.

f. PWs were taken by everyone this week, it seems. AAA units contributed their share, also, and many prisoners were taken after short, sharp fire fights. Largest number so far reported taken was 500 taken by "A" Battery of the 796th AAA AW Bn (SP) in a few days' time, 300 being taken in one day. On 16 March, platoon elements of the 390th Self-propelled, assisted by 3 TDs, fired into some woods and took 500 PWs, killing in addition over 100 Germans, later found there by an I & R platoon.

g. With the rapid advances on the ground leaving the German populace shocked and frightened, there still remain behind "master race" members with the will to resist, either in or out of uniform. For these, AAA firing sections, isolated as they generally are in open fields and on hilltops, should be particularly on the lookout. All gun crews should be thoroughly instructed in curfew and other restrictive measures placed on the German population so that they will know what to expect, and security and non-fraternization measures should be fully explained and properly emphasized. A reminder is also in order to be on the watch for mining and booby-trapping activities. An occurrence such as that of last December, when a Hq and Hq Btry of an AAA AW Bn billeted in ST AVOLD was blown up by a time bomb, killing 19 and wounding 17 others, is not to be regarded as a present impossibility. In line with this, the following is quoted:

> "a. Attention of all units is called to the danger of time bombs, booby traps and other secreted demolitions in buildings, on bridges, in culverts, at road junctions, etc. With the enemy withdrawing and desirable billeting and CP facilities limited, time-bombing and booby-trapping by the enemy is highly probable. That the enemy is employing these weapons in Third US Army zone has already been confirmed by PW. All units should be warned to take nothing for granted and to exercise every precaution against time bombs and booby traps." (Source: Third US Army G-2 Periodic Rpt No. 282)
>
> "d. This is Enemy Territory. At 0900A, 17 Mar 1945, 8 men were killed and 3 wounded near ELSDORF (F-1760) when members of a Bomb Disposal Squad lifted a box of TNT from a pile of 4 boxes of enemy explosives which had been inspected 15 Mar and found free of mines and booby-traps. The box of TNT had apparently been booby-trapped since its previous inspection. Casualties such as these will continue unless all troops realize that we are in hostile country, surrounded by people who are still our enemies. Our victory over them has only served to increase their animosity towards us. They will regard lack of vigilance on our part as a sign of weakness and be quick to take advantage of it." (Source: First US Army, thru Third US Army G-2 Periodic Rpt No. 282)

h. Attached as an inclosure is the weekly aircraft recognition annex.

AIRCRAFT RECOGNITION

The He-280 is a jet-propelled plane rarely seen on the Western Front, but a reported sighting of it in late February over Ninth US Army suggests a renewal of its acquaintance may be worthwhile.

Heinkel designed this aircraft, first calling it the He-180, from which model the improved He-280 grew. It has a length of 34' 2" and a span of 39' 4" and is powered by two BMW 003 propulsion units slung under the wings.

In performance it rates with the He-262. Estimates of its speed vary from 500 to 600 m.p.h., with endurance judged to be about 40 minutes. It has a minimum climbing speed of 315 m.p.h. and can reach a height of 32,800 ft in five minutes.

Four low velocity 30cm guns are grouped in the fuselage nose.

AAA WEEKLY INTELLIGENCE REPORT NO. 35

Period:
230400A Mar to 300600A Mar

1. SUMMARY OF ACTION

a. On the ground during the period, XII Corps' OPPENHEIM bridge-head over the RHINE became firmly established and expanded to such proportions that it no longer could be described by so limiting a term. VIII and XX Corps also crossed and the end of the period saw all Third US Army's units far past the RHINE and deep into GERMANY. The OPPENHEIM crossings were made under many attacks by the Luftwaffe which began last week and carried on into the first three days of the current period. Attacks occurred during early morning hours, but by far the larger number were made from dusk to 0230A hours in the morning. Flights of as many as 20 or more single and twin-engined E/A were involved, with jet-propelled planes used frequently at night to bomb and strafe. Many E/A appeared at altitudes under 5,000 ft, but a sizable number were engaged by AAA units at altitudes from 8,000 to 15,000 ft, and at slant ranges up to 13,000 yds. Troop concentrations, highway traffic, dumps and artillery were frequent targets, but most numerous were attempts to strafe the bridges and hit them with rockets and bombs both by day and by night, with many flares dropped in aid of the bombing. AAA gun sites were attacked and, for the first reported time, a direct hit by an enemy rocket was made on a gun position, when a rocket struck inside a revetment, killing 3 men and severely wounding 5 others. Establishment of an exempted 12/ with ceiling at 15,000 ft permitted AAA to work at full effectiveness as testified by the number of planes destroyed. No bridges were touched, material damage was slight and casualties few. AAA gun battalions as well as Antimatic -empere units saw considerable action and were firing constantly through the night, scoring many kills. On 26 March, activity slackened and thereafter was almost negligible for the remaining four days of the period.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	185	340	79	46
To Date	1,914	4,530	668	353

	PAC OTHR AREA	PAC ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	3

2. GAF TACTICS NOTES

a. Nearly all E/A took violent evasive action both upon entry into a defended area and following engagement by AAA weapons, tactics fostered by the desire for self-preservation which, however, do not lead to bombing accuracy as their lack of effectiveness proved. Zig-zagging was common, but a most typical maneuver was to dive, then climb and circle. Diving turns also were used in avoidance.

b. Dive-bombing tactics were frequently attempted, usually at 45° angles of approach to bridges, and at diving angles varying from steep to fairly flat glide-bombing attempts. Skip-bombing by an Me-109 against objectives via OBERWESEL, near the RHINE, was reported.

c. The 599th AAA AW Bn (M) told of a novel stratagem by an enemy photographic plane. It came in with lights on to attract AAA fire and then dropped magnesium flares, photographing the active AAA defenses below.

3. MISCELLANEOUS NOTES

a. Third US Army's AAA units this week scored their 1,000th enemy plane claimed destroyed or probably destroyed, for an average of better than four planes a day during the 241 days of operations this Headquarters completed on 300600A March.

b. The 129th AAA Gun Bn contributed materially to this accomplishment when, in one night's firing in an exempted IAZ this week, it claimed 17 knocked down and 4 probables and the next night claimed 10 more Cat Is and 4 Cat IIs, making a two-day total of 35 claims. Gun engagements were mostly after dark and at altitudes averaging roughly 6,500 ft, but there were many at altitudes of 10,000 ft and over. However, sufficient E/A flew at low altitudes to give their machine gunners good opportunities, too, and several Categories were claimed by them.

c. A well-placed German 20mm AAA Gun on the East bank of the RHINE above RHEINS had held up the advance of elements of the 347th Inf for two days, after its initial river crossing. The position had a very low silhouette and was approximately 6 ft in diameter, so that it was hard to see or to hit. At the request of the 347th Inf's CO, the 655th AAA AW Bn engaged the target on 26 March, from the West side of the river. The range was 3,300 yds and the target so small and so placed that it could not be seen at that distance, even with binoculars. Indirect firing procedure was accordingly employed, with an Inf OP doing the adjusting. 40mm guns were laid on target, using map data and improvised range and azimuth drums devised by the 655th AW Bn. (See: NTOUSA AAA Notes No 22, and these reports, No 23). Sensings were given by the OP in terms as little as 5 yds range and 1 mil azimuth in attempts to get a direct hit. Single shots were used for adjustment, but fire for effect was done on auto-fire. A total of 88 rounds of 7 Sec 40mm (HE) ammo was fired, of which 9 were reported by the OP as hits, inflicting damage and casualties on the position. Actually, accuracy was higher as several of the rounds burst short of the target due to the tracer burn-out point.

d. Having just completed transporting troops of the 80th Inf Div, a driver of the 653d AAA AW Bn (M) was on his way back to a town in GERMANY to rejoin his unit, one night recently. Outside the town of KUSEL he came upon a parked convoy of jeeps and started by them when vehicles were seen approaching from the opposite direction and he pulled into the jeep line to let them pass. The oncoming manner and odd blackout lights of the first vehicle attracted his attention and, as it went by, he saw it to be a German half-track towing a gun and filled with German soldiers. He immediately pulled out of the jeep line and across the road so that his truck blocked the rest of the oncoming German vehicles. Jumping from his truck cab, he shouted at the occupants of the first truck to surrender, instead of which they grabbed their weapons and a few dashed for some nearby woods. He immediately opened fire over their heads with his tommy gun, which caused them to throw away their weapons and shout "kamerad" in a very convincing manner. His firing attracted some help from the personnel in the jeep convoy and, in all, approximately 300 prisoners were taken from the vehicles and surrounding territory.

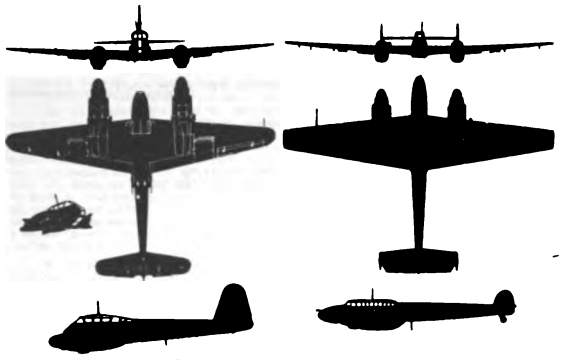
1 Incl - Aircraft Recognition (Me-110 - Me-410)

DISTRIBUTION:
"A" & "B"



RESTRICTED

AIRCRAFT RECOGNITION

In 1939, the Me-110 was Germany's standard long range, twin-engine fighter. Although now superseded by the Me-410 it is still extensively used as an attack bomber, carrying a surprisingly heavy bomb load for its size. The Me-110, also an older member of the GAF, is nevertheless still rated one of Germany's principal fighter bombers.

Digitized by Google

While at first glance, the planes appear similar a little study reveals marked differences. The most striking difference is the design of the tail assemblies. Twin fins and rudders of the Me-110 furnish another noticeable point of distinction, and difference in wing tips is quite apparent. On the Me-410, excellent outlook beyond the fuselage nacelle, which has been shortened. Close inspection will reveal many other differences so that one should never be mistaken for the other.

AAA WEEKLY INTELLIGENCE REPORT NO. 36

Period:
300600A Mar to 060600B Apr

1. SUMMARY OF ACTION

a. Enemy air activity showed no sign of abating this week and, in fact, increased considerably over last week's efforts. Improved flying weather permitted the Luftwaffe to react to our penetration of the WERRA River defense line by striking repeatedly at armored spearheads, supporting units, and at bridges. Activity was at a comparatively low scale the first three days of the period, but on 2 April it spurted and a peak effort with approximately 180 planes was reported, dropping thereafter to daily averages of 60-70 E/A over the area. Me-262s were in much evidence the forepart of the period, bombing a bridge over the MAIN River vic GROSSAUHEIM and strafing traffic on the Reichsautobahn vic ALSFELD. After that they were seldom seen and Me-109s and FW-190s, with a light sprinkling of Ju-87s, Ju-88s and Me-410s, came out to attack elements of the 4th Armd Div and supporting units and forward elements of the 6th Armd Div. Quite a number of these passed up the armor to strafe Field Artillery, road convoys and other such targets further back. Only 3 or 4 planes were seen in the rear of Corps boundaries, however. Below KASSEL, assembly areas and artillery of the 80th Inf Div were attacked. AAA attached to other Infantry divisions also had many engagements, sometimes in self-defense as their gun positions were several times attacked. The enemy's air aggressiveness fell off sharply after 2 April and many flights appeared bent more on sight-seeing than anything else as, for example, when a flight of 30 E/A flew along over a convoy making no attacks and lingering in the area until driven off by a flight of friendly fighters. Most E/A flew at low altitudes (100 - 6,000 ft) making a field day for AAA automatic weapons units which, on 2 April, alone, claimed 72 planes destroyed and 32 probables, with many others damaged. Air attacks punctured two pontons of the bridge at GROSSAUHEIM and destroyed a treadway bridge over the WERRA River at CREUZBERG. An attempted bombing of a bridge at GR HERSCHIA over the WERRA was unsuccessful. Some few casualties were caused and other materiel damage was slight.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week and to date from 1 August 1944 (corrected) are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	190	490	149	76
To Date	2,068	5,080	871	491

	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	5

2. GAF TACTICS NOTES

a. Air tactics appeared standard for the most part, with nothing particularly novel emerging. Pilots indulged their penchant for attacking low from the Rear, out of the sun, in the morning hours and coming in somewhat higher to dive during meantime. Cloud cover was used whenever possible.

b. The 550th AAA AW Bn reported an attack by 12 FW-190s which came out of the clouds in three lines of four planes each to drop fragmentation and demolition bombs on Field Artillery positions. Despite AA fire they remained on their bombing course until bombs were released only after which did they head for the clouds.

c. In the jet-propelled attack on the bridge over the MAIN River vic GROSSAUHEIM, Me-262s came in at 3,500 ft to dive at a 30° angle and speed of 460 mph, dropping anti-personnel bombs.

d. Another tactic not usually employed was reported by the 550th AAA AW Bn. Upon being engaged an Me-109 went into a vertical climb from 1,000 to 4,000 ft and disappeared in clouds. When last seen it was smoking badly, however, indicating this is not the best way to avoid AA fire.

3. MISCELLANEOUS NOTES

a. AW units had many intensive engagements with low-flying enemy planes as daylight strafing replaced last week's night and high-level bombing attacks. Of the 168 claims arising from engagements on 2 April, more than a third were made by the 467th AAA AW Bn (SP). Its fire units, deployed in protection of armored columns, CPs and bridges had their biggest day on record -- perhaps the biggest of any AAA unit in the ETO -- to claim 34 Cat Is and 6 Cat IIs. In addition, another E/A was claimed damaged (Cat III).

b. During a period highlighted by outstanding achievements, at the least outstanding among AAA units was the feat of the 546th AAA [illegible] an Me-109 with one round of 40mm ammo. Weight [illegible] and the plane, a "flamer", crashed a mile away. [illegible] that nothing succeeds like success.

c. Other units performed outstandingly and the 777th AAA AW Bn, a self-propelled organization, had many engagements with E/A attacking leading armored columns of the 6th Armd Div to which it is attached. Only slight damage and casualties resulted from these air efforts but the 777th, on the other hand, is able to boast taking a toll of 25 Cat Is, 19 Cat IIs and 11 other badly damaged.

d. On the ground, AAA units had many skirmishes with enemy foot troops, taking PWs and inflicting casualties. In one instance, half-track section No 220 (one M15 and one M16 track) of the 390th AAA AW Bn (SP) was attached, with other sections, to a task force of the 26th Inf Div having the mission of clearing out by-passed pockets of resistance in the rear of forward elements. The task force had just entered the town of HITZKIRCHEN and section 220 had occupied positions NW and S of there when a column of 200 jerry foot troops approached town from the NW and 300 approached from the S in an evident attempt to encircle and trap the task force. Section 220, having received permission, opened fire on the enemy as soon as they emerged from the woods and were well into the open. As a result, 200 to 300 enemy were killed and wounded and the attack stopped cold. The remainder were later mopped up by the infantry.

e. As further evidence that there is constant need for alertness, a few of the week's occurrences are cited. Civilians, taking advantage of the noise of anti-aircraft firing, used the opportunity to fire rifles at the gun crews nearby and caused several casualties. A firing section of the 455th AAA AW Bn, having just completed an all-day convoy, bedded down for the night in the vicinity of field artillery it supported. At 0400 hours, the guard challenged the source of a noise, which signalled an attack on the section by enemy small arms, machine guns, bazooka and mortar fire. The attack was beaten off but only after one crew member was killed and four seriously wounded and a 40mm gun damaged. A platoon of the 390th AAA AW Bn (SP) while traveling in convoy was ambushed by approximately 200 enemy troops firing small arms and throwing grenades from both sides of the road. One officer and six enlisted men were killed, two were wounded and six listed as missing (two of whom later escaped capture and returned). The half-tracks opened fire and killed 10 enemy and wounded 35.

f. Taking time from their duties of providing AAA defenses for various installations, men of the 551st AAA AW Bn helped the supply services recently by collecting 1,347 empty jerry-cans in one day.

g. Variety is the Spice of Life Dept. In combing an area S of the 76th Inf Div boundary, men of the 778th Self-propelled Bn took 78 PWs, destroyed three 88mm gun positions and de-booby-trapped a searchlight position. The 567th AAA AW Bn: handled 4 Russian soldiers who escaped from a German labor camp; a Belgian, arrested for murder of a Belgian MP and who had been released from confinement by the Germans, was returned to allied custody; took a PW; expedited the needs of an enemy ambulance full of German soldiers and one woman who was about to have a baby.

h. Said the Commanding Officer of the 27th AAA Gp (XII Corps) to the Commanding Officer, 21st AAA Gp (30th AAA Brig), "We are now moving toward the ELBE River where we can share on IAI with the Russians. Please sign a receipt for these bridges over the RHINE." So the 21st AAA Gp command gave a receipt as follows:

OFFENBURG, GERMANY
270800 A March 1946

"Received from the 27th AAA Gp four (4) bridges across the RHINE, with bridges and approaches intact, and the mission of providing AA protection for same."

4. (1) Periods of greatest air activity over Third US Army have always accompanied its periods of greatest advance. Static or slow-moving periods such as those occurring along the MOSELLE River were times of slight air activity. In August, December and March, however, during which months there were rapid advances, AAA communications were not only loaded with activity but stretched by distance to the point where wire communications were nearly impossible, a luxury for the slow. At one time, for example, Third US Army's zone stretched 650 miles from BREST to VERDUN, perhaps the longest Army area in modern history.

(2) As a result, since Third US Army became operational upon the continent, the 38th AAA Brigade and subordinate units and Corps and division units have relied on radio almost exclusively for command and air warning functions. This use of radio has not been confined alone to inter-unit work but has also been the primary means of communication within the various gun and automatic weapons battalions.

DECLASSIFIED

Digitized by Google

(3) It was in early October, when movement across France slowed down, that a period of trial and correction in AA radio communications for early warning and radio systems took place. The procuring of FM radios from the Fighter Control Squadron solved the long range voice radio problem and no problem existed within gun battalions with their SCR-193 radios or automatic weapons battalions with their SCR-694 and various FM sets, since early December there was not been one roll of wire used for communications within the 37th Brigade except for wire run by AW platoons to their various gun sections and by gun battalions to their batteries when constraints permitted. The use of radio has proved itself invaluable in recent operations, such as when communications were continually maintained between units deployed along the WESEL river and others far back in the RHINE AREA.

(4) Because the 38th AAA Brigade has, of necessity, relied on radio, it has become radio's staunchest supporter among AA units on the continent. Its emphasis on maintenance, proper sighting, net procedure and security in its radio communication radio has become the foundation of its entire operations.

j. Another AAA unit recently passed a milestone in its history, when the 3 rd AAA AW Bn (M), on 19 February 1946, completed its third continuous year of overseas duty. Eleven officers and 110 enlisted men left over from the original battalion departed from the 1st, on 19 July 1943, for Iceland as part of the 61st Coast Artillery (AA). After 1 year of hard, monotonous work on a one hour manning status with fire fighting activity to enliven the time, the unit went to the Marianas where it was separated from the 61st CA Regt and reorganized as a separate battalion. Thereafter, it was trained on new equipment and placed under the tactical operational status defending airfields of the Tenth Air Force. Members of the battalion claim some of the first, if not the first, Category As for shooting down buzz-bombs along the English coast. The unit landed in France with VIII Corps and under Third US Army, participated in the Normandy and Brest campaigns, and is still going strong.

AIRCRAFT RECOGNITION

With this issue of Aircraft Recognition we introduce the Red Air Force. As the Allied advance into central Germany continues, Russian aircraft may be seen on an increasing scale. The standard national marking is a red star.

The two fighter bombers pictured below are currently operational in the Red Air Force. Basically the same in design, the most apparent difference is in the power units. The Lagg 3, which is the older, has an inline engine and a 20mm cannon which fires through the large spinner. The tail wheel is fixed.

The La-5, powered by a radial engine, is in extensive use. It is said to be the USSR's answer to the FW-190 which it closely resembles. Care must be taken not to confuse the two.

AAA WEEKLY INTELLIGENCE REPORT NO. 37

Period:
0606000B to 1306000B

1. SUMMARY OF ACTION

a. No new trends were noted in enemy air efforts this week. As Third US Army's divisions thrust across central GERMANY the Luftwaffe, as in the previous week, launched sharp, small-scale attacks at armored spearheads, forward infantry elements, and at the bridges over which the, moved, in efforts to harass and slow the advance. Most activity occurred in XI Corps zone where the 6th Armd and 76th Inf Divs drew considerable attention. A/A were over every day of the week in numbers averaging 50 - 60 per day. Tank and truck columns, field artillery, CPs and miscellaneous targets of opportunity drew attention as almost all aircraft flew by daylight in search of them. A Class III dump vic (H7073) was attacked, bridges over the WERRA river near SPIEKA (H7442) and GERSHENG (H7575), and over the SAALE River vic KOLEN (J7625905), were bombed and strafed. Several CPs were bombed and an airfield near WARNSDORF (H7172) (H8770) was attacked three days running. There was also an attack on a truck convoy of German PWs. A good many planes were over on reconnaissance, but infrequently penetrated deeper than Corps. In the rear areas, A/A were seldom seen and few attacks were made. FW-190s and Me-109s were in great majority of types observed, though a few Me-111s, Ke-110s and jet-propelled Me-262s were seen, a flight of 6 of the latter being reported and several smaller formations. In addition, a few odd, unrecognizable types were reported and one of them, a trainer bearing on the fuselage the lettering "Luftwaffe Schule 1 Dresden Tel 66411", was shot down by small arms fire. Damage from air attacks was not heavy. Two gas-laden C-47s coming in to land were attacked while still some distance from their field and shot down. Other attacks upon the field made within range of protecting AAA were driven off without further damage. Several vehicles were damaged and there were personnel casualties, including an undetermined number of the German PWs who were bombed.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944, are as follows:

To Date	168	31	0	3

2. GAF TACTICS NOTES

a. In attacking the C-47s ferrying gasoline 10 Me-109s and Fw-190s, lying in wait at high altitude, dropped down to engage the slower cargo craft which were approaching the field to land. After shooting down two, they followed in to strafe A/C lining the field. This brought them within range of AAA, however, and they were driven off.

b. A summary of activity received from the 777th AAA AW Bn (SP) for the period 30 Mar - 10 Apr gives interesting data on air tactics employed against the 6th Armd Div, to which it is attached. In part, it states: "The attacks...have been....directed mainly at columns and at forward troop assembly areas. Trains, dumps, bridges and CPs have been attacked very lightly. The damage has been slight considering the large numbers of aircraft involved. There has, of course, been some damage and there have been casualties, but much less than the damage that could have been caused by an aggressive air force. Most of the attacks have consisted of only one pass, the aircraft employing hit and run tactics, and not pressing home a vigorous raid...Most of the flights have consisted of singles and pairs. A few large formations (12 - 20) have been over, but not many. Lately, there has been an increasing trend towards flights of 4 - 6 aircraft; most of these have been attacks. Most of the A/C have been Me-109s or FW-190s. There have been a few jets, both Me-262 and Me-163, and one Ju-87 was reported...The jets all operated singly, and have made attacks...The time of day has not mattered, as planes have been over from dawn to dark. However, the "peak" seems to have been mid-morning (0800 - 1100) and mid-afternoon (1400 - 1600). Very few attacks have been at dawn and dusk." (That the 777th has had ample chance to observe and counter Luftwaffe tactics is attested by the fact that, after screening, for the period mentioned formal claims for 36 Cat Is and 22 Cat IIs were submitted, as well as 8 Cat IIIs.)

3. MISCELLANEOUS NOTES

a. Once again, automatic weapons units enjoyed the larger share of activity as most raids occurred during daylight and at low altitudes, providing them with plentiful targets. The 777th AAA AW Bn (SP), attached to 6th Inf Div, demonstrated sharpshooting ability and during one 18 hour period, engaged 15 of 21 enemy planes scoring 5 Cat Is and 7 Cat IIs. No damage was occasioned to protected FA and Infantry and only one man was wounded despite intensive bombing and strafing. On the preceding day, 6 Cat Is and 6 Cat IIs, plus 2 Cat IIIs were claimed in an equally successful defense.

b. In one five minute period from 1455 to 1500 hours on 10 April, the 590th SP Bn had activity over the 26th Inf Div area comparable to that which they experienced Southeast of BASTOGNE last December. 15 E/A attacked FA positions, Infantry, convoys and an Arty observation plane in sharp strafing attacks only to lose 7 planes which were seen to crash and 2 probables.

Digitized by Google

c. Reappearance of jet-propelled A/C this week, after almost complete absence last week recalls the many attacks by jets during the MAAS and RHINE River crossings and makes a glance at their tactics timely. Excerpts from a report of the 413th AAA Gun Bn covering the two crossings state: "In the late afternoon [redacted] and one FW-190 were over the BRETTENHEIM crossing site for 25 minutes. [redacted] dropped bombs in a 50 yd/sec glide from 12,000 ft; the glide began at 15,000 ft. Bombs were not steady, but were characterized by rapid changes in course and speed. Speeds varied from 240 to 500 mph. Possible jets showed rapid acceleration white smoke was seen to come from the engines for a second or two. The rate of climb was high. Heavy AA fire control equipment is fully capable of coping with the jet although jets are difficult to hit due to their ability to make very rapid changes in speed, altitude and direction. No damage was done at the crossing site...On 20 March the peak of enemy air activity over the MAAS crossing was reached. 2 Me-262s and ... were destroyed. The jets were shot down in level steady flight at 15,000 ft...On 21 March 1 Ar-234 at 8,000 ft altitude, vic 400 mph in a dive of 50 yds/sec was engaged and shot down by 90mm fire." The 115th Gun Bn employed its equipment well and in a 6 day period 16 Cat Is and 8 Cat IIs were claimed, most of them engaged at altitudes of 6,000 to 16,000 ft, once again demonstrating the adequacy of the SCR-584 radar and M-9 director to cope with and destroy enemy planes at higher altitudes than normally permitted.

d. An unusual occurrence of recent days has come to notice through the statement of a Chemical Company enlisted man, submitted in support of a formal claim for destruction of an enemy plane. "On the evening of...I was stationed at the RHINE River crossing at OPPENHEIM, GERMANY. The German Air Force came in early in the evening and dropped flares and attacked the bridge by strafing and bombing. Section No. 7 of Btry "D", 599th AAA AW Bn, was firing at a plane and after they hit it it began to fall looking like it was out of control. As it fell towards the ground another German plane came in under it and the two planes collided in the air. There was a big explosion and both planes fell to the ground, burning." A question: should the unit be granted one or two Cat Is?

e. In addition to such defenses as booms and nets, part of the defenses against waterborne demolitions, "Frogfolswimmer" (swimming saboteurs) and the like were provided to the RHINE River crossings at MAINZ, while under Corps control, by Btry "A" of the 465th AAA AW Bn, under XX Corps AA. The Battery Commander was given operational control of 4 searchlights from the 226th AAA S/L Bn, 2 SCR-584 radars borrowed from gun battalions and charged with coordinating the waterborne defense with a platoon of light tanks assigned the same task. The equipment concerned was employed on the West bank as a safety precaution, and fields of fire were so laid out as to avoid endangering engineer personnel working in the vicinity of the bridge. All suspicious objects floating downstream towards the bridge were engaged and destroyed by gun fire. The 40mm gun was found to be especially efficient at this task. Eye-shooting with Stiffbey Stick sights was used with ranges set in, and never more than 3 rounds were required to hit and destroy waterborne targets. The light tanks mounted 75mm guns and employed ammunition with a very sensitive fuse. M51 mounts were not used due to the danger of ricochet. Small arms fire was employed against smaller targets. At night, the radars were used in conjunction with searchlights in picking up and illuminating waterborne targets. The switchboard at the battery CP had a line running to the radar and searchlights, which were on a hot loop, and another hot loop to the tanks with a third loop connecting all AAA fire units employed on the mission, an arrangement which facilitated control and expedited warning of floating targets.

AAA WEEKLY INTELLIGENCE REPORT NO. 38

Period:
1306008 to 2006008

1. SUMMARY OF ACTION

a. Hostile air activity slackened somewhat as an estimated 202 enemy aircraft flew over the area this week, about halving the effort of the previous period. While a considerable number of daylight attacks were made, the Luftwaffe began reversion to familiar night tactics, strafing lighted vehicles on highways and making other similar nuisance attacks using small flights of aircraft. Columns, assemblies and installations of nearly all Armored and Infantry divisions were bombed and strafed in daytime raids, and Corps Artillery units were several times attacked. With most effort devoted to these targets, there were still many other attacks made, both by day and by night. Class III supply installations vic MEININGEN, HELLESHAUSEN, HURZBURG and HERGADORF, bridges vic UHLAU, KRONACH, HAHAU and other places, and highway traffic all through the area and as far separated as HAHAU and HERSFELD, all were attacked. Night intruders passed through Corps rear boundaries to hit at targets far back. In addition, there was considerable reconnaissance activity. There were few large formations, and 12 FW-190s which strafed Corps Artillery was the largest reported. E/A of all types were seen, including jets, and Ju-52 transports probably used to evacuate personnel from the RUHR pocket. Indicating the low estate to which the once-tough Luftwaffe has sunk was the appearance in front line missions of Arado training planes and composite, "pick-a-back" aircraft. One of these latter was even reported employed for a strafing mission. In one of the Week's outstanding events, an AAA battalion motor sergeant shot down 3 Me-109s and badly damaged a 4th out of 5 engaged, using the single .50 cal machine gun mounted on the cab of his wrecker.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944 (corrected), are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	70	202	48	30
To Date	2,274	5,617	989	532
	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	3

2. GAP TACTICS NOTES

No new tactics were reported. As usual, the enemy flew in small jagdes and at low altitudes, taking advantage of terrain and clouds and of the sun. At night the planes flew at altitudes so low that gun battalion radars had difficulty in picking them up and little heavy AA fire could be thrown against them.

3. MISCELLANEOUS NOTES

a. With hostile air activity apparently once again on the wane, a short summary of the past month's activity seems not improper. In the thirty-one day period from 15 March through 14 April, Third US Army's Antiaircraft Artillery units engaged many planes, most of which made attacks upon ground targets. While some slight damage was caused and some casualties inflicted, in proportion to the air effort they were poor payment, indeed. In throwing back these many air attacks, AAA units claimed to have destroyed 165 enemy planes and probably destroyed 260, with many others damaged, for a total of 715 Category I and IIs. Biggest day was 2 April when over 100 members of the Luftwaffe were claimed shot down. Biggest day, too, for any individual unit was the same 2 April when a single battalion claimed 40 planes shot down, with an additional one damaged. Ammunition expenditures for the period were as follows:

Caliber	No. rds
90mm	7,855
Pozit (90mm)	857
40mm	44,185
37mm	89,465
.50 cal	1,573,532

b. Oh, Boy! What a Wonderful Day Dept. In a day of accomplishment as full as any yet reported for a single individual, Friday the 13th will probably long stand in the memory of the motor sergeant with Btry "C" of the 465th AAA AW Bn. On that day he was rolling in convoy toward CHEMNITZ when his wrecker was stopped by Engineers at the Reichsautobahn outpass near GERA, requesting assistance of him and the .50 cal machine gun mounted on the roof of his wrecker. Two enemy vehicles had just come into view on a road leading South from the autobahn. The sergeant obliged and set both vehicles afire with his gun. He then reloaded the weapon and took off to catch up with his column. A bit further along he came upon the Btry mess truck bogged down with a flat tire so stopped to help. While so engaged he heard a cry, "Hold onto your hats, boys, here they come," and, looking up, he saw five Me-109s bearing down upon him in single file and at low altitude, straight down the highway. The sergeant climbed once more into the ring mount in time to fire at the second of these aircraft, his gun still warm from the previous ground firing. The plane literally "flew down his gun barrel" and was immediately hit, and crashed within view of the wrecker. The other E/A, apparently uncertain as to what had happened, turned about and once again came down the highway. The foremost plane this time was hit, crashing 300 yds from the other, and, as the remaining three circled, a third, flying low across the road, was hit and crashed a kilometer away. The fourth plane fired at received hits in the motor and was smoking badly as it flew out of sight. The total ammunition expenditure was just a neat 225 rounds. The German belief in mythology and superstition must have been considerably strengthened by the day's occurrences.

c. German composite, or "pick-a-back", aircraft are not an entirely new development though not a great deal is known about them, most information having come from photo interpretation. However, it is believed that this week's occurrence was the first time one ever was reported in so unsuited a mission as strafing. Two and possibly three of these were shot down by automatic weapons units with forward elements of divisions but the destruction of each was so complete little could be told from the wreckage. Composite aircraft ordinarily consist of a Ju-88 surmounted by an Me-109 or FW-190. The Ju-88 is loaded with explosives and is released and guided towards the target by the fighter. While it may be that other twin-engined types than Ju-88s have been used, no other has been definitely identified.

RUSSIAN
AIRCRAFT RECOGNITION

GENERAL

The Red Air Force did not start its development until the middle thirties. The impetus given to the industry by the first five-year plan has brought to the surface several aircraft designers who have evolved and later enforced a definite designing policy and program. The young designers included: Yakovlev - designer of liquid cooled fighters, Lavetchkin - who designed radial engine fighters, Petlyakov - designer of light twin-engined bombers and Tupolev - who specialized in heavy bombardment planes.

DESIGN POLICY

In studying the different planes, operationally used by the Red Air Force, one can divide them into three groups; original Soviet designs, designs inspired by foreign products and finally foreign designs, modified by the Soviets in keeping with their design policy.

DECLASSIFIED

Digitized by Google

One of the policy-makers is Lt. Gen. Yakovlev, who is a believer that in fighter everything should be sacrificed to weight reduction. This is apparent in all of his designs - the YAK fighter series, which are usually fast and manoeuvrable owing to the almost complete absence of armour. In an interview, pilots of the French 'Normandie', operating on the Soviet front and equipped entirely of French planes, stated that YAKs will easily outperform the Spitfire and the FW-190 and are more pleasant to fly. It is the lightest fighter in the world.

This policy has been extended to American products, which have been modified in USSR. Thus the reason why the Soviet pilots are still swearing by the P-39, which is obsolete with us, is because they removed 1200 lbs of armour out of it and obviously increased the speed and manoeuvrability. On the A-20 and B-25 similar 'disarming' work has been done. Often the nose gun has been removed and replaced by a navigator's compartment.

On the other hand the Soviet designers, who are very conscious of the requirements of the ground support units, believed that a special armored type aircraft had to be developed and the famous Stormovik was designed and built.

Finally the good old American DC-3, which is built in USSR has been modified by an addition of a dorsal turret, just aft of the astral dome.

In discussing the role played by aviation in the war, it becomes clear that the Soviet believe in the use of planes for the most unorthodox uses. Training planes of the 'piper cub' variety have been known to be used as night bombers, and also as air-ambulances, with coffin-like cylindrical containers for the wounded strapped to the wings. Bombers extensively used for guerilla warfare and partisan parachute supply work, etc.

Until very recently there was no such thing as strategic aviation in USSR. They readily admit that their bombing is confined to not more than 200-300 miles from the front and they have a very small number of heavy bombers. Practically no long range reconnaissance is made, the reconnaissance ships photographing only targets in the immediate vicinity of the advancing armies.

Originally the different types of planes were designated by abbreviations of their name types:

IB - (Skorostny Bombardirovschik) stood for light bomber
SB - (Srednay Bombardirovschik) stood for medium bomber
TB - (Tyazhely Bombardirovschik) stood for heavy bomber
U - (Uchebny) stood for training, etc.

In 1940, out of many experimental designs, a few were selected for production, and in 1941, they were designated not any more by types but by the abbreviations of the designers family name. Thus we have the YAK-9 and LA-5 fighters, PE-2 bombers, etc.

FIGHTERS

YAK-1 (Designer: Alex YAKovlev). A single-engine liquid cooled low wing monoplane. Power plant is rated at 1050 hp at 14,800 ft. Normal cruising speed 248 mph at 15,000 ft. Service ceiling is 31,000 ft with normal load.

Armament consists of 2 x 12.7mm fixed machine guns in forward fuselage, 2 x 12.7mm fixed machine guns in the wings and one 20mm cannon firing through the hub. Bomb and rocket racks under the wings.

One of the most currently used operational fighters.

YAK-9. A single liquid cooled engine low wing monoplane. Power plant is rated at 1260 hp at take-off. Normal cruising speed 345 mph at 18,000 ft. Service ceiling is 35,000 ft with normal load.

Armament consists of 2 x 12.7mm fixed machine guns in the forward fuselage and 20mm cannon firing through the hub. A 37mm cannon in place of the 20mm has also been reported.

Considered the best USSR interceptor fighter. The lightest fighter in the world. It is exceptionally manoeuvrable.

An improved version, the YAK-7, has been reported in August 1944. It is practically the same except for slightly different internal wing construction and coolant grille placed in the leading edge of the left wing close to the root.

LA-5 (Designer: Lavotshkin). A single-radial engine low wing monoplane. Power plant is rated at 1600 hp at 17,000 ft. Normal cruising speed 330 mph at 18,000 ft. Service ceiling is 34,000 ft with normal load.

Armament consists of 2 x 20mm fixed machine guns in the forward fuselage and 2 x 12.7mm machine guns in the wings. Also bomb racks under wings.

It is one of the Soviet's newest fighters and is in constant operational use against FW-190's.

An improved version (mostly better aerodynamic streamlining) - the LA-7 has been reported in July 1944.

LAGG-3 (Designers: Livotshkin, Gorbunov and Gudkov). A single liquid cooled engine low wing monoplane. Power plant is rated at 1,100 hp, giving it an estimated maximum speed of 347 mph. It is built of plastic-bonded wood and is smaller than American and British fighters. It is in service in large numbers.

Armament consists of one 20mm cannon firing through the prop hub and 2 MGs on top of nose. It can carry three 56 lb rockets under each wing.

The latest development of this fighter is the LA-5, considered above, which fits a radial engine to the same airframe.

PE-3 (Designer: PEShyakov). A twin engine liquid cooled, low wing monoplane. Power plants are rated at 1050 hp each at 14,800 ft. Cruising speed 266 mph at 16,000 ft. Service ceiling is 27,500 ft with normal load.

Armament consists of 2 x 12.7mm fixed guns in the forward fuselage, 1 x 7.62mm mobile gun in the dorsal part of the fuselage and a 7.6 in the lateral part. Bombs are stored in the nacelles and rockets are carried outside. Later models are reported to have an even heavier armament.

This is a long range fighter developed from the PE-3 dive bomber, and is similar in appearance except for its enclosed nose, as against the PE-2's plexiglass nose.

GROUND ATTACK

IL-2 STORMOVIK (designer: Sergei ILiwushin). A single engine liquid cooled, low wing monoplane. Power plant is rated at 1600 hp at 6,800 ft. Normal cruising speed 235 mph at 7,000 ft. Service ceiling is 23,500 ft with normal load.

Armament consists of 2 x 7.6 and 2 x 23mm fixed guns in the wings, one 7.6 or 12.7mm mobile gun in the dorsal gunner's compartment back of the pilot. Experimental installation of 2 x 37mm guns is reported. There are two internal bomb-bays in each wing root. Bombs over 850 kilg and rockets are carried externally under the wings.

This is the most heavily armored plane in the world. The whole nose, cockpit and gunner's compartment are armored by 5 to 6.5mm armor plate. Windshield is made of 65mm bullet resisting glass. Armored shutter is protecting the radiator, while aircraft is in action.

It is the best known of all Soviet aircraft. It has been effectively used at low levels against ground targets.

Original models had wooden, fabric covered wings and tail. According to latest reports the newer models have metal wings.

SU-2. A single engine radial low wing monoplane. Power plant is rated at 1100 hp at 19,600 ft. Normal cruising speed 245 mph at 21,000 ft. Service ceiling 30,200 ft with normal load.

Armament consists of 4 x 7.6mm fixed guns in the wings and one 7.6mm mobile dorsal gun. Internal and external bomb stowage.

This is a low wall advertised but currently operational ground attack bomber. An improved version is known as the SU-3.

BOMBERS

PE-2 (Designer: PEShyakov). A twin-engine, liquid cooled, low wing monoplane. Power plants are rated at 1350 hp each at 13,500 ft. Normal cruising speed 248 mph at 13,500 ft. Service ceiling is 27,000 ft with a normal load.

Armament consists of 1 x 7.6mm and 1 x 12.7mm fixed guns in the forward fuselage. 1 x 7.6mm dorsal, 2 x 7.6mm lateral and 1 x 12.7mm ventral mobile guns. Bombs are carried both externally and internally.

This is one of the widely used operational light bombers. It has a long thin fuselage with twin fins and rudders.

SB-2. A twin-engined liquid cooled, low wing monoplane. Power plants are rated at 1050 hp each at 14,800 ft. Normal cruising speed 235 mph at 16,000 ft. Service ceiling is 28,000 ft with a normal load.

Armament consists of twin 7.6mm mobile guns in the forward fuselage, one or two 7.6mm mobile dorsal guns and one 7.6mm ventral gun. Bombs are carried internally.

This is one of the newest and most constantly used medium bombers. Subtypes SB-1 and SB-2 have engines which increase the speed to 250 mph at 15,000 ft and 260 mph at 16,000 ft respectively.

DB-3F or IL-4 (Designer: Sergei ILiwushin). A twin-engine, radial low wing monoplane. Power plants are rated at 1100 hp each at 19,700 ft. Normal cruising speed is 265 mph at 21,000 ft. Service ceiling is 30, 700 ft with a normal load.

Armament consists of one 7.6mm or 12.7mm mobile gun in the forward fuselage, one 7.6mm or 12.7mm dorsal mobile gun and ventral 1 x 7.6 or 12.7mm mobile gun.

This is one of the USSR's best bombers.

TB-7 (Designer: Tupolev). A four engine liquid cooled, mid-wing monoplane. Power plants are rated at 1200 hp each at 19,500 ft. Normal cruising speed 232 mph at 20,000 ft. Service ceiling is 24,000 ft with a normal load.

Armament consists of 2 x 7.6mm guns in forward fuselage, 2 x 12.7mm mobile guns in the nacelles, 1 x 20mm mobile dorsal gun and 1 x 20mm mobile tail gun. Turrets in tails of inboard nacelles, with a passageway through the wing to each turret. Main bomb stowage is internal.

This the best USSR heavy bomber and is widely used.

(The above material on Russian aircraft and the Russian Air Force was gathered by United States observers in the USSR during 1944 and 1945. Source: Ninth Air Force thru XIth Army Group.)

AAA WEEKLY INTELLIGENCE REPORT NO. 22

Period:
2000GMT 29 April to 2706GMT April

1. SUMMARY OF ACTION

a. Despite the mounting seriousness of his position on the ground, the enemy was able to launch but a lessening number of air sorties this week and even the most illiterate member of the Luftwaffe must have seen that the writing on the wall spelled "input". An estimated 180 enemy planes flew over the area in approximately 80 raids, most of which occurred the last three days of the period. In the forepart of the week, activity was mainly at night and consisted of small-scale nuisance strafing raids against headlighted traffic along MSRs, particularly Highways 4 and 26 (ASCHAFFENBERG-SCHWEINFURT-BAMBERG-NUERNBERG) and Highway 8 (ASCHAFFENBERG-WURZBURG-KITZINGEN-NUERNBERG). Targets along these routes such as troop assemblies, Class III supply points and the like also received nuisance attacks, and there were several attacks near LAUF (0-560708) upon similar targets. In addition, three airfields used in landing supplies were strafed in nightime efforts. The last three days saw activity jump sharply and on the final day of the period 80 E/A were over the area on bombing and strafing missions. Most of the latter attacks were along the left flank of the Army in XII Corps zone, the aircraft probably taking off from airfields located NE of there in the vic of PRAGUE. The 11th Armd and 26th Inf Divs and Corps Artillery bore the brunt of these attacks though several other divisions reported activity. And, indeed, throughout the week small flights of enemy planes appeared in all Corps sectors, reconnoitering troop movements and positions and in some instances making short, unaggressive attacks. Aircraft appearing

Digitized by Google

were standard types for the most part. Ju-88s, Ju-188s, He-111s and He-110s were frequently used at night and in the daytime Me-109s and FW-190s were used, with a sprinkling of Me-262s and quite numerous other types as Arado trainers, Me-108s and others. Refueled crews were undamaged and casualties reported were from gun operators and pilots of light attacking planes generally on low-level strafing missions.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	80	160	34	18
To Date	2,354	5,797	1,027	550

	P&C OVER AREA	P&C ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	3

2. GAF TACTICS NOTES

No new tactics were reported.

3. MISCELLANEOUS NOTES

a. Hostile activity was spread well over the area so that no individual battalion enjoyed much ample opportunities to score as existed in the previous few weeks. Elements of the 120th AAA Gun Bn were unusually employed in that they were attached to a combat command of the 11th Armd Div for antiaircraft protection, and in such employment had several engagements. From 0650 to 2325 hrs on 26 April, 16 E/A were engaged resulting in claims for 4 Cat Is and a Cat II. The 575th AAA Self-propelled, which is regularly attached to the 11th Armd Div, participated to a greater extent in the shooting and in a period from 2106GCOB to 2615B3OB Apr claimed 12 Cat Is and 4 Cat IIs materially deepening the dent in the Luftwaffe.

b. One recent afternoon, members of a gun section of the 693d AAA AW Bn idly observed several small German boys playing on an abandoned but intact 88mm gun in a section of the city of HOCHBERG. Closer attention was paid when it became apparent the children not only knew how to operate the gun but were earnestly breaking a friendly P-47 overhead. As crew members dashed for the gun the children ran hurriedly off, leaving the gun, which was found cocked and in perfect operating condition and contained a live round in the chamber. It is good to remember these things. When temptation arises to give these "harmless German children" chocolate or gum, remember — you may feed a child secretly planning to blow off your head. It has happened.

8 May 1945

AAA WEEKLY INTELLIGENCE REPORT NO. 40

Period:
2706GOB Apr to 0406GOB May

1. SUMMARY OF ACTION

a. The rapid disintegration of the German Air Force was typified by the aircraft engaged this week. The stricken beast, writhing in the throes of death, raised its head for a last gasp that spewed up almost the entire aircraft recognition handbook. In addition to ordinary Me-109s and FW-190s, the following types were reported: Ar-69, Ar-234, Ru-181, DO-217, Fi-156, FW-44J, He-111, He-126, He-177, Ju-52, Ju-87, Ju-88, Ju-188, Me-108, Me-210, Me-262. With these specimens, the Luftwaffe flew a rather considerable number of sorties, however, and made several attacks. On the morning of 27 April, approximately 30 E/A flew across XX Corps to enter the III Corps area and bomb and strafe infantry and armored elements. In doing so, these planes passed over the DANUBE River bridgeheads, newly established, for a complete reversal of previous tactics which would have called for attempts on the bridges. Other attacks during the week were made upon a crossing of the NAAB River, vic WERNBERG, ISAR River crossings, an airfield and vehicle assembly vic CHAM, convoys and other similar targets. Reconnaissance was rather extensive and E/A were reported over most division and corps elements and installations, as well as in rear of corps boundaries. Flights of 6 and 8 E/A were noted, though most raids were composed of single or, at most, 2 planes. Almost all activity occurred during daylight, with some occasional night flights.

b. Screening of reports has not been completed so that only estimated numbers of raids and E/A appear below. Totals for the week, and to date from 1 August 1944, are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	54	110	33	5
To Date	2,408	5,907	1,061	555

	P&C OVER AREA	P&C ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	168	31	0	3

2. GAF TACTICS NOTES

A summary of German air reactions as observed in XX Corps zone from 1 Feb to 25 Apr has been received from the 112th AAA Gp. It views air activity as falling into four distinct phases of ground operations by the Corps, the first of which, from 1 Feb to 16 Mar, is a semi-static period with the Siegfried Line from SAARLAUTERN to the SAAR-MOSELLE River confluence still to be overcome. Air activity at this stage of operations was as meagre as to merit no attention. As the offensive began, however, and the Siegfried Line was outflanked at TRIER and rapidly rolled South to KAISERSLAUTERN and beyond, a new stage (phase 2) of hostile air effort began with the GAF attacking convoys and leading tactical elements using 120 E/A in a period from 16 - 29 Mar. Enemy pilots were aggressive, but evasive when engaged by AAA. Clouds and haze were used to mask approaches and for evasion, violent aerobatics being resorted to on days with clear skies. RHINE River crossings were effected at MAINZ and this phase of operations (phase 3, 29 Mar - 3 Apr) saw activity almost double the previous period. GAF reaction was violent, not so much against bridges and bridge areas as against threatening advances of XX Corps armor and infantry. On 2 Apr, 185 E/A were reported over the Corps area. The final phase began 3 Apr with the drive E and E to a point 5 of CHEMNITZ, turning SE on 16 Apr to point on the line BAMBERG, NUERNBERG and widening to a point W of REGENSBURG. The Luftwaffe, no longer able to justify a policy of conservation, went into high gear and against the drive NE nearly trebled the sorties of the previous phase. E/A were overhead constantly, some forming large formations of planes. But hit-and-run tactics were used and there was no indication of the old college try, no do-or-die, in any of these attacks. Few, if any, attacks were pressed in the face of AAA fire and, once engaged, no planes returned for a second attempt. Indeed, a considerable number of pilots apparently flew only to acquire flight pay for sizable formations passed over good targets without dropping so much as a hand grenade. Jet-propelled A/C were used in larger proportions than before, but primarily in reconnaissance roles, with only occasional strafing. During none of these four phases was high altitude bombing reported.

3. MISCELLANEOUS NOTES

a. That all the odd type aircraft flown by the Germans were not as harmless as might appear, is indicated by the experience of the 120th AAA Gun Bn this week. Two Ha-18ls shot down contained loads of explosives and detonating caps (as well as a dead SS officer in one). Such occurrences were not uncommon elsewhere as revealed in the following quote:

"b. Airborne Sabotage. Recurring reports from XII and III US Corps of the discovery of explosives, caps and slow-burning fuse in crashed enemy liaison or training-type planes, plus information of captured German pilots, lays bare some of the details of the desperate last chance enemy plot to conduct organized sabotage in friendly areas by means of amateur airborne

"One German pilot captured by III Corps stated that his was the last of 40 planes flown by volunteer pilots, forming KOMMANDO WENNSTOCK, commanded by Col HERMAN, to take off from AIRRING Airport (Z-9926), W of SALZBURG on mission of sabotage. Pilots are said to carry papers stating that they are discharged from service upon completion of this mission. One pilot stated all planes were training-type HUECKERS-181s with top speed of 160 km per hr..... First US Army reported 3 May several pilots captured in rear areas central portion Army zone; 8 of these planes captured in past 2 days. Interrogation revealed that a unit called KOMMANDO VIENNSTOCK.....had mission of destroying bridges and railroads in Allied rear areas. Explosives were carried and the pilots, some of whom had missions vic their homes, were to proceed home when mission accomplished. According to FW, pilots may wear civilian clothes or GAF uniforms." (Source: TUSA G-2 Periodic No 527, 4 May)

b. With the foregoing black machinations furnishing sinister highlights, other doings of the training-plane pilots provide a romantic lustre bound to appeal to one and all:

"Reminiscent of World War I action was a claim recently awarded for a Piccolor Storch reconnaissance plane. An L-4 from the 71st Armd FA Bn....was flying over a column when they saw a FW-156 flying at tree top level below them. Circling down on the German plane they (pilot and observer) cut loose with their pistols and hit the gas tank....then dove on the Storch, forcing it to the ground where it hit a fence and was demolished. The L-4 landed nearby and captured the two occupants, one of whom had been wounded by the firing." (Source: Ninth US Army AAA ISUM No 31)

c. Yet another battalion has joined the ranks of those select few who shot down a plane with one round. At 0400 hrs on 3 May, a lone Ju-88 flying over positions of D Btry, 497th AAA AW Bn, circled and dove to strafe, heading directly for gun position No 6. The Chief of Section held fire until the range was short, then fired one round getting a direct hit that caused the E/A to burst into flame and crash nearby.

d. The 693d AAA AW Bn reported that 3 of their officers, missing in action since the ARDENNES breakthrough of December, were located in an enemy PW camp near MOOSBURG.

e. As reported briefly last week, two Btrys of the 120th AAA Gun Bn, with a provisional HQ supervising, were attached to the 11th Armd Div in an unusual employment. By lengthening the Btrys, one was always giving AAA protection for the armor and Div CP while the other was left behind to defend supply and service units in the rear against air attack. In ten days' time, the two Btrys moved 385 miles for an average of 38.5 miles per day, with no vehicles out of action due to any mechanical failure.

f. Another notation appearing in the Ninth US Army AAA Issue quoted above is of some interest, as indicating what might have been expected from the Luftwaffe had it been able to stay off the ground:

"Certainly the most interesting of the various airplane factories and airfields uncovered by the XIX Corps was the underground plane manufacturing the complete fuselage for the Me-163. This is a highwing, twin-tail fighter with a single turbo jet mounted above the wing. The crushed remains of one of these planes was located...although no claim was submitted nor was it seen in flight."

17 May 1945

AAA WEEKLY INTELLIGENCE REPORT NO. 41

LAST REGULAR REPORT

Period:
0600B May to 0900B May

1. SUMMARY OF ACTION

a. The last few days of the war in Europe passed with no final show of strength by the Luftwaffe. Its Air Marshal a prisoner, most of its planes grounded, its Bed-check Charlies a thing of the past, the German Air Force lived out its final days in comparative inactivity, waiting for rigor mortis. Its planes flew over in twos and threes making occasional half-hearted attacks, or sometimes loomed our airfields and landed. Often they were escorted by allied fighter craft. Areas of two regiments of the 26th Inf Div were strafed and bombed and DANUBE River targets via INGOLSTADT were strafed. On 8 May, FW-190s and Me-109s strafed DANUBE bridge areas via DEGGENDORF and PASSAU. In the latter attack enemy aircraft included two observation planes which, in a final gesture of defiance, fired "buzy" guns at ground targets. Only damage reported from these attacks was a slight injury to AAA fire control equipment caused by strafing.

b. Screening of all reports has been completed. Final totals for Third US Army operations from 1 August 1944 through 8 May 1945 are as follows:

	RAIDS	NO. E/A	CAT I	CAT II
Week	61	88	22	9
To Date	2,469	6,192	1,081	564

	PAC OVER AREA	PAC ENGAGED	CAT A	CAT B
Week	0	0	0	0
To Date	166	31	0	3

c. Ammunition expended upon its primary mission and in ground firing roles totaled as follows (number of rounds):

	90mm	90mm POZIT	40mm	37mm	.50 cal
AAA firing	56,314	1,531	91,688	63,254	3,797,127
Ground firing	26,245	0	12,607	13,143	1,425,886
TOTAL	82,559	1,531	104,295	76,397	5,223,013

2. GAP TACTICS NOTES

Nothing to report.

3. MISCELLANEOUS NOTES

a. In accumulating scores of 1,081 planes destroyed and 564 probably destroyed - a total of 1,646 - Third US Army's antiaircraft downed better than a fourth of all enemy aircraft observed over the entire Army area, for a percentage of 26.6%. In 281 operational days an average of 5.86 E/A were claimed each day. In addition to these many E/A were damaged.

b. It was on 1 August 1944 at 1458 hours - 2 hours and 25 minutes after Third US Army became operational - that AAA scored its first kill. The 465th AAA AW Bn attached to the 8th Inf Div opened fire on a flight of 15 - 20 Me-109s and knocked one down, the first of a long procession of planes to fall before AAA gun fire. To the 390th AAA AW Bn (SP) goes the distinction of shooting down the last. Three FW-190s were engaged at 2030B on May 8th - an hour and thirty-one minutes before hostilities officially ceased - as they flew over service elements of the 26th Inf Div. One smoked as the tracers caught it, then burst into flames and crashed.

c. In a notable occurrence of the week a chaplain captured a 1s General. While making arrangements to conduct mass in a local monastery the chaplain learned that the General, former CG of Wehrkreis XVII, was in hiding there. He promptly notified his CO and together they took the General prisoner. The chaplain is with the 653d AAA AW Bn.

d. For their many achievements antiaircraft units may well be proud. In particular it is most gratifying to record in these pages the official commendations of high commands for superlative work done in combat. It is noted with pride that of the AAA units serving with Third US Army, several have received a Presidential Unit Citation. For their heroic part in the defense of BASTOGNE under the direction of the 101st Airborne Div, "C" battery of the 628d AAA AW Bn (SP) attached to Res Command, 9th Armd Div, and "B" Battery of the 796th AAA AW Bn (SP) attached to CCB of the 10th Armd Div were awarded the unit citation. In addition, the entire 489th AAA AW Bn (SP) has been recommended by the 4th Armd Div to participate in the unit citation already granted to that division.

e. Attached as an inclosure is a tabulation of the "batting averages" of battalions, based on engagements and claims accruing while such battalions were attached or assigned to this Headquarters. Since all claims have not been finally processed, these do not represent the final figures, but do show increases over last week's report.

f. Also attached as an inclosure is a record of day-by-day enemy air activity over the entire Army area from the beginning of operations to date. These figures represent the screened totals, all duplications in reports of enemy planes having been eliminated so far as possible.

/s/ F. R. Chamberlain, Jr

HEADQUARTERS
THIRD UNITED STATES ARMY
Office of the Artillery Officer

SUBJECT: After-Action Report, Artillery Section, Headquarters Third United States Army.

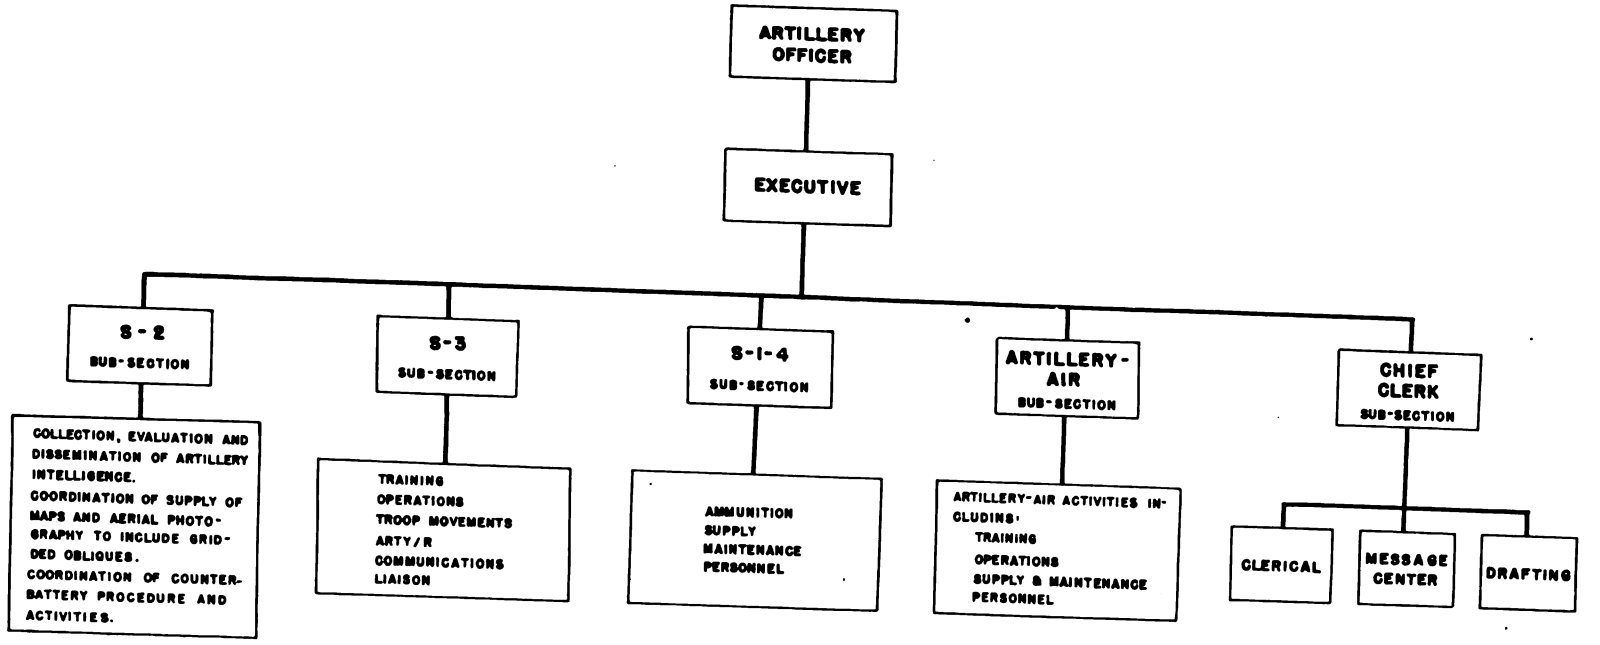
TO : Commanding General, Third United States Army.

1. Submitted herewith is the After-Action Report of the Artillery Section, Headquarters Third U.S. Army, commencing with 22 March 1944 and continuing at the properly designated intervals by chapters.

2. Third U.S. Army, and the artillery thereof, has operated over many varied kinds of terrain under strikingly diversified climatic conditions. There have been the narrow confines of hedgerows, the relatively open rolling plains, and the rough hills and precipitous valleys of wooded mountain country. There have been the dust of summer, the rains and mud of autumn and spring, the snows and biting cold of winter. There have been swift pursuits of fleeing enemy, repeated assaults of river lines great and small, assaults of defensive positions ranging from hasty field fortifications to the fortress city of METZ and the redoubts of the SIEGFRIED LINE. There have been resolute and unyielding defenses against counterattacks ranging from a handful of infantry with a tank or two to that of an Army Group including a Panzer Army.

3. Against all these conditions the infantry and tankmen of Third U.S. Army have built a record of magnificent success. To this record the artillerymen with the Army have contributed unceasingly and materially. They have consistently received the one real reward of the artilleryman, the appreciation of the supported troops expressed in the words "well done".

Edward T. Williams.



EDWARD T. WILLIAMS
Brigadier General, U.S.A.
Artillery Officer

DECLASSIFIED

ARTILLERY SECTION

Organizational and Functional Chart

CHAPTER 1
PLANNING IN UNITED KINGDOM

The Artillery Section, through its representation of two officers and two enlisted men in the advance party, commenced operations soon after their arrival in the United Kingdom on 28 January 1944. The main body arrived at the headquarters on 22 March. The Section then consisted of seventeen officers, one warrant officer and forty enlisted men. It was organized into four sub-sections, a combined S-1-4, S-2, S-3 and Artillery Air. In addition, there was a Tank Destroyer sub-section composed of attached personnel.

An initial and fundamental question was the determination of the initial disposition of the artillery with the Army. First U.S. Army was advised what artillery units, by caliber and quantity, would be available for assignment to Third U.S. Army. Subject to that limitation, artillery units were requested and included in the Third U.S. Army Troop List as follows:-

4 - Headquarters and Headquarters Batteries Corps Artillery
5 - Field Artillery Observation Battalions
2 - Headquarters and Headquarters Batteries Field Artillery Brigade
20 - Headquarters and Headquarters Batteries Field Artillery Group
12 - Field Artillery Battalions (105mm Howitzer)
8 - Armored Field Artillery Battalions
7 - Field Artillery Battalions (4.5-inch Gun)
19 - Field Artillery Battalions (155mm Howitzer)
10 - Field Artillery Battalions (155mm Gun)
3 - Field Artillery Battalions (155mm Gun, SP)
7 - Field Artillery Battalions (8-inch Howitzer)
4 - Field Artillery Battalions (8-inch Gun)
1 - Field Artillery Battalions (240mm Howitzer)

The employment of corps under the "OVERLORD" plan was necessarily subject to change. It was therefore considered desirable to attach a like quantity and caliber of artillery to each corps. The Field Artillery Annex to the Third U.S. Army Outline Plan accordingly recommended attachment to each of the four corps approximately the following artillery:-

1 - Headquarters and Headquarters Battery Corps Artillery
1 - Field Artillery Observation Battalion
4 - Headquarters and Headquarters Batteries Field Artillery Group
5 - Field Artillery Battalions (105mm Howitzer)
2 - Field Artillery Battalions (4.5-inch Gun)
5 - Field Artillery Battalions (155mm Howitzer)
3 - Field Artillery Battalions (155mm Gun)
2 - Field Artillery Battalions (8-inch Howitzer)

In addition, it was planned initially to retain the two field artillery brigades under Army control with the following artillery units:

REPRODUCED BY THE WAR DEPARTMENT FOR THE USE OF THE U.S. ARMY

Digitized by Google

4 - Field Artillery Group Headquarters
3 - Field Artillery Battalions (8-inch Gun)
7 - Field Artillery Battalions (24-pdr Howitzer)
4 - Field Artillery Battalions (105-mm Howitzer)

Much of the artillery to be assigned to the Army had still to arrive from the United States. As units arrived, reconnaissances were made to ascertain as to attachment to corps and as to location of camps and billets. So far as possible, subordinate units were located in proximity both to each other and the superior unit and in the vicinity of ranges and adequate training areas. Grounds, units were oriented and assisted in all matters of supply and distribution of continent administrative orders and commands was arranged through the Adjutant General.

All incoming units had to be equipped with field artillery liaison-type aircraft and their initial issue of Tables of Equipment Air Force equipment. This equipment was requested through and by the Artillery Section, which made the necessary arrangements with both higher headquarters and the Air Force and in turn notified the individual unit as to what items could be drawn and where and when to draw them. Replenishment supplies and equipment likewise were requisitioned through the Artillery Section. In addition, squadron code markings had to be assigned to all artillery aircraft with the Army and the units advised as to when and where to deliver the aircraft to the [illegible] Missile Reclamation and Repair Squadron which performed the work of marking.

Responsibility for the training of artillery units in the United Kingdom was delegated to the several corps. However, it was directed that they would [illegible] certain the following: thorough flight familiarization of all crews; review of basic training; familiarization with new material; calibration of all guns and howitzers; perfection of all specialists in their duties; waterproofing of materiel; service practice; long-range adjustment of artillery fire by high-performance aircraft (Thunderbolt replaced by the term "Arty/P"); counterbattery plans and procedure; operation with an observation battalion used in its normal role; technique of massing of fires with special emphasis upon Serenade (the massing of artillery fires); use of grid-to oblique photographs, night firing; communication to include operation in the Army and Corps Artillery Officer's Radio Nets; aircraft recognition; and defense against chemical attack, mines and booby traps.

In addition, the Artillery Section conducted a school to qualify unit instructors on the use of oblique photographs and assembled and furnished material for the conduct of unit schools. Provision was made for the training of tank destroyer and, in conjunction with the Anti-aircraft Artillery Section, antiaircraft artillery battalions in indirect fire methods.

Due to the widely varying dates of arrival in the United Kingdom, the varying stages of equipment and the difficulty of centralizing unit locations, training periods were staggered and of varying length. Nevertheless, almost all units were afforded at least one and often more opportunities to conduct service practice and firing exercises on the ranges and especially to calibrate weapons.

A number of artillery ranges were available in southern England and in Wales, some for the exclusive use of and under the control of Third U.S. Army, some for use in conjunction with First U.S. Army. The Artillery Section coordinated the use of these ranges by monthly allocations to corps. In addition, an officer from the Artillery Section was placed on temporary duty at Sennybridge Camp, South Wales in the vicinity of which most of the ranges were located. His task was to facilitate use of the range by the various units, including coordination of areas between units, supply of maps and aerial photographs, assistance in reconnaissance for positions and target areas, arrangements for Class I and III Supply of units on the ranges, liaison with the British District Headquarters and coordination with the local farmers. Three of the four corps were able to conduct a corps artillery firing exercise. In all, during the period April to June inclusive the ranges were utilized by more than 100 Third U.S. Army field artillery, tank and tank destroyer battalions.

Preparations for operations of course loomed importantly throughout the planning period. Included in these preparations was the Field Artillery Annex to the Army Outline Plan for "OVERLORD".

Operations Memoranda, copies attached, Annexes 1 - 6 inclusive, were prepared and published on Serenade, Special Basic Note for Artillery and Tank Destroyer Units, Observation of Artillery Fire by Fighter-Type Aircraft, Antitank Measures in Defense and Defense, Field Artillery Intelligence, and Field Artillery Communications and Reports. In addition, training memoranda relating to tank destroyer training, field artillery training for infantry, tank and combat engineer officers, and the use of range facilities were published. Arrangements were made with the Weather Detachment attached to Army and with the Antiaircraft Section for the furnishing of metro data to operations.

The Artillery Section, in conjunction with the Engineer Section, developed plans for operation of an Army Survey Information Center when practicable and a conference of field artillery observation battalion and engineer topographic battalion officers was held to assure proper coordination of their operational activities. The agenda for this conference is attached, Annex 7.

One officer and one enlisted man attended the Theater Intelligence Service School of Battle school and files on German order of battle, as pertinent to artillery units, were built up and maintained. Files were also accumulated on enemy artillery materiel and enemy defenses.

Air OP bulletins were initiated with the publication of Air OP Bulletin Number 1, 20 May, copy attached, Annex 8. (The term "Air OP is used herein to designate field artillery liaison-type aircraft.) Material included routine directives concerning operation of air sections and information on the operation and tactical employment of Air OPs in other theaters.

Ammunition, materiel and equipment for the operation likewise required constant attention through the planning period. After a study of ammunition expenditures in other theaters, recommendations were prepared and transmitted to the Army ammunition officer regarding quantities and types of field artillery ammunition to be requisitioned for the operation. Similarly, basic loads of types of ammunition and fuzes for each caliber weapon were determined, as follows:

WEAPON	PROJECTILE	FUZE*	PROPELLING CHARGE
105mm Howitzer	85% HE 15% Smoke (@ M7; @ T5 ML8) 5 Rounds WP/AT	50% PDF ML8 35% PDF MSL	
155mm Howitzer	50% HE 35% Smoke	72½% M51A1 [illegible] 2½% M54A1 7½% MSL	60% WB 40% SB
4.5-inch Gun	100% HE	70% M71A3 30% M54A1 10% M67A1	50% SC 50% MC
155mm Gun	55% HE 15% Smoke (WP)	10% M67A1 70% M71A1 30% M65A1	
8-inch Howitzer	100% HE	70% M71A3 30% M72A1 10% M67A1	70% WB 30% SB
8-inch Gun	100% HE	70% M51A3 10% T10* 10% M67A1	
240mm Howitzer	100% HE	70% M51A1 10% T10* 10% M67A1	

*Fuze proportions exceed 100% so as to provide a margin.

Subordinate units submitted many requests for equipment in excess of Tables of Organization and Equipment. These were studied to determine their merit and a consolidated field artillery project was prepared and submitted to the appropriate supply section of the headquarters. The more important of the items included in the project and subsequently authorized and issued to artillery units were as follows:-

SCR-193 radio, mounted in 1¼-ton truck - issued one per field artillery and tank destroyer battalion (less divisional and nondivisional), field artillery observation battalion, field artillery and tank destroyer group, and division artillery headquarters and headquarters battery, two per corps artillery headquarters and headquarters battery - for use in the Army and Corps Artillery Officer's Radio Nets.

1¼-ton truck and SCR-510, 608 or 610 radio - issued one per Air OP Section.

¼-ton weapons carrier - issued one per headquarters and headquarters battery, field artillery group, infantry and armored division artillery and corps artillery - for use by Air OP Section.

SCR-536 radio - issued four per field artillery battalion (divisional and non-divisional), field artillery observation battalion and headquarters and headquarters battery, division artillery - for use by Survey Sections.

Power Unit PE-75 - one per all field artillery and tank destroyer echelons, down to and including battalion - for lighting command post tents.

Wire W-110 - five miles per field artillery battalion (divisional and nondivisional) and field artillery observation battalion, twenty miles per headquarters and headquarters battery, field artillery group, division artillery and corps artillery.

In addition to the preceding, after analysis of similar requests by the North African Theater of Operations and by First U.S. Army, the Artillery Section initiated a request, copy attached, Annex 9, for personnel and materiel sufficient to provide an additional forward observer section for each light artillery firing battery and each medium artillery headquarters battery of the divisional artillery. The request was submitted through normal channels to European Theater of Operations and approved.

To secure uniformity of operational practices so far as practicable and so facilitate the transfer, when necessary, of artillery units from one army to the other, an officer was placed on liaison duty with the Artillery Section, First U.S. Army. He reported to First U.S. Army in early April and remained with it throughout its movement to the Continent, returning to Third U.S. Army in mid-July. Likewise, frequent contacts were maintained both with the Artillery Section, First U.S. Army Group and with the Artillery Sections of the several corps.

The initial plan for the lift of artillery units to the Continent was published by higher headquarters with a request that it be studied and changes recommended. First priority in the lift was given to divisions, next corps artillery units being given a low priority, so that in the main they were not scheduled for shipment until after the divisions. Subject to this limitation, the Artillery Section recommended changes in the initial troop list for the lift, notably the acceleration of several field artillery group headquarters so as to assure the presence on the Continent of sufficient headquarters to handle incoming battalions. The order of lift was kept under close scrutiny throughout the planning period and a few artillery units were moved back upon the initiative of either higher headquarters in the United Kingdom or in [illegible], a few moved ahead to meet specialized needs arising on the Continent.

The movement of field artillery liaison-type aircraft to the Continent raised a specialized problem. The Artillery Air Officer established a procedure whereby use of a prevailing airdrome and special overwater flight equipment were obtained and dispatch of a unit's planes by air was coordinated with the unit's movement by water. Instructions were also prepared and published for the truck loading of aircraft in the event that flight to the Continent should not be feasible.

The planning period came to an end with the lift of the Section to the Continent. This was made in two stages, the Section closing in the marshalling area on 29 June and on the Continent on 6 July. Three officers and six enlisted men were left behind in the United Kingdom to continue the Section's duties with respect to units scheduled for later shipment to the Continent and of which some had not yet arrived from the United States.

Meanwhile, several changes had taken place in the composition of the Artillery Section. In May, as part of a change in the Army Headquarters' organization, the Section strength was reduced to fourteen officers, one warrant officer and thirty-four enlisted men with a Tank Destroyer officer attached. Subsequently three enlisted men were released and replaced by radio operators. In June two additional officers, one first lieutenant and one second lieutenant, were assigned to the Section for duty in the Artillery Air sub-section. Thereafter, in July, an officer was designated to serve as Communications Officer paying particular attention to the Army and Corps Artillery Officer's Radio Nets.

One, and later three, aircraft were used continually by the Artillery Air sub-section. No mechanics nor maintenance equipment were available so that maintenance had to be performed by the pilot-crew or "borrowed" from lower units. This procedure was not considered satisfactory and was possible only because the aircraft were new.

CHAPTER 2
PRE-OPERATIONAL ON CONTINENT

The pre-operational period on the Continent was largely devoted to the reception and disposition of incoming artillery units as a part of the concentration of the Army for the operation.

An officer from the Artillery Section, with an officer assistant from 1st Tank Destroyer Brigade, and a detail of four enlisted men were stationed at the Utah Beach Transit Area from 5 July to 3 August. This

Digitized by Google

detachment acted as liaison between the Army and all incoming Army units and assisted the Army assembly.

DECLASSIFIED

The Artillery Section reconnoitered the artillery portion of the Army assembly areas and met incoming artillery units at the release point and guided them into their assigned bivouacs. Status of personnel and equipment was verified in each unit and, where necessary, action was initiated by the Section to alleviate shortages.

One field artillery observation battalion and one field artillery battalion, both assigned to Third U.S. Army, were attached to VIII Corps then operating in combat under First U.S. Army.

To prepare for the Army's entry into operations, close contact was established and maintained throughout the pre-operational period by personal visit with Twelfth U.S. Army Group, First U.S. Army and VIII, XV and XX Corps.

Of the three officers left in the United Kingdom upon the departure of the main body for the Continent, one rejoined the Section upon the arrival of Echelon V on 19 July. The remaining two officers stayed with Echelon I and did not rejoin the Section until late August. Their function in the United Kingdom was to assure the supply and equipping of Army units scheduled for later shipment to the Continent.

Several important supply problems were presented. A shortage of prime movers for 4.5-inch Gun, 155mm Howitzer and 155mm Gun battalions developed, so that a substitution of tractors in lieu of trucks became necessary. 4.5-inch Gun and 155mm Howitzer battalions were equipped with fifteen M5 tractors each, 155mm Gun battalions with eighteen M4 tractors each. A similar shortage of M21 and 10-ton ammunition trailers was alleviated by the issue of 4-ton and 2½-ton trucks as substitute equipment.

Track equipment for 155mm Gun (SP), 8-inch Howitzer, C-inch Gun and 240mm Howitzer battalions was unloaded at Liverpool, Manchester and Glasgow, often as much as three hundred miles from the unit's station. Such equipment was not capable of moving long distances on hard-surfaced roads because excessive wear of the tracks and bogies resulted. The Transportation Corps was able to move some of the smaller of this equipment by rail. Most of this equipment however was too high and too wide for rail movement. Two ordnance evacuation battalions were equipped with tank transporters and operated directly under the Artillery Section representatives to move this equipment to the units. They were also utilized to transport tanks and tractors to depots for major repairs.

Heavy artillery battalions required instruction and assistance in the maintenance of heavy equipment issued to them upon arrival in the United Kingdom. An ordnance heavy automotive maintenance company was equipped and operated under the Artillery Section representatives for this purpose. The experience of an 8-inch Gun battalion exemplifies the excellent work done by this company. This battalion, equipped with M5 tractors, was given a schedule requiring it to march 150 miles to the marshalling area in less than twenty-four hours. Upon arrival twenty-five bogie tires were found to be seriously damaged. The ordnance heavy automotive maintenance company commander personally procured and delivered replacements to the marshalling area within 24 hours and supervised their installation, thereby enabling the battalion to depart for continental operations as scheduled.

CHAPTER 3
AUGUST OPERATIONS

1 August. Third U.S. Army became operational at 1900, 1 August 1944. Annex 2 (Field Artillery), copy attached as Annex 10, to Field Order number 1 established the initial organization of the artillery. The situation everywhere was fluid, with VIII Corps commencing to fan out upon the BRITTANY PENINSULA and XV Corps advancing rapidly to the south, so that all artillery was attached to the several corps and none was retained under Army control.

VIII Corps, composed of two armored and two infantry divisions, initially had attached to it from Army one field artillery observation battalion, five field artillery group headquarters, one 155mm Howitzer battalion, three 105mm Howitzer (SP) battalions, five 155mm Howitzer battalions, three 155mm Gun battalions, one 155mm Gun (SP) battalion and one 8-inch Howitzer battalion. The Corps in turn reattached virtually all of its artillery to the divisions, its organization for combat being as follows:-

Attached to 8th Infantry Division -

1 field artillery group
1 105mm Howitzer battalion
1 155mm Howitzer battalion
1 155mm Gun battalion
1 field artillery observation battery

Attached to 79th Infantry Division -

1 field artillery group
2 105mm Howitzer battalions
1 155mm Gun battalion
1 field artillery observation battery

Attached to 4th Armored Division -

1 field artillery group
2 105mm Howitzer (SP) battalions
1 155mm Howitzer battalion

Attached to 6th Armored Division -

1 105mm Howitzer (SP) battalion
1 155mm Gun (SP) battalion

Retained under corps control -

2 field artillery groups
1 field artillery observation battalion (-)
1 155mm Howitzer battalion
1 155mm Gun battalion
1 8-inch Howitzer battalion

4th Armored Division was commencing its advance upon LORIENT (U72) at this time and 6th Armored Division was preparing to move upon BREST (V99).

XV Corps, composed of one armored and two infantry divisions, initially had attached to it from Army one field artillery observation battalion, four field artillery group headquarters, one 105mm Howitzer (SP) battalion, two 105mm Howitzer battalions, five 155mm Howitzer battalions, three 155mm Gun battalions and one 8-inch Howitzer battalion. Corps initially reattached one 105mm Howitzer (SP) battalion and one 105mm Howitzer (truck-drawn) battalion to 83d Infantry Division and one 105mm Howitzer battalion to 90th Infantry Division. The remaining artillery, while retained under Corps initially, moved so as closely to support the Corps advance and operated in effect much as if control had been decentralized to divisions.

XX Corps, in reserve initially, had attached from Army one field artillery observation battalion and two field artillery groups.

6th Armored Division reported that all six 105mm Howitzers (M7) of one battery were destroyed by fire from German 88s.

3 August. 79th Infantry Division replaced 83d Infantry Division in XV Corps. 83d Infantry Division replaced 79th Infantry Division in VIII Corps and began to move into position for the attack upon ST MALO (S71). Artillery attached to these divisions reverted to corps by Army order as soon as their missions could be taken over by other units.

4 August. XV Corps decentralized control of all artillery to the divisions to facilitate its movement in close support of the rapidly moving situation. Organization of the Corps artillery for combat was now as follows:-

Attached to 79th Infantry Division -

2 field artillery groups
1 105mm Howitzer battalion
2 155mm Howitzer battalions
2 155mm Gun battalions
1 8-inch Howitzer battalion

Attached to 90th Infantry Division -

2 field artillery groups
1 105mm Howitzer (SP) battalion
1 105mm Howitzer battalion
3 155mm Howitzer battalions
1 155mm Gun battalion

5 August. XV Corps continued to encounter limited resistance and little firing was done by the artillery with the Corps.

One field artillery group with two 155mm Howitzer battalions and two 155mm Gun battalions was attached to 83d Infantry Division by VIII Corps to support its attack on ST MALO (S71).

Ammunition expenditures by artillery with VIII Corps for the seven-day period ending at 050600 totalled 16,192 rounds 105mm Howitzer, 162 rounds 155mm Howitzer, fifty-three rounds 155mm Gun (SP) and nothing for both the 155mm Gun and 8-inch Howitzer, indicating that during a fast moving situation few calls for fire of the heavier weapons are to be anticipated.

DECLASSIFIED

6 August. A twenty-minute artillery preparation was fired by artillery with 83d Infantry Division in support of its attack on the main defense line around ST MALO (S71). The Division estimated that 6,000 troops were defending the area and reported receiving fire from enemy light artillery and mortars. Some Prisoners of War taken were carrying propaganda leaflets fired by 83d Division Artillery.

The Artillery Section arranged with the Weather Detachment attached to Army to obtain and broadcast metro messages four times daily.

Artillery ammunition was rationed to the Army by Twelfth U.S. Army Group. The Army however did not consider it necessary or desirable to impose rationing upon the several corps because of the light expenditures in the mobile situation and because it was desirable to assist the rapid advance by unrestricted ammunition expenditure when support was needed.

XX Corps was committed. No other artillery being available on the Continent, one 155mm Howitzer battalion and one 155mm Gun battalion, detached from VIII Corps, and one incoming 155mm Howitzer battalion were attached to XX Corps to support its advance. These were in addition to the one field artillery observation battalion and two field artillery groups previously attached to the Corps. Artillery with the Corps was supplemented by the attachment to it of incoming artillery units until by 10 August it consisted of one field artillery observation battalion, three field artillery groups, one 105mm Howitzer battalion, one 155mm Howitzer (SP) battalion, four 155mm Howitzer battalions, one 155mm Gun battalion and one 8-inch Howitzer battalion.

7 August. 83d Infantry Division continued to encounter stiff resistance at ST MALO (S71). Arty/A missions were arranged for the support of the attack.

8 August. 83d Infantry Division turned five captured German 150mm guns (pos U74 area) in ST MALO (S71). The Division reported receiving medium and heavy caliber artillery fire from heavy concrete emplacements upon the islands off ST MALO (S71).

XV Corps continued to advance, occupying LE MANS (V16). All artillery with the Corps continued to be attached to the divisions except for one field artillery group and three battalions in general support with the additional mission of reinforcing 79th Infantry Division.

9 August. VIII Corps Artillery (less attachments to 4th and 6th Armored and 8th Infantry Divisions) was committed in support of 83d Infantry Division attack at ST MALO (S71). This consisted of Headquarters and Headquarters Battery, VIII Corps Artillery, one field artillery observation battalion, three field artillery groups and eight field artillery battalions. Of these, one was a 155mm Howitzer battalion, two were 155mm Gun battalions, two 8-inch Howitzer battalions, two 8-inch Gun battalions and one 240mm Howitzer battalion.

Successful Arty/A missions in the ST MALO (S71) area included sinking of a two-masted ship in the harbor, a direct hit upon a building suspected of housing a command post and one adjustment upon an ammunition dump followed by explosions lasting thirty minutes.

Shortage of spare and replacement parts for M4 and M5 tractors was becoming critical in XV Corps.

11 August. Stern resistance at ST MALO (S71) continued. Artillery supporting the attack directed heavy fire against the Citadel (S7%4135). Unobserved counter-battery fire succeeded in silencing enemy batteries on the islands. Enemy batteries on the islands resumed firing immediately following aerial bombardment of the islands.

6th Armored Division Artillery fired counterfire successfully during aerial bombardment in support of limited objective attack at BREST (V99).

12 August. XV Corps reported that movement of the Corps had been so fast that it was difficult to keep aerial photographs ahead of the advancing units.

13 August. With the exception of isolated areas, enemy artillery resistance continued light. Enemy artillery was active at BREST (V99), LORIENT (U72) and especially ST MALO (S71) where fire was encountered from all calibers from 88mm to 210mm, including coastal guns turned around to fire inland. The advance north of the LOIRE and to the north and east encountered only sporadic fires from self-propelled assault guns and 88s.

Digitized by Google

VIII Corps employed heavy artillery extensively against the concrete fortifications at ST MALO (S771). In one blast 16,135 rounds from [illegible] blew a hole in the twenty-foot thick wall of a casemate. Concrete backed with armor plating, blew a twenty-foot hole in the turret cover and destroyed two 88mm guns emplaced in concrete turrets.

Ammunition expenditures continued light in all corps except VIII Corps which was expending approximately one-third of a unit of fire daily, mainly heavy caliber using CIOC (anti-concrete) rounds. Expenditures for the seven-day period ending at 12/2400 were as follows:-

	VIII Corps	XV Corps	XX Corps
105mm Howitzer	37619	10308	4965
155mm Howitzer	20093	361	1208
4.5-inch Gun	4784	58	0
155mm Gun (SP)	1352	-	-
8-inch Howitzer	1352	-	0
Railway Gun	None	12	-
240mm Howitzer	609	5	-

Air OPs, in addition to observation of fires, were used extensively during the first week for the reconnaissance for enemy installations and for artillery survey. Due to the nature of such operations results, in relatively high losses of both aircraft and pilots.

In anticipation of the commitment of XII Corps, one 155mm Howitzer battalion and one 3-inch Gun battalion were detached from XV Corps and one 155mm Howitzer (SP) battalion from VIII Corps, all being attached to XII Corps. Artillery with the Corps was augmented by the attachment of units arriving from the United Kingdom until by 31 August there were attached to XII Corps: one field artillery observation battalion, three field artillery groups, one 105mm Howitzer (SP) battalion, two 105mm Howitzer battalions, four 155mm Howitzer battalions, one 155mm Gun battalion and one 4.5 inch Gun (SP) battalion.

1st August. VIII Corps reported the silencing of all enemy batteries in the ST MALO (S771) area except those on the ILE DE CEZEMBRE (S7716).

1st August. Artillery with XV Corps, now closing in on the ARGENTAN (U21) - FALAISE (U12) gap and also advancing upon DREUX (R99), continued to be decentralized down to the divisions.

XII Corps was advancing west of ORLEANS (P62), encountering light opposition.

1st August. XX Corps Artillery, consisting of three field artillery groups (one 155mm field artillery battalion operating under Corps control), moved into position to fire in support of the Corps' bridgehead at CHARTRES (R36).

1st August. 2d French Armored, 80th and 90th Infantry Divisions, together with their attached XV Corps artillery consisting of a field artillery group, one field artillery observation battery, one 105mm Howitzer battalion, two 155mm Howitzer battalions and one 155mm Gun battalion, were detached and attached to First U.S. Army to exert pressure against and close the ARGENTAN (U21) - FALAISE (U12) gap.

Artillery remaining with XV Corps continued to move in close support of the advance of the 5th Armored and 7Cth Infantry Divisions to secure crossings of the SEINE RIVER in the vicinity of MANTES-GASSICOURT (R56).

XII Corps, advancing on the south flank of the Army, received considerable enemy artillery fire from positions in the wooded areas south of ORLEANS (P62). This fire continued on 1d and 19 August.

The Citadel at ST MALO (S71) capitulated. Its commander and his staff officers "were all at unanimous in stating that it was artillery fire, gradually reducing their defensive guns to a state of helplessness, that brought surrender...precisely all their guns were knocked out one by pre...by artillery, until they had no workable means of defense left."

VIII Corps submitted its estimate of additional heavy artillery needed to support its impending attack upon BREST (V79). It reported the presence there of at least eleven battalions of enemy artillery, most, 280mm and 155mm, including the artillery regiments of the 2Ld and 266th Infantry and 2d Parachute Divisions. It also reported that the coastal guns in the area had been turned inland. Enemy artillery fire to the area to date had been entirely harassing and interdiction.

1st August. XV Corps artillery attacked enemy barges on the SEINE, sinking four with an average expenditure of fifteen rounds per barge. Fires were observed by Air OPs.

1G August. 35th Field Artillery Brigade, one field artillery group, one 155mm Howitzer battalion and one 155mm Gun battalion, all newly arrived in the Continent, were attached to XII Corps to support attack on BREST (V79). Two field artillery groups were attached to XII Corps.

2G August. Seventeen replacement liaison aircraft arrived from the [illegible] depot, the first replacements received to date. 3 additional artillery replacement aircraft remained on order.

Ammunition expenditures for the seven-day period ending at 200600 were as follows:-

	VIII Corps	XII Corps	XV Corps	XX Corps
105mm Howitzer	7273	-	20033	2012
155mm Howitzer	2617	-	2435	506
155mm Gun	1260	-	2119	5
155mm Gun (SP)	1544	-	-	-
8-inch Howitzer	1202	-	213	14
Railway Gun	696	-	-	-
240mm Howitzer	109	-	55	-

21 August. XII Corps continued its easterly advance in the vicinity of ORLEANS (P62) and SENS (R66) with its artillery attached as follows:-

Attached to 95th Infantry Division -

1 155mm Howitzer battalion

Attached to 4th Armored Division -

1 field artillery group
1 105mm Howitzer (SP) battalion
3 155mm Howitzer battalions

General support, reinforcing 35th Division Artillery -

1 field artillery group
1 105mm Howitzer battalion
1 155mm Howitzer battalion

General support -

1 field artillery group
1 155mm Gun (SP) battalion
1 155mm Gun battalion

VIII Corps submitted its request for oblique photographic coverage and Arty/R missions in the impending attack upon BREST (V79).

Acute shortages of obturating parts, especially gas check pads, for medium and heavy caliber weapons were reported by all corps.

20 August. XV Corps secured a bridgehead over the SEINE at MANTES-GASSICOURT (R56), using the 79th Infantry Division. One field artillery group consisting of one field artillery observation battery, one 105mm Howitzer battalion and one 155mm Howitzer battalion was attached to the Division and the remaining Corps artillery, consisting of two field artillery groups, one field artillery observation battalion (-), one 155mm Gun battalion, one 8-inch Howitzer battalion and one 240mm Howitzer battalion, fired in close support of the operation. One 105mm Howitzer (SP) battalion and one 155mm Howitzer battalion were attached to 5th Armored Division to support its westward advance along the south bank of the SEINE toward LOUVIERS (R2289).

XV Corps artillery attached to First U.S. Army on 17 August during the reduction of the FALAISE gap (U71) - (U12) returned to Third U.S. Army. The field artillery observation battery was remttached to XV Corps. The field artillery group and four field artillery battalions were retained under Army control temporarily to coordinate their movement to an Army assembly area.

23 August. XX Corps artillery advanced in rear of 7th Armored and 5th Infantry Divisions in support of the seizure of MELUN (S2506) - MONTEREAU (S2712) bridgeheads over the SEINE. Corps artillery consisting of two field artillery groups and six field artillery battalions fired approximately 1,000 rounds in support of 7th Armored Division, including a ten-minute preparation in support of its attack. Two field artillery group and four field artillery battalions supported 5th Infantry Division but no fire other than that of the divisional artillery was requested or needed.

Four large caliber naval guns that were firing upon and delaying XX Corps' bridging operations were attacked and silenced with a Serenade of three volleys, fired by all artillery with the Corps.

VIII Corps announced its organization for the attack upon BREST (V). One 105mm Howitzer battalion was attached to 2d Infantry Division and one field artillery group, consisting of one 105mm Howitzer battalion, one 155mm Howitzer battalion and one 155mm Gun battalion was attached to Task Force B. All the remaining Corps artillery remained under Corps control with units given reinforcing missions. The Corps artillery consisted of one field artillery observation battalion, four field artillery groups, two 155mm Howitzer battalions, two 155mm Gun battalions, two 155mm Gun (SP) battalions, two 8-inch Howitzer battalions, two 8-inch Gun battalions and one 240mm Howitzer battalion.

24 August. XII Corps' advance reached the easterly limit of the area of 1/50,000 map coverage and the Artillery Section arranged for the delivery thereafter of a corresponding number of 1/100,000 maps to the artillery.

XV Corps and all Corps artillery were detached and attached to First U.S. Army.

25 August. VIII Corps attack upon BREST (V79) was launched, preceded by a great artillery preparation. A successful counterflak program was conducted in conjunct...n with the aerial bombardment. An Arty/R mission was fired upon ships attempting to evacuate BREST (V79), the pilot reporting great effect upon three ships and four others set afire. Fifty counterbattery missions were fired.

27 August. Replacement of liaison pilots presented a continuing problem, eight having been requisitioned to date but none received.

Ammunition expenditures continued light in all sectors except VIII Corps at BREST (V79) and at ST MALO (S71), where ILE DE CEZEMBRE (S7516) continued to hold out. Expenditures for the seven-day period ending at 270600 were as follows:-

	VIII Corps	XII Corps	XV Corps*	XX Corps
105mm Howitzer	39930	1319	11457	12968
4.5-inch Gun	747	-	-	-
155mm Howitzer	11706	663	2940	3197
155mm Gun	3665	-	784	601
155mm Gun (SP)	909	-	-	-
8-inch Howitzer	1436	81	397	166
8-inch Gun	234	-	-	-
240mm Howitzer	310	-	-	-

*Period ends on 24 August when XV Corps passed to First U.S. Army.

Obturating parts for medium and heavy weapons continued to be critically short. Attrition rates were high as to bogies for tractors M5. No replacement tractors M4 were available.

28 August. Of artillery units incoming to the Continent, one 105mm Howitzer battalion and one 155mm Howitzer (SP) battalion were retained under Army control temporarily to be attached to XV Corps upon its pending return to Army, one field artillery group, one 4.5-inch Gun battalion and one 155mm Howitzer battalion were attached to XX Corps and one 8-inch Howitzer battalion was attached to 83d Infantry Division to assist in the attack on the ILE DE CEZEMBRE (S7516). 35d Field Artillery Brigade arrived and was retained under Army control initially to administer Army artillery battalions temporarily on Prisoner of War duty.

29 August. At the request of 83d Division, Twelfth U.S. Army Group attached one 155mm Howitzer battalion from Third U.S. Army to it to support the attack on ILE DE CEZEMBRE (S7516). 83d Division, reported by this and its organic division artillery, captured ILE DE CEZEMBRE (S7516) on 1 September. Assistant G-3, 83d Infantry Division reported that 8-inch Gun shells had penetrated the concrete side walls (two meters thick) of the troop shelters and made them untenable.

Throughout the period. As one of the guiding principles in the attachment of artillery, it was sought to attach battalions as needed to the corps with which they had trained in the United Kingdom. The limited amount of artillery available on the Continent initially and operational requirements necessitated considerable departure from this principle so that, as additional units arrived, attachments were changed when feasible so as to permit the regrouping of units that had trained together. The guiding factor, however, was always the solution which would best support the accomplishment of the Army mission.

Confronted with the necessity of attaching units to PW escort duty, the Army initially assigned incoming units to this duty. These units were quickly relieved and made available for combat by the assignment to PW duty of three artillery battalions who were awaiting their basic weapons in the United Kingdom and who were brought to the Continent for this purpose.

Digitized by Google

The striking fact about the month's operations from an artillery standpoint was, with the exception of the assaults upon the fortress cities of ST MALO (871) and BREST (Y99), the high mobility of the action. Within the space of a month, Third U.S. Army swept on from the vicinity of AVRANCHES (T21) through LAVAL (X62), [illegible] (V16), ORLEANS (P42), CHARTRES (R30), DREUX (R33) and by the end of the month had effected crossings of the SEINE all the way from [illegible] to TROYES (V27) and was approaching the MARNE.

The artillery with the Army did much to assist in accomplishing these striking results. Despite the rapidity of the movement, the artillery was at all times able to maintain its position well forward. As a result, whenever resistance was encountered requiring the use of artillery, the artillery was present and ready for prompt and effective supporting action. Despite the distances involved, basic ammunition loads could be maintained so that at no time was there any real shortage of artillery ammunition to hamper the conduct of the operation. This was made possible partly by the relative lightness of ammunition expenditures as a whole, partly by the untiring efforts of the artillery supply elements and of Ordnance.

Throughout the highly mobile situation extensive use was made of artillery liaison aircraft for all types of communications and reconnaissance as well as the adjustment and surveillance of fires. A notable example occurred during VIII Corps' rapid advance down the west side of the COTENTIN (CHERBOURG) PENINSULA and its deployment across the base of and out upon the BRITTANY PENINSULA. Air OPs were assembled and operated under Corps control on 29 July to 6 August. Their mission was to seek out and report on friendly locations and movements, hostile installations and traffic, road and bridge conditions. Operation over hostile or disputed territory was often necessary so that some damage to materiel was incurred though all personnel escaped injury. On one occasion an Air OP located a tank ambush that was delaying our advancing column, thus enabling its destruction and resumption of the advance.

It was contemplated that in operations assuming personal contact, through the medium of staff visits, would be maintained with subordinate units. The mission of each visit was to secure the current organization for combat including locations down to and including battalion, to obtain all intelligence of an artillery nature, to ascertain ammunition expenditures and the status of personnel and equipment including any acute shortages, and to secure any pertinent information of a more general nature. Upon its return each visiting officer delivered an informal written report of the visit to the night duty officer. He in turn collated this information and prepared a report which was submitted to the Artillery Officer at 0800 daily.

In addition there was usually an official visit made daily to some unit by a member of the Artillery Section of Third U.S. Army representatives. This relief for contacts with the unit's Chief of Staff, G-2, G-3 and G-4, in addition to the artillery, and a verbal report to the Deputy Chief of Staff upon return.

During the fluid stages of the operation these staff visits were virtually the sole means of obtaining accurate and current information. Distances were generally too great for the SCR-193 radio nets and movements too frequent for wire communications to keep up.

The Communications Officer particularly concerned himself with the operation of the Army and Corps Artillery Officer's Radio Nets and, in addition, assisted subordinate units on communications problems in general. The fluid operation entailed great distances and rapid movement, making communications difficult. The Communications Officer accordingly spent much time with the corps artillery in order to assist them. At the request of the Army Signal Officer, the Artillery Section prepared and the Signal Section published radio call signs in SOI for all artillery and tank destroyer units, down to and including battalions, with the Army.

CHAPTER 4
SEPTEMBER OPERATIONS

1 September. XX Corps on the Army's north flank had secured REIMS (T27) and CHATEAU-THIERRY (T54), XII Corps had taken TROYES (V27) and secured the crossings of the SEINE at that point and both Corps were continuing their advance preparatory to attacking to secure crossings of the MEUSE. Despite the impending gasoline shortage, all artillery units were able closely to follow the advance. This was accomplished by towing to units only so much gasoline as was required to accomplish the move to the next selected position.

Air OPs disabling in front of our armor were attacked by enemy ground troops who had penetrated the lines in front of our advancing armor. Two aircraft were shot down but the third escaped and was able to warn the infantry of the enemy's strength and location. Air OP Bulletin Number 2 was published; copy attached, Annex 15.

All XX Corps artillery battalions displaced to positions generally two miles west of VERDUN (U26) to support crossing operations.

The attack of the 2d Infantry Division in the BREST (Y99) area was supported by a 45-minute artillery preparation fired by the organic Division Artillery reinforced by three Corps artillery groups having one 155mm Howitzer battalion, one 4.5-inch Gun battalion, two 155mm Gun battalions, two 8-inch Howitzer battalions, two 8-inch Gun battalions and one 240mm Howitzer battalion. Artillery with VIII Corps fired 570 missions, including 136 counterbattery missions, in the 24-hour period ending at 0600.

VIII Corps Artillery utilized a so-called "flash bang" counterbattery procedure that proved very effective in silencing enemy guns emplaced in strongly fortified positions. Single pieces, batteries and, occasionally, even battalions, when not actively engaged upon other missions, were kept laid on known enemy guns. All observation facilities, including ground, air, sound and flash, were coordinated to maintain constant surveillance of the enemy gun positions. Consequently, whenever an enemy gun opened fire it was quickly detected by the observer and the appropriate counter-weapon notified, resulting in prompt counterbattery fire that either destroyed the enemy gun or silenced it by driving its personnel to cover.

2 September. The gasoline supply situation became increasingly critical throughout the Army.

Of units newly arrived upon the Continent, one 240mm Howitzer battalion was attached to 33d Field Artillery Brigade, one 4.5-inch Gun battalion to XV Corps and one towed tank destroyer battalion to XX Corps.

XII Corps, with 80th Infantry and 4th Armored Divisions abreast, effected crossings of the MOSELLE in the vicinity of COMMERCY (N42). 196th Field Artillery Group, consisting of one 105mm Howitzer battalion, two 4.5-inch Gun battalions and one 155mm Howitzer battalion, operated in support of the 80th Infantry Division. 177th Field Artillery Group, consisting of two 105mm Howitzer (SP) battalions and two 155mm Howitzer battalions, operated in support of the 4th Armored Division and fired frequently upon enemy personnel and columns north and east of COMMERCY (N42).

In addition, XII Corps had placed in support of 35th Infantry Division, with a mission of protecting the south flank of the Army, one field artillery group consisting of two 105mm Howitzer battalions and two 155mm Howitzer battalions. The remaining Corps artillery, consisting of one field artillery group, two 155mm Gun battalions and one 8-inch Howitzer battalion, was retained and moved under Corps control because of the fluid situation.

XX Corps, with 7th Armored Division leading followed by the 5th Infantry Division, attacked and secured a bridgehead over the MEUSE at VERDUN (U26). One field artillery group of two 155mm Howitzer (SP) battalions and one 155mm Gun (SP) battalion reinforced the 7th Armored Division Artillery, two field artillery groups of one 4.5-inch Gun battalion and four 155mm Howitzer battalions reinforced the fires of the 5th Infantry Division Artillery and one field artillery group of one 155mm Howitzer battalion, one 155mm Gun battalion and one 8-inch Howitzer battalion fired in general support of the Corps. 90th Infantry Division and its organic artillery were in Corps reserve at REIMS (T57).

3 September. Shortage of gasoline gripped the entire Army with the result that all field artillery units were almost completely immobilized.

VIII Corps Artillery operated night Air OP patrols at BREST (Y99) but with slight success due to the fact that both pilots and observers were inadequately trained in night operations. Training in night operations in the United Kingdom had been planned but proved impossible due to unavailability of the necessary equipment.

VIII Corps received very heavy enemy artillery fire, particularly from 155mm weapons and from the coastal guns defending BREST (Y99). A high percentage of duds was noted in the enemy fire. Artillery with VIII Corps fired 407 missions in the 24-hour period ending at 0600, including 105 counterbattery missions and [illegible] harassing missions.

The seven-day period ending at 2400 on [illegible] was characterized by operations [illegible] with XII and XX Corps [illegible] and by very heavy firing by artillery with VIII Corps, heavily engaged in the reduction of BREST (Y99). Ammunition expenditures were as follows:

	VIII Corps	XII Corps	XV Corps*	XX Corps
105mm Howitzer	7814	5998	0	7302
4.5-inch Gun	2402	120	-	0
155mm Howitzer	2439	1067	0	502
155mm Gun	2942	0	0	15
155mm Gun (SP)	2402	-	-	-
8-inch Howitzer	2913	0	0	0
8-inch Gun	556	-	-	-
240mm Howitzer	795	-	0	-

*XV Corps reverted to Third U.S. Army on 30 August but was not committed during the period.

4 September. VIII Corps and all attached field artillery and tank destroyer units were relieved from assignment to Third U.S. Army. This included Headquarters and Headquarters Battery, VIII Corps Artillery, one field artillery brigade, two observation battalions, five field artillery groups, eighteen field artillery battalions, two tank destroyer groups and six tank destroyer battalions. In addition, the 1st Tank Destroyer Brigade was attached to Ninth U.S. Army.

The gasoline situation was improving and XX Corps was planning its attack to cross the MOSELLE. In anticipation thereof and to afford added support to the Corps effort, 33d Field Artillery Brigade was released from Army control and attached to XX Corps. At the same time one 155mm Gun battalion, two 8-inch Howitzer battalions and two 240mm Howitzer battalions were also attached to XX Corps. Of these, one 155mm Gun battalion and one 8-inch Howitzer battalion were relieved from XV Corps, one 8-inch Howitzer battalion was relieved from VIII Corps and the two 240mm Howitzer battalions were newly arrived on the Continent.

XX Corps issued its order for the attack on the MOSELLE, providing for the 7th Armored Division to lead followed by the 90th Infantry Division on the north flank and the 5th Infantry Division on the south flank. The artillery organization for support of the attack was as follows:-

General support, reinforcing 7th Armored Division - one field artillery group, consisting of two 155mm Howitzer (SP) battalions and one 155mm Gun (SP) battalion.

Attached to 5th Infantry Division - two 105mm Howitzer battalions.

General support, reinforcing 5th Infantry Division - one field artillery group, composed of two 155mm Howitzer battalions and one 4.5-inch Gun battalion.

Attached to 90th Infantry Division - one 155mm Howitzer battalion.

General support, reinforcing 90th Infantry Division - one field artillery group, composed of two 155mm Howitzer battalions.

General support - one field artillery group consisting of one 155mm Howitzer battalion, one 155mm Gun battalion and one 8-inch Howitzer battalion, and one field artillery brigade composed of one 155mm Gun battalion, two 8-inch Howitzer battalions and two 240mm Howitzer battalions.

XII Corps also launched its attack to secure crossings of the MOSELLE in the vicinity of PONT-A-MOUSSON (U73) and NANCY (U81). Strong opposition was encountered and considerable enemy artillery fire was received, mostly from single pieces.

6 September. XII Corps Artillery was organized to support the crossings of the MOSELLE in the following manner:-

One field artillery group, consisting of one 105mm Howitzer battalion, two 4.5-inch Gun battalions and one 155mm Howitzer battalion, together with two 105mm Howitzer battalions and one 155mm Howitzer battalion of the 90th Division Artillery fired in support of the 357th Infantry seeking to establish a bridgehead in the vicinity of PONT-A-MOUSSON (U73). One 105mm Howitzer battalion of the 90th Division Artillery, one 155mm Gun battalion and one 8-inch Howitzer battalion in Corps' general support, were supporting the position of the 358th Infantry, which, with a mission to cross the MOSELLE and clear the way for Combat Command A, 4th Armored Division to advance on NANCY (U81) from the northwest, and the 359th Infantry with a mission to cross the MOSELLE and advance on NANCY (U81) from the west.

The 357th Infantry attacked following a fifteen-minute artillery preparation that included seventy-two rounds fired by the 8-inch Howitzer battalion. The 357th Infantry succeeded in getting elements across the river but these were heavily attacked by enemy small arms, mortar and artillery fire that inflicted heavy casualties and forced a withdrawal to the west bank of the river. A 105mm Howitzer battalion operating in support of the 357th Infantry was attacked by enemy counterbattery fire and forced to displace to an alternate position. XII Corps also obtained sixteen enemy artillery locations or duds, all within a spread over a wide front. Enemy artillery activity was confined for the most part to interdiction and harassing fires, note it against our OPs.

DECLASSIFIED
DECLASSIFIED
Digitized by Google

One 240mm Howitzer battalion, newly arrived on the Continent, was attached to XII Corps. One incoming field artillery group was attached to XX Corps.

Ammunition shortages became increasingly critical. The Ammunition Supply Point in support of XX Corps had a fair supply with the exception of 4.5-inch Gun ammunition and all types of fuses, especially 210's. However, the Ammunition Supply Point in support of XII Corps was virtually devoid of all types of artillery ammunition and fuses.

7 September. An additional 240mm Howitzer battalion, newly arrived on the Continent, was attached to XII Corps.

Because of the wide Corps frontage, XII Corps established two Corps Artillery fire direction centers, one operating in rear of the north elements of the Corps and the other in rear of the south elements. Artillery with 90th Infantry Division, both organic and that attached by Corps, was regrouped so as to place four 155mm Howitzer battalions directly under Division Artillery in direct support of the Division and four 155mm Howitzer battalions under a field artillery group also in direct support of the Division. In addition, two Corps Artillery general support battalions had a secondary mission of reinforcing the 90th Infantry Division.

XII Corps attached one 105mm Howitzer (SP) battalion to the cavalry group operating in advance of the Corps with a mission to push on to LUNEVILLE (V09). In one instance this force encountered and attacked an enemy column, the cavalry attacking the front of the column and the artillery firing upon its rear. This combination destroyed thirty-six enemy vehicles and inflicted heavy casualties.

Despite inclement weather conditions, XII Corps operated a constant Air OP surveillance patrol over the entire Corps front.

XX Corps was advancing to the east preparatory to effecting crossings of the MOSELLE in the vicinity of THIONVILLE (V04) and METZ (V05). Increasing resistance was encountered as the advance approached the river and all Corps artillery was displacing forward to render close support to the attack. Meanwhile the advance to the east was increasingly threatened by enemy pressure against the exposed north flank of the Army.

6 September. An investigation was instituted by the Artillery Section, G-4 as to the number of rounds fired by every artillery piece with the Army, with a view to determining the extent of tube life remaining so that the necessity of replacement might be anticipated.

XV Corps Artillery was moving forward into an assembly area on the south flank of the Army. It consisted of an observation battalion, four field artillery groups, one 105mm Howitzer (SP) battalion, three 105mm Howitzer battalions, one 4.5-inch Gun battalion, four 155mm Howitzer battalions and one 155mm Gun battalion.

A mapping project of the SIEGFRIED LINE to a scale of 1/25,000 was initiated, involving 10,000 copies of each of 130 map sheets of which 2,000 copies would be overprinted with the known defensive installations. Four hundred copies of each overprinted sheet were requested for use of the artillery with the several corps.

An acute shortage existed of both M4 tractors and trucks. There was not a replacement truck larger than 3/4-ton available in the Army.

Two 155mm Gun battalions, both awaiting receipt of their primary weapons from the United States, and one towed tank destroyer battalion were presently assigned to Prisoner of War guard duty.

Strong resistance was encountered all along the MOSELLE front from METZ (V05) to NANCY (U71). Two separate areas of resistance to XX Corps became apparent, one to the north in the vicinity of THIONVILLE (V04) and the other south and in the vicinity of METZ. Enemy artillery activity was encountered in both sectors and notably so in the vicinity of METZ. Heavy counterattacks were encountered by 5th Infantry Division on the south flank of XX Corps and by 90th Infantry Division on the north flank of XII Corps.

9 September. The ammunition supply situation improved on all calibers with the notable exception of 105mm Howitzer ammunition which was critically short. Air shipment was requested in the priority 105mm Howitzer, 155mm Howitzer and 155mm Gun.

Very heavy opposition was encountered by both XII and XX Corps. One battalion of the 5th Infantry Division succeeded in crossing the MOSELLE south of METZ (V05) but was immediately pinned down by enemy artillery fire. 7th Armored Division also received heavy enemy artillery fire. Conversely, XX Corps Artillery did perhaps its most active firing to date, over 20,000 rounds being expended on 8 and 9 September. In one instance, one 240mm Howitzer battalion obtained six direct hits out of ten rounds fired on a fort in the METZ (V05) area and succeeded in starting fires. The enemy was making extensive use of the old forts around METZ (V05) and all lighter calibered weapons had proved ineffective against these defenses. 240mm Howitzer were also employed to attack and destroy an enemy airfield.

Because of the wide Corps frontage, Headquarters 33d Field Artillery Brigade was ordered to act as the Corps Artillery fire direction center in the southern half of the XX Corps sector while Headquarters XX Corps Artillery continued to perform this function in the northern half.

10 September. Ordnance maintenance echelons in support of XX Corps developed a successful field expedient for the repair of transmission failures on the M4 tractor. This went far to alleviate the critical shortage of this tractor.

Ammunition supply continued to be critically short, especially in rear of XII Corps. The weekly ammunition ration received from Twelfth U.S. Army Group allocated to the Army approximately one-third of a unit of fire per day in all calibers of artillery weapons.

XV Corps was committed on the south flank of the Army and ordered to secure a bridgehead over the MOSELLE, using the minimum force necessary to protect the south flank. One 155mm Gun battalion and one 8-inch Howitzer battalion were detached from XX Corps and one 240mm Howitzer battalion was detached from XII Corps, all being attached to XV Corps to support it in this operation.

Two tank destroyer battalions arrived on the Continent, thereby completing the lift of all field artillery and tank destroyer units with the Army.

35th Infantry Division, having been relieved by the combat of XV Corps, proceeded forward to rejoin XII Corps in its assault upon the MOSELLE. Activity in the Corps sector was relatively light and the artillery generally was displacing forward to support the Corps attack upon the FORET DE HAYE (U71) and NANCY (U81) on 11 September.

Enemy resistance in the XX Corps area continued strong and well organized. An enemy counterattack against the 5th Infantry Division was broken up by the fires of the 5th Division Artillery and the 33d Field Artillery Brigade.

All artillery with the Army stressed observed fires and held unobserved fires to a minimum in order to conserve ammunition.

Ammunition expenditures for the seven-day period ending at 061000 reflect both the continuing ammunition shortage and, especially in the METZ (V05) area before XX Corps, the strength of the enemy's defenses. Expenditures were as follows:-

	XII Corps	XV Corps*	XX Corps
105mm Howitzer	10627	73	30010
4.5-inch Gun	2510	0	842
155mm Howitzer	3017	0	6004
155mm Gun	1608	0	2100
105mm Gun (SP)	-	-	-
8-inch Howitzer	1074	0	1022
8-inch Gun	-	-	-
240mm Howitzer	-	0	87

*XV Corps was not committed until 10 September.

11 September. The ammunition situation continued critical but large incoming shipments due to arrive within two days were expected to relieve the situation.

Air OP patrols proved very effective in minimizing enemy artillery fire, it being found that enemy artillery, to avoid disclosing their positions, would not fire when our planes were in the air.

XII Corps launched the first phases of a coordinated attack. 90th Infantry Division on the north and 35th Infantry Division on the south were to secure bridgeheads over the MOSELLE and the MEURTHE in their respective zones. A task force was organized containing one combat team each from the 35th and 90th Infantry Divisions, to advance in the center and clear the FORET DE HAYE (U71). 4th Armored Division was to advance east on the extreme south flank and then turn north in an enveloping action.

To support this operation, one field artillery group consisting of one 105mm Howitzer battalion, two 4.5-inch Gun battalions and one 155mm Howitzer battalion, was assigned a mission of general support and reinforcing the fires of the 90th Infantry Division Artillery. One field artillery group of two 105mm Howitzer battalions and two 155mm Howitzer battalions was in general support and reinforcing the fires of the 35th Infantry Division. One field artillery group of two 105mm Howitzer (SP) battalions and two 155mm Howitzer battalions was in general support and reinforcing the fires of the 4th Armored Division. The remaining Corps artillery, consisting of one field artillery group, two 155mm Gun battalions, one 8-inch Howitzer battalion and one 240mm Howitzer battalion, fired in general support of the Corps.

Strenuous opposition was encountered, one enemy counterattack being broken up by our artillery fire and another reaching the outskirts of FORT PONT ST VINCENT (U79Q1), on the MOSELLE south of NANCY (U81), before being repulsed. Our forces nevertheless made good progress and the 134th Infantry succeeded in effecting a bridgehead over the MOSELLE southwest of NANCY (U81). Our artillery ceased to fire upon NANCY (U81), the city having been reported clear by the French Forces of the Interior.

12 September. The Army Photo Center opened in the vicinity of ST DIZIER (V96), this being the first time that it was located within range of the SCR-193 radio. One Army Artillery radio set was thereupon established at the Photo Center and the Army Artillery Officer's Radio Net operated for the first time as contemplated, that is, with one set each at the Army CP, the Photo Center and each Corps Artillery CP.

In the XII Corps sector, following a thirty-minute artillery preparation fired by the 90th Division Artillery and the reinforcing 4/4th Field Artillery Group, 90th Infantry Division attacked and effected a crossing of the MOSELLE south of PONT-A-MOUSSON (U73) with two infantry regiments. The artillery preparation was fired in barrage fashion against the east bank of the river. Considerable enemy artillery fire was directed at our forward elements and the bridgehead, especially the latter.

XV Corps continued its advance toward CHARMES (Z0576), on the MOSELLE. Some enemy artillery fire was received, mostly interdiction fires on the roads and shells from individual guns directed at our OPs. One liaison plane was destroyed on its landing strip by artillery fire from an enemy battery on the south flank that had been by-passed in the Corps' advance.

13 September. Combat Command A, 4th Armored Division crossed the MOSELLE, passed through the 90th Infantry Division and attacked to the east. It was supported by 4th Armored Division Artillery and also by one 105mm Howitzer (SP) battalion attached by Corps.

35th Infantry Division effected additional crossings of the MOSELLE southeast of NANCY (U81), the Division Artillery and one field artillery group of four battalions supporting the attack, primarily with observed fires directed by ground and Air OPs. Combat Command B, 4th Armored Division also effected a crossing of the MOSELLE to the west of the 35th Division, being supported by four battalions of XII Corps artillery.

Enemy artillery fire in the XX Corps sector was relatively light and was directed against our forward elements and the bridgehead. The bridge at NOVEANT (U7648) was partially destroyed by this fire.

14 September. XX Corps Artillery, still conserving ammunition for its projected attack, was firing approximately ninety-five per cent observed fires. The Corps estimated that it was opposed by between thirty and forty enemy artillery battalions, all 150mm or lighter caliber.

XX Corps Artillery issued its order for the support of the Corps' attack on 15 September, as follows:-

Attached to 90th Infantry Division - one 105mm Howitzer battalion.
General support, reinforcing 90th Infantry Division - two field artillery groups of three 155mm Howitzer, one 155mm Gun and one 8-inch Howitzer battalion and one antiaircraft artillery battalion (-).
General support, reinforcing 90th Infantry Division initially and later reinforcing the 7th Armored Division after it has passed through the bridgehead - one field artillery group of two 105mm Howitzer (SP) and one 155mm Gun (SP) battalion.
Attached to 5th Infantry Division - two 105mm Howitzer battalions.
General support, reinforcing 5th Infantry Division - one field artillery group, consisting of one 4.5-inch Gun battalion and two 155mm Howitzer battalions, and 33d Field Artillery Brigade, consisting of one field artillery group and one 8-inch Howitzer and two 240mm Howitzer battalions.

XX Corps Artillery activity was light as the bulk of the artillery displaced forward to support the attack. Photo interpretation teams attached to the Corps Artillery were proving to be of great value in locating enemy artillery.

In the XII Corps sector, severe counterattacks supported by tanks were launched against the 90th Infantry Division's bridgehead across

Digitized by Google

DECLASSIFIED

the MOSELLE. All the counterattacks were repulsed and fourteen enemy tanks were destroyed. [illegible] the course of these counterattacks, [illegible] 14th Field Artillery Observation Battalion was overrun and fought as infantry for six hours before being relieved.

Task Force Behrens moved into position east of TOUL (U61) to attack and clear the FORET DE HAYE (U71). One field artillery group of three battalions, in addition to its mission of general support of the Corps, was ordered to reinforce the Task Force.

One towed tank destroyer battalion was relieved from Third U.S. Army and assigned to Twelfth U.S. Army Group.

15 September. XX Corps launched its attack supported by a two hour and fifteen minute artillery preparation. 5th Infantry Division was to expand its bridgehead south of METZ (U85) following which the 7th Armored Division was to pass through and press the attack. 90th Infantry Division was to contain THIONVILLE (U88) and clear the west bank of the MOSELLE. Enemy artillery reaction to the attack was active and was directed particularly against the forward elements of the 90th Infantry Division and against the bridge at NOVEANT (V7664L8).

In the XII Corps sector, NANCY (U81) fell, Combat Command A, 4th Armored Division having swept down from the north on the east side to encircle the city. Both the 35th Infantry Division and Combat Command B, 4th Armored Division effected crossings of the MEURTHE east of NANCY (U81). Little enemy artillery fire was encountered and our artillery activity was moderate. An interesting incident occurred when an 8-inch Howitzer battalion commander happened upon an infantry battalion commander to whom no artillery support was available at the moment. As a result the 8-inch Howitzers fired several missions in direct support of the infantry.

16 September. The general artillery ammunition supply situation, with the exception of 4.5-inch Gun ammunition and T105 fuzes, was more satisfactory than it had been for some time as a result of incoming shipments. That the shortage had been maintained at the critical level and had never become dangerous could be attributed only to the continued close supervision of expenditures by all artillery commanders and to the diligent and unceasing efforts of Army and subordinate ordnance echelons.

An increase in the current ration of 8-inch Howitzer and 240mm Howitzer ammunition was requested and received from Twelfth U.S. Army Group, most of the increase being allocated to XX Corps. XX Corps asked and received authorization to exceed its ration of 155mm Howitzer ammunition, no change in the Army overall ration being necessary due to the relatively light expenditures of this caliber by both XII and XV Corps.

There was considerable artillery activity in XX Corps with the number of counterbattery missions fired by our artillery increasing daily. 7th Field Artillery Observation Battalion had obtained a total of forty-three sound locations and forty-two flash locations in the METZ (U85) area to date. Enemy artillery was especially active in response to the Corps attack and used battalion concentrations for the first time. Much of the enemy artillery was emplaced in the forts surrounding METZ (U85) so that a direct hit upon a relatively small opening was necessary for effective neutralization.

The Corps artillery marked six targets east of METZ (U85) with two rounds of smoke each for attack by our bombers. A counterflak program was conducted by the artillery coincident with the air attack.

In the XII Corps the 90th Infantry Division attacked and succeeded in relieving the 3d Battalion, 315th Infantry which had been isolated beyond ST GENEVIEVE (U8134) for several days. Twenty thousand rounds of small arms ammunition had previously been dropped to this battalion by liaison pilots of the 80th Division Artillery. Five artillery battalions fired four time-on-target concentrations upon enemy assembly areas at the request of the 80th Infantry Division Commander. A shaking enemy counterattack against the Division was broken up by the massed fires of the Division Artillery coordinated with air support.

XV Corps was employing one heavy antiaircraft artillery battalion in a field artillery role. Two counterattacks by infantry and tanks against the 2d French Armored Division at CHATEL-SUR-MOSELLE (V7099) were supported by heavy enemy artillery fire. Both counterattacks were repelled, one being broken up by the artillery fire of the 2d French Armored Division Artillery. 79th Infantry Division encountered little or no enemy artillery opposition.

17 September. Although enemy artillery in the XX Corps sector remained silent for long periods at a time, the forts around METZ (U85) had proven virtually impregnable to our artillery fires and were still capable of heavy and effective fire. In an effort to neutralize the VERDUN GROUPE (V7950) of forts, the Corps allotted a 155mm Gun (SP) battalion the sole mission of maintaining continued fire upon this group, allocating 500 rounds of ammunition for the purpose. This program proved so successful that it was thereafter repeated at the request of 5th Infantry Division. In addition, one 155mm Gun (SP) was moved into position for direct fire upon the fort. Additional 155mm Guns (SP) were subsequently employed in the same manner against DRIANT (V7753) and other forts.

35th Division Artillery moved forward preparatory to crossing the MEURTHE and Corps artillery supporting the Division remained in position south of the MEURTHE firing into the sector from LUNEVILLE (V09) on the east to NANCY (U81) on the west.

Ammunition expenditures for the seven-day period ending at 170600 reflect the generally heavy fighting, both XII and XX Corps having done their heaviest firing to date. The figures are as follows:-

	XII Corps	XV Corps	XX Corps
105mm Howitzer	4,0800	18944	4,0963
4.5-inch Gun	4901	154	1876
155mm Howitzer	12271	1389	10845
155mm Gun (SP)	1996	190	839
8-inch Howitzer	-	-	881
8-inch Gun	985	77	1863
240mm Howitzer	422	52	1195

18 September. XX Corps reported increasing enemy artillery activity, especially from FORT JEANNE D'ARC (V7658) and including concentrations of as many as fifty rounds. It was found that even 240mm Howitzers could do no more than temporarily neutralize the forts. 8-inch Howitzers attached and destroyed two enemy railroad trains, near METZ (U85). Fifty per cent or more of the Corps' missions were unobserved fires due to poor visibility.

XII Corps prepared to attack to the northeast with the 4th Armored Division leading, followed by the 35th Infantry Division. Three field artillery battalions, and a part of a fourth, were to be temporarily immobilized in order to provide trucks to motorize the 35th Division. A task force consisting of one combat command, 6th Armored Division and one combat team, 35th Infantry Division was organized to clear the woodland area north of NANCY (U81).

19 September. Enemy artillery activity was light in the XX Corps area, less than 200 rounds being received over the entire front and most of that being directed against the 90th Infantry Division. Corps initiated a program of sharply restricting ammunition expenditures in order to build up a reserve for future operations.

7th Armored Division repulsed a sharp counterattack in its bridgehead east of the MOSELLE. Two Corps artillery battalions were employed east of the MOSELLE to fire in close support of the Division.

Enemy artillery activity was likewise light throughout the XII Corps sector. XII Corps artillery was reasonably active however and no less than seventeen time-on-target missions were fired, mostly in support of 80th Infantry Division. In addition, three sound-on-sound adjustments were fired, in each case the adjustments being followed by a time-on-target concentration fired by four battalions.

20 September. Enemy artillery became active again before the XX Corps, especially against the 5th Infantry Division and 7th Armored Division. Some enemy concentrations numbered as many as sixty rounds. Very little of the fire came from the forts however and the 155mm Gun (SP) emplaced for direct fire upon the forts was achieving good neutralization results.

An Air OP adjusted the fire of XX Corps artillery upon and destroyed one of our liaison planes that had been grounded in enemy territory.

In the XII Corps zone enemy artillery [illegible] very active again, notably against the 80th Infantry Divi[illegible] percentage of duds was encountered in the enemy shells [illegible] Division sector a plan of defensive fires was [illegible] roadblocks to the south and southeast.

DECLASSIFIED

21 September. An enemy counterattack against the 5th Infantry Division was preceded by an artillery preparation of over 300 rounds. XX Corps was conserving all ammunition possible in 90th Infantry Division in order to balance the heavy demands of artillery firing in support of 5th Infantry and 7th Armored Divisions. A sound and flash base was installed east of the MOSELLE in an effort to locate the artillery firing upon these two divisions.

In the XII Corps moderate enemy artillery fire was directed against our OPs and forward elements and there were some indications that the enemy was commencing to withdraw into the FORET DE PARROY (Q10).

XV Corps encountered heavy resistance in the vicinity of LUNEVILLE (V09) and received the heaviest enemy artillery fire that had yet been directed against it. Harassing fires and battery concentrations fell east of LUNEVILLE (V09) and heavy fire was received at FLIN (V2009), on the MEURTHE, and on the river crossing. A 105mm Howitzer (SP) battalion was attached to 2d French Armored Division.

Repeated Prisoner of War interrogations continued to attest the high effectiveness of our artillery fires.

22 September. Nine aircraft and ten pilots were received and assigned to subordinate units. A balance of four aircraft and ten pilots remained on requisition.

Replacement tubes for 105mm Howitzers arrived in quantity and early delivery was expected of replacement tubes for other calibers.

XX Corps experienced reduced enemy artillery activity and held its own firing to a minimum so as to conserve ammunition for the projected attack upon FORT DRIANT (V7753). A coordinated counterbattery program was instituted whereby active enemy locations were attacked simultaneously. On one occasion nine battalions fired upon twelve locations at the same time.

Heavy artillery, 8-inch Howitzers and 240mm Howitzers, of the 35d Field Artillery Brigade fired repeatedly in close support of the 7th Armored Division, the heavy effect of these weapons being well suited for driving the enemy out of positions in buildings. The accuracy of the 8-inch Howitzer made this weapon especially suitable for firing in close support of the leading elements.

The enemy shelled XX Corps' bridge over the SEILLE RIVER with a heavy concentration of mortar and artillery fire.

Enemy artillery was very active in the XII Corps sector. There continued to be frequent reports of many enemy duds. Examination of enemy shell fragments proved them to be of an inferior cast steel construction rather than of forged steel.

XV Corps had heavy enemy artillery fire throughout the Corps zone and especially so at LUNEVILLE (V09) and at the 2d French Armored Division's bridgehead at FLIN (V2089). Thirteen enemy locations were obtained, mostly through photo interpretation or sound.

23 September. One towed tank destroyer battalion closed in the Army area and was attached to XII Corps.

Enemy artillery activity dropped off before XX Corps but showed a marked increase before XII Corps, especially in the southern part of its sector, and before XV Corps. The last continued to encounter very heavy fires at LUNEVILLE (V09) and at the 2d French Armored Division's bridgehead, including one sixty-round concentration. Sound locations established a large concentration of enemy artillery in the southwestern part of the FORET DE PARROY (Q10).

XX Corps Artillery estimated that the enemy was utilizing for the defense of METZ (U85) and its environs, thirty-seven 150mm Howitzers, ninety-seven 105mm Howitzers and Guns, twenty-five 80mm Guns, forty-two 75mm Guns, twenty Infantry Howitzers and thirty Antitank Guns. Of these, Corps counterbattery fire was believed to have destroyed, for the most part by observed fire methods, nine 150mm Howitzers, twenty 105mm Howitzers and Guns, nineteen 88mm Guns and twenty-four 75mm Guns.

A system was instituted whereby in advance of all Arty/R missions, the pilot was briefed by a Corps Artillery Assistant S-2 and was given, when available, a vertical photograph with a 100-yard superimposed grid, one axis of the grid paralleling the Gun-Target line and the other axis being perpendicular thereto at the target. This system was found to enhance both the rapidity and accuracy of adjustment. Also, whenever, possible, one battalion of field artillery was made available to the pilot that he might attack and destroy active enemy antiaircraft guns.

Air OP activity had been sharply restricted for a week or more because of adverse weather conditions, low ceilings and short visibility.

Artillery with XV Corps was being employed as follows:-

Attached to 79th Infantry Division - two 105mm Howitzer battalions.
General support, reinforcing 79th Division Artillery - one field artillery group of two 155mm Howitzer battalions.
General support, reinforcing the preceding field artillery group - one field artillery group of two 155mm Gun battalions.
Attached to 2d French Armored Division - one 105mm Howitzer battalion, one 105mm Howitzer (SP) battalion and one 155mm Howitzer battalion.

Digitized by Google

General support, reinforcing 24 French Armored Division - one field artillery group of one 8-inch Gun battalion and one 155mm Howitzer battalion.

General support reinforcing the preceding group - one field artillery group of one 8-inch Howitzer battalion and one 240mm Howitzer battalion.

24 September. Substantial shipments of gas check pads and split rings for the 155mm Howitzer and of 8-inch Gun tubes were received, all of which has been critically short.

One towed tank destroyer battalion closed in the Army area and was attached to XX Corps.

7th Armored Division was withdrawn from the front into an assembly area preparatory to being relieved from the Army. Corps artillery previously reinforcing the 7th Armored Division - one field artillery group of two 155mm Howitzer (SP) battalions and one 155mm Gun (SP) battalion, as well as the division artillery of support and reinforcing the fires of the 5th Infantry Division Artillery.

A strong enemy counterattack was launched against the 4th Armored Division. It was broken up and repelled by artillery fire coordinated with aerial attack.

42d Field Artillery Observation Battalion's flash base in the XII Corps sector located an enemy infantry and artillery assemblage. One 105mm Gun battalion and one 8-inch Howitzer battalion were adjusted and fired two volleys. Three days the enemy reassembled and three days he was dispersed by two volleys from the two battalions. Widespread destruction was the result, with many enemy dead and wounded.

Ammunition expenditures for the seven-day period ending at 240600 reflect the continued strong defense encountered by XII and XX Corps and the stiffening resistance met by XV Corps as it drew forward on the south flank of the Army. Expenditure figures were as follows:

	XII Corps	XV Corps	XX Corps
105mm Howitzer	17610	21770	41667
4.5-inch Gun	2711	115	241
155mm Howitzer	7.42	5241	5597
155mm Gun	2096	1691	1106
155mm Gun (SP)	-	-	2003
8-inch Howitzer	1175	269	1277
8-inch Gun	-	-	-
240mm Howitzer	191	171	405

25 September. The ammunition ration for the period 26 September to 1 October was received from Twelfth U.S. Army Group and proved to be the most generous that Third U.S. Army had yet enjoyed. Twelfth U.S. Army Group allocated 8,000 T105 fuses to the Army.

XII Corps maintained neutralizing fires on FORTS DRIANT (U7753) and CHANVE D'AVE (U7756) on a twenty-four hour basis. One hundred fifty-five rounds of 155mm Gun, 100 rounds of 240mm Howitzer and twenty-five rounds of 240mm Howitzer ammunition were fired on FORT CHANVE D'AVE (U7756). A number of direct hits were obtained on the casemates, two being destroyed, and an ammunition dump was exploded. A total of 100 rounds of 155 mm Howitzer was fired upon this concrete shelters and casemates of FORT FRIEDMANN (U7854), ship; concrete was the sole result.

All XII Corps artillery was operating under Corps control, none being attached to the divisions. Three field artillery groups of four battalions each had missions of general support and reinforcing the 80th Infantry, 5th Infantry and 4th Armored Divisions respectively. One field artillery group of three battalions had a general support mission covering the northern part of the Corps front. Two battalions had a general support mission covering the southern part of the Corps front and a field artillery group headquarters acted in the role of a second corps artillery fire direction center in this area.

80th Infantry Division launched a limited objective attack. XII Corps artillery supporting the division fired time-on-target concentrations on all known active enemy artillery locations in the sector.

A considerable increase was noted in the amount of enemy artillery opposed to XV Corps and it was very active. Heavy fires were received, as much centered on our bridge at PONT (U7049) that our engineers were forced to withdraw their equipment. XV Corps artillery fired twenty-three counterbattery missions in all and a considerable reduction in the enemy's artillery activity was noted.

26 September. Letter of Instruction Number 4, Headquarters Third U.S. Army, 26 September 1944, directed that all possible sources of enemy tank data be registered in by all guns with the Army and direct of the Artillery Officer to effect the necessary coordination and to provide the completed information to the Commanding General, XIX Tactical Air Command so as to provide for aerial coordination as well. The necessary directive was prepared and delivered to the Artillery Commanders of XII, XV and XX Corps by artillery liaison plane courier on 26 September. A copy of this directive is attached as Annex 12. The completed maps, in overlay form, showing all avenues of tank approach and the mustered concentrations thereon, were delivered to the XIX Tactical Air Command. Each division and corps was required to deliver ten copies of its overlays to all adjacent divisions and corps.

90th Infantry Division launched an attack on strong points east of JEANDELIZE (U7747), near METZ (OOS). All objectives were secured within three hours. XX Corps artillery supporting the Division fired the normal preparation and supporting missions.

Over 1,000 enemy rounds were fired upon the bridge below NOMENY (U7645) and finally destroyed it. This fire came both from emplacements within the forts and from field places. XX Corps artillery fired thirty-seven counterbattery missions, for the most part unobserved.

35th Infantry Division was committed on the north flank of the Corps in the LUNEVILLE (U61) area. One infantry regiment, supported by three organic artillery battalions, was engaged in clearing BENAMENIL (LC1060).

Strong opposition developed along the entire XII Corps front. Strong resistance and several counterattacks were experienced by 90th Infantry Division and Corps artillery supporting the Division fired ten time-on-target concentrations.

Both the 35th Infantry and 4th Armored Divisions encountered infantry and armored counterattacks, strongly supported by artillery. The enemy fired no less than 225 rounds into the town of ARRACOURT (Q3174) alone. Ten time-on-target concentrations were especially effective in repelling a strong counterattack against Combat Command B, 4th Armored Division and heavy artillery fire assisted in breaking up counterattack against the 4th Armored Division. The enemy was causing his armor north and west of the FORET DE FARAGUT (Q3C) and the 11th Panzer Division was identified in that area.

XV Corps experienced a sharp decline in enemy artillery activity. The Corps artillery fired 2141 missions, almost entirely on a harassing or interdiction nature and of which all but nine were unobserved. Ten counterbattery missions were fired on a total of six active enemy locations. Only minor changes occurred in the organization for combat of XV Corps Artillery, the most notable being that one heavy antiaircraft artillery battalion and one tank destroyer battalion were both being employed in their secondary role as artillery.

27 September. XX Corps experienced an increase in enemy artillery fire, especially from positions within the forts. DRAVEGNIE (U7748) continued to receive much of the enemy's attention, over 500 rounds having fallen on the town within a three-day period. Our artillery continued its neutralization fires against FORT CHANVE D'AVE (U7756) with good effect. Over 100 rounds of 240mm antiaircraft artillery time fire were directed against infantry entrenched in the environs of this fort.

All Corps experienced violent enemy artillery and armored activity. One concentration of forty rounds fell in the 90th Division sector and the 4th and 10th Armored Divisions and three Corps artillery battalions all received heavy artillery fire.

All Corps Air OPs materially assisted the advance of two of our tank columns by patrolling the forward areas and reporting the locations of dug-in enemy tanks by means of dropped messages.

28 September. Pursuant to its request, Twelfth U.S. Army Group was advised that Third U.S. Army wished to reorganize six towed tank destroyer battalions into self-propelled M36 battalions as and when the equipment therefore became available.

Enemy artillery activity in the XX Corps sector reverted to what was considered as "normal", approximately 350 rounds falling over the entire Corps front. The enemy counterattack was broken up by the massed time-on-target fires of the 90th Infantry Division Artillery and four supporting Corps artillery battalions.

5th Infantry Division utilized Air OPs to assist in bombing missions, observing for effect upon the proper targets and even effecting corrections during the course of the missions. Communications were established via Division Artillery and Air Support Party radio channels.

One battalion of the 5th Infantry Division launched an attack against FORT DRIANT (U7753) that was preceded by an artillery preparation fired by 5th Division Artillery and the supporting Corps artillery. The attack reached the moat surrounding the fort before being compelled to withdraw.

29 September. XV Corps, together with 79th Infantry and 2d French Armored Divisions and all attached artillery units, was relieved from attachment to Third U.S. Army. Included therein were Headquarters and Headquarters Battery, XV Corps Artillery, one field artillery observation battalion, four field artillery groups, thirteen field artillery battalions, one tank destroyer group and two tank destroyer battalions.

A [illegible] Tank Destroyer Brigade, one field artillery observation battalion and one 8-inch Gun battalion were relieved from attachment to Ninth U.S. Army and reverted to Third U.S. Army. The observation battalion was thereupon remitached to XX Corps.

4th Armored Division reported an interesting employment of its Air OPs. The advance of each combat command was habitually preceded by an Air OP whose radio had been set upon the command channel of the Combat command. In this way the commander of each combat command at all times had accurate and prompt information of the situation in front of his advance. He often had the Air OP land and take him aloft for a rapid aerial reconnaissance to determine whether and how to deploy the command.

In the XX Corps sector, 83d Infantry Division on the north flank continued its mission of clearing the west bank of the MOSELLE. XX Corps attached one 105mm Howitzer battalion, one 155mm Howitzer battalion and one towed tank destroyer battalion to the Division to support its operations. These were retained under Division control.

Enemy artillery fire against XX Corps was relatively light throughout the sector although there was repeated shelling of our bridge across the LESSEILE at ARNAVILLE (U7547). Only light damage was inflicted upon the bridge. Artillery supporting the 5th Infantry Division massed its fires with good effect upon BILLEDNY (U7643) and LOUVIGNY (U7641) after considerable enemy activity had been observed in both towns.

The XII Corps sector was relatively quiet. A small counterattack by two reinforced companies, protected fairly deeply into the 35th Division area but was driven back and broken up by our infantry supported by massed artillery fires.

30 September. XX Corps estimated that excluding the rare days of unusually high activity, enemy artillery fired approximately 300 rounds per day into the Corps area. This was a striking testimony that the enemy had adopted a stringent policy of ammunition rationing, either because of shortages or to conserve for future operations.

The bridge at ARNAVILLE (U7547) was again shelled heavily.

XII Corps encountered light enemy artillery fires. The Corps was employing the 155mm Assault Gun platoon of a tank battalion in the role of supporting artillery.

XV Corps had fitted eight captured 88mm Guns with American sights and was using them with captured ammunition to supplement our fires.

Throughout the period, The swift advances of the initial period were slowed down and finally brought to a halt by the shortage of gasoline. Gasoline to resume the advance soon became available and the movement was resumed only to encounter an enemy who had fully exploited his brief breathing space to dig in on favorable terrain strongly supported by man-made fortifications. The operation thus changed character and became an assault of a highly organized defensive position.

Our artillery was to mold to have come into its own. Extensive preparations were fired in support of our many full scale and limited attacks. Closely coordinated counterbattery plans were prepared and executed to build up an ascendancy over the enemy's artillery. The enemy's use of the many forts, both old and modernized, presented a most difficult artillery problem. Even our heaviest artillery proved incapable of destroying these fortifications, but excellent neutralizing effect could be and was achieved. In addition there were countless harassing and interdiction missions fired.

Especially effective on appropriate targets were our time-on-target concentrations in which the fires of anywhere from two to ten or more battalions arrived simultaneously upon a single target. The 155mm Gun (SP) proved itself especially well adapted for direct fire use against fortifications and the 240mm Howitzer proved to be an extraordinarily effective weapon even as a close support weapon.

The fullest exploitation of our artillery was unquestionably seriously hampered by the prolonged scarcity of ammunition. However, close and constant supervision of expenditures by all commanders insured that the maximum benefit was realized in relation to ammunition expended.

The enemy's artillery was capably employed and when employed within the forts, as so much of it was, proved very difficult to destroy though it could be and was completely neutralized. The enemy artillery displayed considerable skill upon short bursts from forts, guns, but effective and the massing fire was also made of massed fires of battalion and larger scale. Several enemy counterattacks were supported by violent artillery preparations. Favored targets for the enemy artillery were our leading elements, observation facilities and, above all, our bridges over the MOSELLE and MEURTHE RIVERS. A surprisingly high proportion of duds was consistently noted in the enemy's fires.

CHAPTER 5
OCTOBER OPERATIONS

1 October. The 6th Armored Division attacked to the northeast toward CHAMBREY (Q0621) and LEMONCOURT (Q0130). Each combat command included one battalion of the organic divisional artillery. In addition, Combat Command A was reinforced by one 105mm Howitzer and one 155mm Howitzer battalion and Combat Command B by one 105mm Howitzer battalion. The 35th Infantry Division Artillery was prepared to fire in support on call. An extensive counterbattery schedule of eighty-nine missions was fired in support of the attack. Only light enemy artillery resistance was encountered.

XII Corps attached the 286th Field Artillery Observation Battalion to the 33d Field Artillery Brigade.

Ammunition expenditures for the seven-day period ending at 010600 October were as follows:-

	XII Corps	XV Corps*	XX Corps
105mm Howitzer	49387	24276	33488
4.5-inch Gun	2121	1806	2693
155mm Howitzer	7742	4365	12504
155mm Gun	2628	3936	2213
155mm Gun (SP)	-	-	3061
8-inch Howitzer	691	673	1515
8-inch Gun	-	-	-
240mm Howitzer	202	226	836

*Period ends on 29 September.

2 October. Enemy artillery was moderately active against XII Corps the heaviest concentration being one hundred rounds in the vicinity of the ARNAVILLE (U7547) bridge. German 155mm Howitzers emplaced in FORT DRIANT (U7753) attacked an Air OP landing strip, adjusting in turn upon and destroying four aircraft and damaging three vehicles.

Artillery with XII Corps was organized as follows:-

Attached to 83d Infantry Division - one 105mm Howitzer battalion and one 155mm Howitzer battalion.

Attached to 90th Infantry Division - one 105mm Howitzer battalion.
General support, reinforcing fires of 90th Infantry Division Artillery - one field artillery group of two 155mm Howitzer battalions.

Attached to 5th Infantry Division - one 105mm Howitzer battalion.
General support, reinforcing fires of 5th Infantry Division Artillery - one field artillery group of one 8-inch howitzer battalion and two 240mm Howitzer battalions (less one battery), one field artillery group of two 105mm Howitzer (self-propelled) battalions and one 155mm Gun (self-propelled) battalion, one field artillery group of one 4.5-inch Gun battalion and two 155mm Howitzer battalions, all operating under 33d Field Artillery Brigade which acted as a second corps artillery fire direction center in the southern part of the Corps sector. 286th Field Artillery Observation Battalion and Battery B, 7th Field Artillery Observation Battalion supported the 33d Field Artillery Brigade. The former was not sufficiently equipped to make and operate full flash and sound ranging installations.

General support - Headquarters and Headquarters Battery, XX Corps Artillery, 7th Field Artillery Observation Battalion (less one battery), and one field artillery group composed of one 155mm Gun battalion, one 8-inch Howitzer battalion, one 240mm Howitzer battery and two batteries, 90mm antiaircraft artillery guns.

In the XII Corps sector 6th Armored Division's attack encountered strong resistance south of LEMONCOURT (Q0830) but this was overcome and all objectives secured. The artillery strongly supported the attack, firing on enemy infantry and armor and including eight time-on-target concentrations.

3 October. XX Corps launched its attack upon FORT DRIANT (U7753). One infantry battalion of the 5th Infantry Division made the attack following a thirty-minute preparation fired by all artillery firing in support of both 5th and 90th Infantry Divisions, a total of twenty-three battalions. The preparation and subsequent supporting fires were directed against both DRIANT (U7753) and the neighboring fortresses of JEANNE D'ARC (U7858) and the VERDUN GROUPE (U7950) which were capable of direct fire upon our attacking forces.

An Air OP adjustment upon one of the DRIANT (U7753) gun turrets illustrated the difficulty of reducing the METZ (U85) forts. Eight direct hits were obtained upon the turret with an 8-inch Howitzer. Within fifteen minutes after the cessation of this firing, the enemy gun resumed firing.

XII Corps encountered considerable small-scale enemy resistance. 80th Infantry Division attacked to occupy the ground upon which to establish an outpost line of resistance. 35th Infantry Division, which had passed through 6th Armored Division to establish a main line of resistance in that sector, experienced sharp local counterattacks in the vicinity of LEMONCOURT (Q0130). The enemy artillery was correspondingly active.

6th Armored Division was withdrawn into an assembly area in the rear but its artillery remained in position with a mission of reinforcing the fires of the 35th Infantry Division Artillery.

4 October. XX Corps' attack on FORT DRIANT (U7753) continued to be supported with all artillery firing in support of both 5th and 90th Infantry Divisions. Enemy artillery was active, the guns of FORT DE MARIVAL (U7755) and BATTERIE MOSELLE (U7753) firing upon our troops at FORT DRIANT and the north turret of FORT DRIANT continuing its fire into GRAVELOTTE (U7558).

83d Infantry Division, continuing on the north flank with its mission of securing the high ground west of the MOSELLE, received considerable enemy counterbattery fire.

The enemy launched a strong counterattack against XII Corps at SIVRY (U8726), preceding which an artillery preparation of over 300 rounds was fired into the town.

A 280mm railway gun made its appearance upon the Army front for the first time, firing into the artillery position areas in the 35th Infantry Division sector on the night of 4 - 5 October.

5 October. One 8-inch Gun battalion newly arrived in the Army area was attached to XX Corps. Battery B, 286th Field Artillery Observation Battalion was relieved from attachment to XX Corps and attached to XII Corps.

Artillery with XX Corps fired heavily upon FORTS DE MARIVAL (U7755) and JEANNE D'ARC (U7858) to neutralize the fire which these forts had been directing upon our troops attacking at FORT DRIANT (U7753). An enemy counterattack forming in the valley between FORTS DRIANT and DE MARIVAL was broken up by our artillery fire.

XII Corps estimated that it was opposed by approximately ten battalions of light and medium artillery. Enemy artillery continued to be fairly active, especially in the vicinity of ARRACOURT (Q1114) and the 80th Infantry Division again encountered strong resistance in the vicinity of SIVRY (U8726).

Both our own and enemy artillery were employing a so-called "sniper" technique whereby a single piece was turned over to a forward observer with which he could probe suspected enemy positions close to our lines. This procedure had the advantage of being in the nature of harassing fire both observed and close in, of minimizing ammunition expenditures and, often, of flushing out a lucrative target.

6 October. Both corps experienced a short increase in enemy artillery activity. Some 400 to 500 rounds fell among our troops at FORT DRIANT (U7753) and a like amount was fired into the vicinity of ARRACOURT (Q1114). Heavy harassing and interdiction fires were encountered along the entire front.

XX Corps artillery continued to fire heavily into FORTS DE MARIVAL (U7755) and JEANNE D'ARC (U7858) in support of the attack upon FORT DRIANT (U7753) and attacked LOUVIGNY (U8641) after considerable activity was observed in the town.

XII Corps artillery was engaged in planning for its support of the projected attack to seize a more favorable defensive line. A very heavy counterbattery program was incorporated into the planned artillery preparation. To insure the effectiveness of this program, a silent policy was inaugurated whereby current counterbattery fires were confined to active enemy locations.

XII Corps artillery organization was as follows:- one field artillery group of four battalions, general support and reinforce 80th Infantry Division Artillery; one field artillery group of four battalions, general support in northern portion of Corps front; one field artillery group of four battalions, general support and reinforce 35th Infantry and 6th Armored Division Artillery with two battalions each; groupment of two field artillery battalions, general support in southern portion of Corps sector; one field artillery group of three battalions, general support and reinforce 4th Armored Division Artillery. In addition, one field artillery group operated as a second Corps Artillery fire direction [illegible]

[illegible] inaugurated an inspection program whereby all [illegible] were to be inspected by both Corps Artillery and group representatives. Representatives of the Army Artillery Section participated in a similar program and inspected every corps artillery battalion. In each case a written report was submitted to the Corps Artillery Commander.

7 October. Three field artillery battalions fired a preparation in support of a successful attack by one infantry battalion of the 83d Infantry Division on the towns of OBERHARMELANGE (L0513) and NIEDERHARMELANGE (L0513).

90th Infantry Division launched an attack on MALSTATT-LES-METZ (U8569) supported by the organic artillery of the Division reinforced by two field artillery groups consisting of five artillery battalions.

XII Corps noted a sharp decrease in the activity of enemy artillery. Artillery opposed to the Corps was for the most part centralized in four general areas, south and east of CHATEAU SALINS (U6925), between BORNEY (U8933) and LEZEY-COURT (U9431), in the vicinity of AULNOIS-SUR-SEILLE (U5630) and at COLINCOURT (Q1711). In general it was employed well to the rear and fired at near maximum ranges upon our forward elements.

Air OPs proved very effective in adjusting mortar fire and excellent results were achieved on close in targets. One artillery group installed an infantry-type radio in a liaison plane to permit direct communication between the pilot and the mortar position. Air OPs also proved effective in locating enemy mortar positions.

8 October. In the XX Corps sector our forces in FORT DRIANT (U7753) launched an attack strongly supported by an artillery preparation. Aerial bombardment followed by an artillery preparation was coordinated in support of 83d Infantry Division's successful attack to clear BUSTERBACH (L0535).

XII Corps launched a coordinated attack employing the 6th Armored, 35th and 80th Infantry Divisions to clear the enemy from the south and west sides of the SEILLE RIVER in the northern part of the Corps sector. An intensive artillery preparation was fired consisting of eighty-nine battalion concentrations upon thirty-three enemy artillery locations from H minus forty-five to H hour, followed by 12½ battalion concentrations on forty-nine enemy artillery locations from H hour to H plus ninety-five. Supporting fires included two eleven-battalion and one ten-battalion time-on-target concentration upon JEANDELINCOURT (U9028). The strong effect of our counterbattery program is demonstrated in the fact that enemy artillery reaction to our attack was light initially and continued so.

Ammunition expenditures for the week ending at 080600 October reflect the generally strong resistance encountered by both corps as well as XX Corps' attack upon FORT DRIANT (U7753). Expenditures were as follows:-

	XII Corps	XX Corps
105mm Howitzer	35951	56062
4.5-inch Gun	2241	3865
155mm Howitzer	6031	10717
155mm Gun	3584	1168
155mm Gun (SP)	-	1691
8-inch Howitzer	1311	1060
8-inch Gun	-	153
240mm Howitzer	185	568

9 October. Enemy artillery continued to be very active in the XX Corps [illegible] 400 round concentrations fell in GRAVELOTTE (U7558) and MALSTATT (U8569) respectively and the guns of [illegible] FORT JEANNE D'ARC (U7858) and the VERDUN [illegible] into our forces attacking FORT DRIANT (U7753).

XII Corps' attack encountered only light resistance except at JEANDELINCOURT (U9028) where there was very heavy fighting. Enemy artillery support of his forces was very light.

10 October. There were indications that enemy artillery, in an effort to escape our counterbattery fire, was employing a "Forhelser", a device to eliminate muzzle flash and to disrupt sound ranging by causing the sound to appear to be at a falsely close range.

Enemy guns of the BATTERIE MOSELLE (U7753) were proving difficult

DECLASSIFIED
DECLASSIFIED

Digitized by Google

to destroy. Direct hits by a 155mm Gun (self-propelled) merely bounced off the concrete emplacements and in some cases the enemy guns continued to fire even during the course of our shelling.

XII Corps' attack continued and gained all objectives although 95th Infantry Division encountered moderate resistance at POSSESSE (09689). Enemy artillery was moderately active, one 100-round concentration being received and time fire being directed at the 6th Armored Division. This was one of the few instances of the enemy employing time fire for any purpose other than registration.

11 October. XX Corps experienced a very sharp increase in enemy artillery activity with very heavy concentrations falling in the vicinity of MARIENLLES (08045) and ARNAVILLE (07547) and, somewhat smaller but still heavy concentrations upon our forces at FORT DRIANT (07755) and MALIZIERES-LES-METZ (08569).

Prisoner of War interrogation disclosed that our artillery fire had knocked out a total of six casemated guns at FORT DRIANT (07755). However, all damage had been repaired and smashed parts replaced so that all six guns were again operative.

XII Corps experienced counterattacks at FRESNES EN SAULNOIS (02457) but repulsed them and commenced its hold upon the town. 6th Armored Division was withdrawn into tactical bivouac but the Division Artillery was retained in position firing in support of 95th Infantry Division. Enemy artillery activity was heavy, the largest concentration being some 800 rounds, mostly 150mm, in the vicinity of ARRAGONEY (0111A).

One battery of an 8-inch Gun battalion was detached from XX Corps and attached to XII Corps to assist in the effort to destroy an enemy 280mm railway gun or guns, a weapon that was frequently reappearing throughout the Army area.

12 October. Orders were received from Twelfth U.S. Army Group severely restricting the ration of all field artillery ammunition through 7 November. The reduction was so sharp that both corps were found already to have expended virtually all ammunition of all calibers for the entire period.

83d Infantry Division was relieved from attachment to Third U.S. Army. Two XX Corps artillery battalions previously attached to the Division reverted to XX Corps and were attached to 90th Infantry Division to fire in support of Task Force Polk on what now became the north flank of the Army.

Prisoners of War continued to attest the effectiveness of our artillery fire.

13 October. XX Corps employed a 155mm Gun (self-propelled) to fire by axial precision methods upon the cast turret of BATTERIE HOHELLE (07755) at a range of 1250 yards. High explosive shell with T105 fuse was employed initially to blast away the concrete at the base of the turret, this being followed by shell, armor piercing. One clean penetration was obtained and the turret was effectively put out of action.

XX Corps estimated that it was opposed by a total of six battalions of enemy field artillery and, in addition, employed in the various forts around METZ (085), fifteen 100mm guns, forty 105mm guns, and eighteen 150mm guns. Enemy shelling of the rear areas of our bridgehead became especially severe.

6th Armored Division was withdrawn into tactical bivouac, being replaced in the line by the newly arrived 26th Infantry Division. As the artillery of the 26th Infantry Division had not yet arrived, 4th Armored Division Artillery was attached to and fired in support of the Division.

14 October. Both XII and XX Corps experienced considerable activity upon the part of the enemy's artillery. In the XII Corps sector the enemy's possession of the COTE DE DELME (09955) afforded him commanding observation with the result that our artillery, in order to render close support, was obliged to sacrifice defilade. Enemy counterbattery fire increased accordingly.

Our own artillery fire began to decline sharply as the orders to restrict ammunition expenditures reached the firing battalions.

15 October. Artillery commanders of all echelons strained every resource to conserve ammunition and at the same time attack and destroy otherwise lucrative targets.

XX Corps Artillery issued a directive limiting the use of field artillery ammunition to fire on such counterattacks as endangered the battle position of the supported unit, to counterbattery on active enemy batteries and to observed fires on especially profitable targets. Plans were made to employ tank destroyers, tanks and heavy antiaircraft artillery, the ammunition for none of which was released, as artillery together with captured weapons and ammunition. Interdiction, harassing and searching fires were to be confined to these secondary weapons.

Efforts to conserve ammunition manifested themselves in several ways. For example, artillery with XX Corps which on 12 October had fired ninety counterbattery missions of four or more rounds each, on 15 October fired only six such missions.

Whether because of the decline in our counterbattery fire or because of other reasons, enemy artillery firing increased both in length and number of rounds per concentration. The enemy interdicted the road running west from GORZE (07352) to CHAMBLEY (08651) with observed fires so that it became unsafe for vehicular traffic during daylight hours.

XII Corps' limited attack which began on 8 October was clearly reflected in the ammunition expenditures for the seven-day period ending at 150600 October, as follows:-

	XII Corps	XX Corps
105mm Howitzer	43551	26618
4.5-inch Gun	4040	1595
155mm Howitzer	7506	5861
155mm Gun	3981	517
155mm Gun (SP)	-	916
8-inch Howitzer	1442	740
8-inch Gun	29*	153**
240mm Howitzer	301	586

*One battery
**One battalion less one battery

16 October. Our artillery was occupied in surveying in tank destroyers, tanks--including those of the forward observers in armored field artillery battalions--and infantry and chemical mortars for use as artillery. Firing was confined to that of a retaliatory nature.

The full impact of the ammunition restriction was now apparent in both corps. All artillery with the Army fired a total of 794 rounds of field artillery ammunition of all calibers, whereas on 10 October 19,892 rounds had been fired.

17 October. Enemy patrols operating at night increased and on numerous occasions filtered through to artillery position areas. An increase in the enemy's counterbattery fire was noted and was attributed to the activities of these patrols.

18 October. The enemy continued effectively to interdict the GORZE (07352) - CHAMBLEY (08651) road.

Air OP Bulletin Number 3 was published; copy is attached, Annex 13.

19 October. Our field artillery confined its fire to registration. Effective results were obtained with the secondary weapons being employed as artillery.

Twenty rounds from an enemy 280mm railway gun fell in the vicinity of XX Corps' command post at JARNY (06565). This gun or guns appeared at intervals along the entire Army front throughout the month. Favored targets, in addition to JARNY, included HARCY (081) and FORT-A-MOUSSON (073), each of which was shelled three or more times. The effect of the fire was entirely harassing, only very minor material damage being inflicted.

The weapon was skillfully employed, firing almost exclusively within the hours of darkness from positions deep within the enemy lines. No one firing position seemed to have been used more than once and immediately upon the termination of each firing, the gun was removed to a hiding place, apparently one of the several tunnels on the extensive railroad net emanating from METZ (085). There was reason to believe that the fire was adjusted by high burst methods, precisely comparable to our own, employing three observation posts. The weapon, even for so long range a gun, was not overly accurate, having an excellent deflection pattern but excessive range dispersion.

Intense and continued efforts were made to locate and destroy this gun or guns by the artillery of both corps and by the Signal, Engineer and Artillery Sections of this headquarters as well. The extreme ranges at which the weapon was employed made location by ordinary sound and flash methods difficult and, on most occasions, impossible. Numerous suspected locations were nevertheless obtained from a variety of sources including intelligence agents, signal personnel and analysis of aerial photographs. Long-range artillery was employed for forward and high-performance aircraft were extensively utilized to adjust its fires upon these locations, including the tunnels and key points in the railroad net.

20 October. Activity along the entire Army front was limited to patrolling on both sides and both our own and the enemy artillery were relatively quiescent.

95th Infantry Division, newly arrived, began to relieve 5th Infantry Division in the line and two battalions, 95th Infantry Division Artillery, replaced two battalions, 5th Infantry Division Artillery, occupying positions previously prepared but not occupied. 5th Infantry Division Artillery retained control pending completion of the relief.

An Office of Strategic Service agent reported that a large railway gun was in the railroad shops at METZ (085) for repairs. The assistance of 0-3 Air, XX Corps and of the 10th Photo Reconnaissance Group was enlisted and an Arty/R mission was flown that same afternoon. The pilot adjusted a 155mm Gun battalion upon the shops, following which 140 rounds were fired for effect, sixty of these under air surveillance. The firing was concluded with six rounds of white phosphorus shell which caused large fires to break out. An agent dispatched to ascertain the results of the firing reported demolition of the gun, twenty-two enemy casualties, and complete wreckage of the area.

22 October. Relief of the 5th Infantry Division Artillery by 95th Infantry Division Artillery was completed and the latter assumed control. Organic artillery units of 5th Infantry Division reverted to a rest and training area in the rear. Organization of artillery with XX Corps remained the same except that Corps artillery battalions previously supporting 5th Infantry Division now supported the 95th Infantry Division.

Expenditures of artillery ammunition for the week ending at 220600 October declined, in consequence of the strict rationing, to little more than one twentieth of what they had been in the preceding week. The figures are as follows:-

	XII Corps	XX Corps
105mm Howitzer	2825	576
4.5-inch Gun	172	0
155mm Howitzer	512	41
155mm Gun	178	472
155mm Gun (SP)	-	315
8-inch Howitzer	212	179
8-inch Gun	24*	42**
240mm Howitzer	27	8

*One battery
**One battalion less one battery

23 October. Enemy artillery activity in the XX Corps sector was the lightest of any time within the past month. Because of poor observing conditions, our own fires were largely confined to night harassing missions fired entirely by secondary weapons firing as artillery. Only eight rounds of field artillery ammunition were fired by all artillery with the Corps. XX Corps artillery had a highly integrated observation system functioning, there being no less than seventy ground observation posts and sixty-two Air OPs operative.

24 October. XX Corps continued to experience only very light enemy artillery fire, there being one twelve-hour period during which not a single enemy shell landed throughout the Corps area. There was no indication of any withdrawal of enemy artillery, however, and it seemed probable that for one reason or another a silent policy was being pursued.

XX Corps artillery fired a time-on-target mission upon an enemy troop concentration at AMANVILLIERS (07664) which, from the variety of weapons used, reflected the strenuous attempts of artillery commanders to deliver effective fires despite the strict limitation of ammunition expenditures. This mission was fired by tank destroyers, tanks, German 105mm gun-howitzers, Russian 76.2mm guns, 88mm guns, captured 155mm Schneider howitzers, 90mm antiaircraft guns and 155mm guns (M1).

25 October. Enemy artillery in the XX Corps sector again became active, with very heavy fires being directed at MALIZIERES-LES-METZ (08569) and the bridgehead area south of METZ (085).

XX Corps artillery successfully used 155mm howitzer Schneider ammunition, both captured and of American manufacture, in the 155mm howitzer (M1). This was accomplished through application of a correction factor to the firing tables for the 155mm howitzer (M1).

One field artillery group was detached from XII Corps and attached to XX Corps which then detached two battalions previously attached to 90th Infantry Division and attached them to this group with a mission of general support, reinforcing the fires of the 90th Infantry Division Artillery.

Digitized by Google

DECLASSIFIED

One armored field artillery battalion and one 8Lcm Howitzer battalion, both previously in a rest area to perform necessary maintenance of equipment, were attached to XII Corps.

27 October. The guns of the VERDUN GROUPE (V7950) of forts fired very actively into the bridgehead area until XX Corps Artillery fired a time-on-target concentration upon the forts. The enemy guns thereafter remained quiet.

XX Corps' efforts to determine the amount of enemy artillery still opposed to it were seriously handicapped by the fact that because of adverse weather conditions, aerial photographs of 8 October were the most recent available.

28 October. The guns of the METZ (085) forts were very active, the fire from the VERDUN GROUPE (V7950) being especially severe and that of FORTS BRIANT (V7753) and JEANNE D'ARC (V7058) moderately so.

One tank battalion being employed as artillery by XX Corps fires a total of fifty missions and 859 rounds during the period.

In the XII Corps center three platoons of a tank destroyer battalion, newly equipped with M36 90mm tank destroyers, were employed for one in an artillery role.

29 October. 90th Infantry Division launched a coordinated attack upon MAIZIERES-LES-METZ (U8569) preceded by a thirty-minute artillery preparation fired by the organic Divisional Artillery and seven battalions of supporting XX Corps artillery, the emphasis being placed on counterbattery fires. Enemy artillery reacted strongly to the attack and included some fire coming from guns which had previously remained silent in anticipation of an attack. These were promptly counterbatteried. Air OPs maintained a constant patrol to seek out targets of opportunity and a high-performance aircraft achieved good results on a mission to seek out active enemy batteries in the vicinity of MAIZIERES-LES-METZ.

Artillery ammunition expenditures for the week ending 290600 October indicated the extent to which our artillery, notably that with XX Corps, resorted to captured guns and ammunition to render effective support. Eighty per cent of all artillery ammunition fired by XX Corps had been captured from the enemy. The figures are as follows:-

	XII Corps	XX Corps
105mm Howitzer	7086	344
4.5-inch Gun	58	0
155mm Howitzer	989	79
155mm Gun	352	190
155mm Gun (SP)	-	821
8-inch Howitzer	185	331
8-inch Gun	26*	8**
240mm Howitzer	11	194
76.2mm Gun	***	4069
88mm Gun	***	1013
105mm Gun-Howitzer	***	1489
150mm Gun	***	707
152mm Howitzer (Schneider)	***	3096

*One battery
**One battalion less one battery
***Figures not available

30 October. The attack upon MAIZIERES-LES-METZ (U8569) continued with only a small portion of the town remaining in enemy hands. Enemy artillery fire following our initial corps artillery preparation declined sharply and thereafter continued desultory. In one instance a 24cm Howitzer fired upon and destroyed a house, causing its occupants, an enemy infantry platoon, to surrender. The house was but 100 yards in advance of our lines.

Enemy artillery activity increased in the XII Corps center with particular emphasis upon our observation posts. One flash observation post was shelled intermittently over a three-hour period with a total of 150 rounds.

Headquarters and Headquarters Battery, 206th Field Artillery Observation Battalion was detached from XX Corps and attached to XII Corps. The two latter batteries remained attached one to each corps.

31 October. Headquarters and Headquarters Battery, III Corps Artillery was attached to XX Corps pending the commital of III Corps. It replaced Headquarters and Headquarters Battery, 334 Field Artillery Brigade as a second Corps Artillery fire direction center in the eastern half of the Corps center.

Headquarters and Headquarters Battery, 334 Field Artillery Brigade was relieved from attachment to XX Corps and attached to XII Corps where it replaced Headquarters and Headquarters Battery, 1894 Field Artillery Group in the role of a second Corps Artillery fire direction center.

XX Corps relieved one field artillery group of two 105mm Howitzer (self-propelled) battalions and one 155mm Gun (self-propelled) battalion from the line, moving them to a rest and training area in the rear.

Throughout the period. The first half of the period was marked by XX Corps' attack upon FORT BRIANT (V7753) and XII Corps' limited objective attack to secure a more favorable defensive position, both strongly supported by artillery. Even our heaviest artillery proved relatively ineffectual against the forts in the vicinity of METZ (085), temporary neutralization of their guns being the most that could be achieved.

The last half of the period was one of quiescence to permit the massing of supplies in rear of the Army. With the exception of the limited objective attack on MAIZIERES-LES-METZ (U8569), activity was confined to patrol actions. From an artillery standpoint, the stringent rationing of ammunition was outstanding. Resort was had to secondary weapons, including tanks, tank destroyers, antiaircraft guns and captured weapons, in order to render effective support.

CHAPTER 6
NOVEMBER OPERATIONS

1 November. Extensive re-shuffling of divisions and their supporting artillery was in progress in XX Corps. 90th Infantry Division was withdrawn into a rest and training area, most of its part of the line being taken over by 95th Infantry Division which moved north. 5th Infantry Division returned from the rest area and was re-committed in its center on the south flank of the Corps, relieving 95th Infantry Division. 10th Armored Division was committed for the first time, being assigned the left flank of the Corps from GRAVELOTTE (V7576) north. In each case the organic divisional artillery accompanied and supported its parent division. Corps artillery organization, positions and missions remained unchanged geographically, the relieving division being substituted for the relieved division and the support continued as before.

Both XII Corps and XX Corps artillery units were already far advanced in their preparations to support the coordinated attacks to be launched soon after expiration of the stringent ammunition restrictions on 7 November. Organization for combat was studied and revised in the light of the attack plans and extensive fire support plans were being prepared. All artillery was to be displaced to support the attacks more effectively and organization, preparation and even occupation of the new positions were already under way. A silent policy was imposed in the new positions and every effort was made to simulate normal activity in the old positions. Two guns per battalion were generally left behind to continue firing and flash simulators and explosive charges were extensively employed in the old position areas.

2 November. XX Corps, in its effort to minimize the effect of the stringent ammunition restrictions, was employing thirty-nine captured artillery pieces as follows:-

4 - 76.2mm Guns (Russian)
10 - 88mm Guns (German)
8 - 100mm Fortress Guns
6 - 105mm Gun-Howitzers (German)
2 - 122mm Guns (Russian)
6 - 150mm Howitzers (German)
3 - 155mm Howitzers (French)

To date the Corps had fired 30,980 rounds of captured ammunition weighing 660 tons and valued at $70Z,391.

80th Infantry Division, in the XII Corps center, launched a successful limited objective attack to seize AMANVOIRY (V9134) and LETRICOURT (V9431). The attack was preceded by a fifteen-minute artillery preparation fired by 80th Infantry Division Artillery, 6th Armored Division Artillery and three light, three medium and one heavy Corps artillery battalion. Enemy artillery reaction to the attack was strong with particularly heavy fire falling in both towns following their capture.

3 November. Enemy artillery activity was light over the entire Army front on this and the two succeeding days. Only the guns of the METZ fortresses, notably those of the VERDUN GROUPE (V7950) and of FORT BRIANT (V7753), were consistently active. Their favored targets continued to be the front-line towns of GRAVELOTTE (V7556) and MAIZIERES-LES-METZ (U8569) and the bridge sites of NOVEANT (V7668) and AMANVILLE (V7547).

DECLASSIFIED

5 November. Ammunition expenditures continued to reflect the stringent rationing, the figures for the week ending at 0600 being as follows:-

	XII Corps	XX Corps
105mm Howitzer	4343	1948
4.5-inch Gun	124	0
155mm Howitzer	1156	347
155mm Gun	501	409
155mm Gun (SP)	-	174
8-inch Howitzer	54	144
8-inch Gun	9	42
240mm Howitzer	34	98

6 November. Enemy artillery activity increased throughout the Army area, particularly in the northern sector of the XX Corps zone and at PONT-A-MOUSSON (073). Light artillery shelled the latter continuously for two hours, the rounds landing in pairs all over town.

7 November. Enemy artillery continued to be moderately active. Some 300 rounds fell in the vicinity of ALIMONTY (V9895) within a 45-minute period.

Virtually all the artillery with both corps had completed displacing to new positions for support of the forthcoming attacks. In XX Corps this involved a substantial displacement of artillery to the north flank in the vicinity of BOIS D'ORTANGE (V7595) to support 90th Infantry Division's projected crossing of the MOSELLE RIVER in the vicinity of KONINGSMACKER (U9469). In all cases where pieces had been left behind to continue firing from the old positions, plans had been completed for their displacement on the nights immediately preceding the attacks.

8 November. XII Corps launched a coordinated attack at 0600 upon the entire Corps front employing three infantry and two armored divisions. An intensive program of preparation and supporting scheduled fires, prepared by XII Corps Artillery and the supporting 334 Field Artillery Brigade, was fired from H minus 60 to H plus 147. The program was fired initially by all artillery with the Corps supplemented by one medium and four heavy battalions of XX Corps artillery on the latter's south flank. After the first half hour all organic divisional artillery was released for "on call" missions and targets of opportunity in close support of the respective divisions.

The program embraced a total of 380 concentrations fired by an average of two battalions per concentration, the heaviest being a six-battalion, two-volley concentration upon the town of GRINGOMERT (U0330) In all, ninety concentrations were fired upon towns, thirteen on defiles, 190 on enemy artillery locations, forty on enemy OPs, thirty-one on enemy antiaircraft artillery locations, fourteen on assembly areas and one each on a strongpoint and on a farm building.

Upon completion of the prearranged program Corps artillery continued to maintain intense neutralization fires until 1200 hours, firing on targets selected from the schedule of prearranged fires. Thereafter heavy fires were delivered upon call of the supported units.

This intensive artillery support achieved excellent results. It effectively prevented any aggressive enemy artillery reaction to our attack. Only fifteen reports of enemy shelling were received over the entire Corps front and of these all were small concentrations of less than twenty rounds each. In addition, utter and complete disruption of the enemy's communications was occasioned by our artillery fires, a fact amply attested by many Prisoners of War.

Artillery with XII Corps was organized for support of the attack as follows:-

General support, reinforcing 26th Infantry Division - 334 Field Artillery Brigade composed of one field artillery group, one light, two medium and one heavy artillery battalion.
General support, reinforcing 80th Infantry Division - organic artillery of the 6th Armored Division and two field artillery groups of three light, three medium and one heavy battalion.
General support, reinforcing 35th Infantry Division - organic artillery [illegible] Division and two field artillery groups of two light, [illegible] battalion.
[illegible] heavy artillery battalions.

[illegible] 95th Infantry Division to launch a "feint" attack across the MOSELLE in the vicinity of UCKANGE (U8579). The attack started at 1500 hours and was supported by both the organic 95th Division Artillery and the fortress guns of FORT GUENTRANGE (U8307) manned by a Corps artillery battalion.

9 November. 90th Infantry Division attached at 0330 hours to secure a bridgehead across the MOSELLE at KONINGSMACKER (U9469) on the

Digitized by Google

south flank of XX Corps. Surprise being considered essential to the night attack, no artillery preparation was fired. A comprehensive program of counterbattery and prearranged fires had been prepared however and was fired by all artillery supporting 90th Infantry Division commencing at H hour and continuing until H plus 120. Strong support was maintained thereafter on enemy artillery locations and upon "on call" missions from the Division.

90th Infantry Division continued to press its bridgehead at UCKANGE (0579) and came after daylight 9th Infantry Division, on the south flank of XX Corps, attached to the east.

Enemy artillery opposition to the XX Corps attacks, and especially to that of 90th Infantry Division, was extremely light. It was clear that our artillery had achieved an overwhelming accendancy. Only the fortress guns in the vicinity of METZ (0895) fired heavily. What little other fire was received came almost entirely from self-propelled guns which were quickly attacked and either neutralized or destroyed.

Organization of artillery with XX Corps for support of the Corps attack was as follows:-

Attached to 90th Infantry Division - one light battalion.
General support, reinforcing 90th Infantry Division - one field artillery group of two medium battalions.
General support in the zone of 90th Infantry Division - organic artillery of the 10th Armored Division, one light and one medium battalion of the 85d Division Artillery together with its attached field artillery group of one medium and one heavy battalion, two field artillery groups consisting of two light and four heavy battalions, one 8-inch Gun battery, eight 100mm fortress guns and two tank destroyer battalions operating in an artillery role.
General support, reinforcing 95th Infantry Division - one field artillery group consisting of one light and one medium battalion and one battalion equipped with captured weapons.
Attached to 5th Infantry Division - one light battalion.
General support, reinforcing 5th Infantry Division - one field artillery group of three medium battalions.
General support in the zone of 5th Infantry Division - Headquarters and Headquarters Battery, III Corps Artillery and one field artillery group consisting of two heavy battalions and one 8-inch Gun battery.

Despite adverse weather conditions XII Corps' attack made good progress so that most of the artillery was already commencing to displace forward so as to continue in close support. The artillery fired heavily on targets of opportunity throughout the day and instituted a program of intensive harassing and interdiction fires. In order to deny the enemy shelter from the inclement weather, all weapons from the 105mm Howitzer to the 240mm Howitzer were utilized to fire, in addition to the usual supply and command post installations and main supply routes, upon all towns and farm buildings within the range and fire possibilities of the artillery with the Corps. A similar program, adapted to its own tactical requirements, was instituted by XX Corps. The harassing and interdiction program was fired on a 24-hour basis with the fires being intensified at night.

COTE DE DELME (9989), the dominant high ground in the northern XII Corps sector, was shelled steadily for eight hours by 4.5-inch Guns, 155mm Guns and 8-inch Howitzers culminating in an aerial bombardment. 80th Division infantry moved up immediately thereafter to occupy the ridge, finding that the enemy had been forced to evacuate under the heavy artillery and air bombardment.

10 November. Adverse weather and floods gripped the entire Army front. How bridging operations became impossible and, in the XX Corps sector, all but one of the existing bridges over the MOSELLE were destroyed by the high waters. Supply of the bridgehead troops became difficult in the extreme. Field artillery liaison-type aircraft were resorted to. They flew thirty-two missions on this date and an additional sixty-five missions on 11 November, carrying rations, blood plasma and other medical supplies, blankets, wire, radio batteries, and mortar and small arms ammunition to infantry elements of the 90th Infantry Division.

Minor changes were effected in the artillery organization for support to meet the developing tactical situation. Artillery throughout the Army area continued to displace forward though in the XX Corps area artillery movement was necessarily confined to the west bank of the MOSELLE.

The enemy artillery became more active over the entire front. The fires were directed, as usual, entirely upon our forward elements, observation facilities and the bridgehead areas. Enemy concentrations were sporadic and invariably small, the heaviest consisting of twenty-four rounds of 88mm fire into the 90th Infantry Division bridgehead over a forty-minute period.

11 November. The gun battalion of 8-inch Guns assigned to Army was widely deployed so as to employ the extreme long range of this weapon over the widest possible frontage. XX Corps, with the battalion less a battery attached, employed one firing battery in the Corps north sector and the other in the south sector. XII Corps, with one firing battery attached, employed one platoon in its north sector and the other in its south sector. Both corps used the weapon primarily for long-range harassing and interdiction fires on the enemy's extreme rear areas.

Despite the continued floods the attack made progress. CHATEAU SALINS (0595) fell to XII Corps and 90th Infantry Division maintained and expanded its KOENIGSMACHER (9589) bridgehead. 95th Infantry Division attacked to secure another bridgehead at THIONVILLE (0586) strongly supported by captured fortress guns firing upon targets of opportunity.

12 November. The enemy's artillery fires were directed west heavily against 90th Infantry Division on the Army's north flank, were heavy throughout the central areas and declined to a point where they were very light in the southern part of the XII Corps sector.

Floods continued to hamper our bridging operations, a situation upon which the enemy capitalized by strong artillery firing into our bridge sites. The pontoon bridge in the KOENIGSMACHER bridgehead at MALLING (9999) was destroyed by fire from 88mm self-propelled guns. These guns were moved forward under cover of darkness into positions so close to our lines that although the flashes of their firing were perfectly visible, our artillery could not successfully take them under fire. These guns fired throughout the night and finally destroyed the bridge.

90th Infantry Division continued able only to maintain its bridgehead and unable to advance substantially. The infantry was strongly counterattacked by enemy tanks and infantry in the vicinity of KERLING (9989). Tank destroyer support was lacking due to the continued flood conditions. The counterattack was supported by heavy artillery fires initially but these were quickly silenced by the intensive counterbattery fires of XX Corps artillery. All artillery supporting the 90th Division, including that of 10th Armored Division, fired heavily in support of the infantry and a 155mm Gun battalion was especially effective in repelling the tank threat, firing over 300 rounds and in one instance destroying three tanks with only two rounds.

95th Infantry Division, supported by its organic artillery, three heavy battalions of XX Corps artillery and the captured guns of FORT GUENTRANGE (0838?), succeeded in establishing and consolidating its bridgehead at THIONVILLE (0586).

XII Corps experienced an enemy counterattack in the FORET DE CHATEAU SALINS (013) but it was only lightly supported by enemy artillery.

Arty/R pilots advised XII Corps Artillery of a large enemy troop concentration in the northeastern portion of BOIS DE CHATEAU SALINS (0105). 8-inch Guns and Howitzers and 240mm Howitzers fired into the area for twenty minutes following which the enemy armored and infantry elements fled in confusion.

Ammunition expenditures for the week ending at 120600, embracing only four days of the XII Corps attack and three days of the XX Corps attack, amply reflected the heavy fighting in both corps but were indicative only of ammunition availability. The figures follow:-

	XII Corps	XX Corps
105mm Howitzer	54891	30212
4.5-inch Gun	6941	1526
155mm Howitzer	9174	9510
155mm Gun	5110	1197
155mm Gun (AP)	-	548
8-inch Howitzer	2581	811
8-inch Gun	71	147
240mm Howitzer	404	295

13 November. Enemy artillery activity decreased generally throughout the Army area. It continued heaviest on the north flank and in the vicinity of the MOSELLE bridgeheads and dropped off to light firing on the south flank of the Army.

The flood waters had commenced to recede, making it possible to construct and place in operation three bridges across the MOSELLE. The bridgeheads at KOENIGSMACHER (9589), THIONVILLE (0586) and UCKANGE (0579) were all expanded and 10th Armored Division commenced its movement across the MOSELLE to pass through the 90th Infantry Division and debouch to the north and west. XX Corps artillery generally displaced to positions immediately west of the MOSELLE, as artillery crossing the river pending completion of the 10th Armored Division crossing.

The effect of our massed artillery fire upon the enemy is implicit in the request by a Prisoner of War that he be permitted to view our "automatic" artillery weapons. The Commanding General of METZ later voiced the same sentiment after his capture.

14 November. The enemy continued his efforts to destroy the MOSELLE bridges in the northern XX Corps sector with artillery fire. He employed both self-propelled guns firing from positions so close as to be virtually within our lines and medium weapons firing at extreme ranges from positions so far in the rear as to be out of range of both our light artillery and our sound and flash bases. The firing was done almost entirely at night by unobserved methods so that small damage was inflicted. Two hits on one bridge represented the sum total of the enemy's efforts and this damage was quickly repaired. Nevertheless the fire fell in sufficient volume to force temporary cessation of bridging operations on several occasions. The heaviest volume of fire received was 180 rounds, mostly of 150mm caliber, in the vicinity of the THIONVILLE (0586) bridge.

Eighteen rounds from a 280mm railway gun landed in the CONFLANS (0634) - JARNY (0656) vicinity where XX Corps CP was still located, thus ending a period of two weeks during which this gun had not fired into the Army area.

XX Corps artillery organization remained substantially unchanged except that 10th Armored Division Artillery was now supporting the Division and had ceased to reinforce 90th Infantry Division Artillery. All artillery operating in support of the 90th Infantry Division was in the process of displacing to positions east of the MOSELLE.

In the XII Corps sector, 35th Infantry Division and Combat Command B, 6th Armored Division launched an attack to secure MORHANGE (8?056). The attack was preceded by a thirty-minute artillery preparation fired upon towns, assembly areas and enemy artillery locations by the organic artillery of both divisions and six battalions of Corps artillery. All XII Corps artillery except that supporting the 26th Infantry Division displaced forward during the day.

Both corps continued their programs of heavy harassing and interdiction fires upon all towns within range. Numerous Prisoner of War reports attested the efficacy of these programs, saying that it was effectively denying use of the towns to the enemy and that they were ordered to evacuate the towns and utilize the wooded areas adjacent thereto. These areas were interpreted into the program accordingly.

15 November. XX Corps continued the process of expanding and joining its bridgeheads. Enemy artillery opposition showed a marked drop, of the bridges only that at MALLING (9959) being shelled and that in much smaller quantity. It seemed evident that the enemy artillery was beginning to withdraw to the east.

35th Infantry Division's attack progressed and was closing in upon MORHANGE (8?056). 26th Infantry Division launched an attack to secure the high ground at HAUBERT (8?615), the attack being preceded by a forty-minute artillery preparation. The attack got off to a bad start however and encountered heavy tank opposition initially. A 155mm Howitzer battalion succeeded in destroying six enemy tanks. An enemy infantry counterattack was broken up by light artillery fire. Thereafter the attack progressed well.

Enemy artillery opposition to XII Corps remained at the level of preceding days except for a sharp increase on the south flank. One enemy artillery concentration upon the 4th Armored Division at BOURG-ALTROFF (8?830) was the heaviest in this Division's experience to date upon the Continent.

Eighteen rounds from a 280mm railway gun landed in the vicinity of the XII Corps CP at CHATEAU SALINS (0595) only twelve hours or so after the CP had been displaced to that location.

Certain experimental sound equipment, whereby a modified SCR-610 radio was used to link the sound microphones to the recording equipment, was set up at the 14th Field Artillery Observation Battalion in accordance with instructions from the War Department.

16 November. Enemy artillery fires opposed to XX Corps continued to decline. 5th Infantry Division was continuing to advance east and north in the vicinity of METZ (0895) and the 95th Infantry Division was attacking on the west bank of the MOSELLE in the vicinity of FORTS BELLART (0775?) and JEANNE D'ARC (0795?). A very strong counterattack against 90th Infantry Division was broken up by our artillery fire which in one instance knocked out seventy per cent of one enemy infantry company even before it could establish contact.

In the XII Corps sector, 80th Infantry Division made local gains against heavy enemy resistance that was strongly supported by artillery. Three counterattacks against the Division were repulsed by the infantry

Digitized by Google

DECLASSIFIED

and the supporting artillery.

35th Infantry Division seized MANHANGE (Q2056) and the high ground to the east despite active artillery opposition that decreased considerably as darkness set in. It was quite usual in this sector for the enemy artillery fire to decline sharply at night, apparently indicating an emphasis upon observed fires.

Combat Command B, 6th Armored Division launched a limited objective attack in the wake of a thirty-minute artillery preparation fired by the organic Division Artillery and seven battalions of Corps artillery.

17 November. XII Corps' horseshoe around METZ (U85) was gradually closing east of the city with 5th Infantry Division advancing from the south and 90th and 95th Infantry Divisions from the north. Enemy artillery resistance continued to decrease in converse ratio to the increasing threat to the enemy forces in and about the city.

5th Infantry Division encountered two strong counterattacks that were repulsed by the fires of the Division Artillery and its supporting XX Corps artillery. 95th Infantry Division encountered strong organized resistance south of WOIPPY (U8462) and 10th Armored Division, on the northeast flank of the Corps, had a severe three-hour fire fight before taking EISCHMAUKEN (Q0589).

90th Infantry Division encountered strong opposition at METZLEN-WISSE (U9L8C). A concentration consisting of "Battalion fifteen volleys" 4.5-inch Gun, "Battalion ten volleys" 155mm Gun and "Battery five volleys" 8-inch Howitzer was placed upon the town following which the infantry entered unopposed.

A XX Corps Artillery fire mission served to illustrate the speed and efficiency of field artillery communications and fire direction procedure. At 1159 hours the Corps Artillery fire direction center received a request for fire to be completed at 1505 when the infantry would move out. The target was plotted, a battalion selected to fire the mission and the coordinates sent to the battalion. The latter plotted the target, prepared the necessary fire commands and transmitted them to the guns in sufficient time that sixty-seven rounds of 155mm Gun ammunition were fired before expiration of the time limitation.

XII Corps units generally were consolidating and re-grouping in preparation for resumption of the advance. Six Corps artillery battalions displaced forward.

XII Corps Artillery estimated that it was opposed by a total of fifteen battalions of enemy artillery the great bulk of which was concentrated against the north flank of the Corps.

18 November. Enemy artillery resistance to XX Corps continued to decline and became virtually desultory. The horseshoe around METZ (U85) continued to close and heavy harassing and interdiction fires were placed by all artillery with XX Corps on the escape routes out of the city.

XX Corps artillery battalions fired a fifteen-minute preparation of thirty rounds, 240mm Howitzer and 130 rounds, 155mm Howitzer in support of an attack by elements of the 95th Infantry Division upon FORT ST JULIEN (U8961) north of METZ.

Continued adverse weather conditions, including heavy rains, poor visibility and high winds, seriously hampered the efficiency of all counterbattery intelligence agencies, including sound and flash bases and both ground and Air OPs. To counteract this condition, XX Corps Artillery utilized observation battalion personnel to form additional Shellrep teams one of which was attached to each infantry regiment of the 90th Infantry Division.

Adverse weather was also seriously hampering the operation of Air OPs. In addition to six planes lost because of flood waters, one crashed when a sudden localized snow flurry reduced visibility to zero, two were torn from their moorings by high winds and were turned over and two crashed in attempting to take off because of frost formed on their wings. In addition, operations from extremely muddy fields caused mud and gravel to be thrown up on the propellers, causing damage thereto and destroying their balance. A serious shortage of propellers developed in consequence.

In the XII Corps sector 35th Infantry Division attacked to the east. All Corps artillery battalions participated in a schedule of prearranged fires from H minus thirty to H plus forty-eight during which twenty-three towns, ten CPs, twenty-nine enemy artillery locations, five farmhouses and twenty-three woods were attacked. Neutralization fires were continued thereafter on call. Enemy infantry and artillery resistance to the attack was light.

19 November. Enemy artillery activity in the XX Corps sector declined almost to the point of nothingness. All mobile artillery seemed to have been withdrawn from the METZ (U85) area to positions defending the SAAR RIVER.

The enemy made extensive use of smoke pots to cover the roads east from METZ (U85). A closely coordinated program of harassing and interdiction fires was fired upon crossroads and other critical points on the escape routes by 5th and 95th Infantry Divisions' Artillery and their supporting XX Corps artillery battalions, embracing all calibers from the 155mm Howitzer to the 240mm Howitzer. Toward the close of the period the 5th, 90th and 95th Infantry Divisions established contact east of METZ, closing the horseshoe.

Both the 80th and 35th Infantry Divisions in the XII Corps sector encountered rising enemy artillery opposition but the attack to the east continued nevertheless. 80th Infantry Division Artillery and its supporting Corps artillery battalions fired an active counterbattery program following which enemy artillery firing declined and became negligible after dark.

26th Infantry Division attacked to the east. The Division Artillery and four supporting Corps artillery battalions fired a one-hour preparation in support thereof and thereafter fired both scheduled and "on call" missions in support.

Both 4th and 6th Armored Divisions were in XII Corps reserve temporarily and the artillery thereof fired in support of 26th and 35th Infantry Divisions respectively.

In the seven-day period ending at 0600, artillery with both XII and XX Corps did its most active firing since the two corps were committed in August. Nevertheless artillery ammunition was still not available in the amounts required by the operation. Expenditures therefore reflect not so much the requirements of the week's fighting but rather the availability of ammunition. The figures follow:-

	XII Corps	XX Corps
105mm Howitzer	99295	74480
4.5-inch Gun	1753	3552
155mm Howitzer	21096	17956
155mm Gun	7088	2955
155mm Gun (SP)	-	533
8-inch Howitzer	4167	2070
8-inch Gun	92	112
240mm Howitzer	284	364

20 November. 5th Infantry Division proceeded with the task of clearing METZ (U85) and the remaining forts in the vicinity thereof. The balance of XX Corps and its artillery commenced to re-group preparatory to resumption of the attack to the east to secure crossings of the SAAR.

10th Armored Division on the northeast flank of the Corps received extremely heavy artillery fire from enemy positions east of the SAAR in the vicinity of MERZIG (Q2094).

In the XII Corps sector, 35th Infantry Division supported by Combat Command B, 6th Armored Division resumed its attack to the east following a 45-minute artillery preparation fired by the organic artillery of the two divisions and four supporting Corps artillery battalions. Light but well organized resistance was encountered so that the supporting artillery continued to fire heavily upon "on call" missions, including several six-battalion time-on-target concentrations.

26th Infantry Division made two limited objective attacks to the east preceded by a thirty-minute artillery preparation fired by the Division Artillery and four supporting Corps artillery battalions.

21 November. 80th Infantry Division attacked and secured three bridgeheads over the NIED RIVER at CREHANGE (Q1550), FAULQUEMONT (Q1750) and PONTPIERRE (Q2Q49). Enemy artillery opposition was light both in reaction to the initial attack and throughout the remainder of the XII Corps front. The continued decline in the enemy's artillery fires indicated a withdrawal of his artillery, probably to positions east of the SAAR.

A check of the current situation as to segregation of artillery ammunition by lot numbers revealed marked improvement both in ammunition arriving at the Army railhead and that arriving at the using units.

22 November. 10th Armored Division, approaching the SAAR on the northeast flank of XX Corps, encountered heavy artillery fires from positions east of the river.

Our artillery fires in the METZ (U85) area had decreased for several days as the enemy forces were increasingly constricted until on this date artillery with 5th Infantry Division did no firing and that with 95th Infantry Division only a very small amount.

A critical shortage of field wire developed throughout the Army. A directive was published to all field artillery units requiring maximum reclamation of wire upon displacement.

Air OP Bulletin Number 4, Annex 14, copy attached, was published.

27 November. All artillery with XX Corps re-grouped and commenced to move into position to support the planned attack to secure crossings of the SAAR. The new organization for combat was as follows:-

Attached to a 5th Infantry Division regimental combat team (containing METZ (U85) forts) - one organic Division battalion and one Corps battalion armed with captured guns.
General support, reinforcing 10th Armored Division - one field artillery group of two light, one medium and one heavy battalion, the last less one battery.
General support in zone of 10th Armored Division - one field artillery group of two heavy battalions and one 8-inch Gun battery.
General support, reinforcing 90th Infantry Division - one field artillery group of one light and two medium battalions.
General support, reinforcing 4th Infantry Division - 5th Infantry Division Artillery (less one light battalion) and one field artillery group of two light and one medium battalion.
General support in zone of 90th and 95th Infantry Divisions - one field artillery group of two medium battalions and one heavy battery.
General support in zone of 26th and 5th Infantry Divisions - one field artillery group of three heavy battalions and one 8-inch Gun battery.
Fire direction center in southern portion of Corps sector - Headquarters and Headquarters Battery, III Corps Artillery.

In the XII Corps sector a heavy counterattack was thrown against 35th Infantry Division. The infantry supported by strong artillery fires repulsed the threat and inflicted heavy losses.

A thirty-minute artillery preparation in support of an attack by 26th Infantry and 4th Armored Divisions was fired by the organic artillery of both divisions and four supporting Corps artillery battalions. Heavy resistance was encountered in the vicinity of ALBESTROFF (Q5537) so that strong artillery fires were continued on call.

28 November. The volume of enemy artillery fire increased throughout the Army area as the advance approached the SAAR. Medium-caliber fire coming from new areas tended to indicate also that the enemy was bringing up additional artillery for his defense of the SAAR.

The enemy launched a night counterattack at HILSPRICH (Q3946), employing 100 infantry and five tanks. Our artillery fired strong defensive fires including one thirteen-battalion time-on-target concentration on the town. Nevertheless the counterattack achieved temporary success, the enemy not being expelled from the town until the next day.

29 November. Enemy artillery was light in the XII Corps sector but continued to increase in XX Corps both as to volume of fires and number of guns firing. Artillery with XX Corps continued to displace to the east. Rain, fog and low clouds, as they had so often in the past month or more, seriously hampered all observation agencies and so compelled firing by unobserved methods almost exclusively.

30 November. XX Corps experienced intense enemy artillery fire so that for the first time since the Corps started fighting, enemy artillery fires against it exceeded its own fires. The enemy fire however declined as usual to almost nothing at night.

Ammunition expenditures for the week ending at 0600 declined appreciably in XII Corps from the preceding week's level and very markedly in XX Corps. The latter was attributable to the extensive reorganization for the advance to the east that followed the fall of METZ (U85). The figures follow:-

	XII Corps	XX Corps
105mm Howitzer	74437	37273
4.5-inch Gun	2260	169
155mm Howitzer	15061	5060
155mm Gun	3334	438
155mm Gun (SP)	-	861
8-inch Howitzer	1866	709
8-inch Gun	67	43
240mm Howitzer	300	106

27 November. There was every evidence that the enemy would make a determined stand along the SAAR, strongly supported by artillery. In his defense of METZ (U85) he had employed no weapon of larger caliber than 150mm. Along the SAAR, however, XX Corps had already identified at least one battery of 170mm guns, one 170mm railroad gun and rocket projectors of unidentified calibers.

DECLASSIFIED

Digitized by Google

80th Infantry Division in the XII Corps sector experienced four enemy counterattacks all of which were repulsed by massed artillery fires.

28 November. Enemy light and medium artillery fire was extremely light whereas heavy long-range artillery fire continued moderate to heavy, indicating that the enemy's more mobile weapons were now joining his heavy artillery in positions east of the SAAR.

5th Infantry Division Artillery was relieved of its mission of firing in support of 95th Infantry Division and reverted to 5th Infantry Division control.

29 November. Both 90th and 95th Infantry Divisions were advancing steadily to the SAAR. The organic divisional artillery and supporting XX Corps battalions rendered strong support despite frequently bad visibility, firing largely upon targets of opportunity, counterbattery missions and harassing and interdiction fires.

Throughout the period. The crushing offensive of 8 - 9 November saw Third U.S. Army return to the attack. Artillery with the Army played a major role as the Army broke out of its positions along the MOSELLE RIVER and commenced its inexorable advance upon the SAAR basin.

The initial artillery preparation in support of XII Corps' attack was perhaps the most massive in the operational history of the Army to date. Forty-two artillery battalions, embracing some 540 guns, participated in these fires.

Bad weather and sudden floods critically endangered the attacking troops initially, notably the infantry elements of the 90th Infantry Division isolated east of the MOSELLE RIVER in the KOENIGSMACHER (U4289) bridgehead. Four days elapsed before a bridge could be completed and tank destroyers moved across the river into the bridgehead. The enemy utilized this period for repeatedly heavy tank and infantry counterattacks against the bridgehead forces. The tenacious defenders, heavily supported by the powerful close-in defensive fires of twenty artillery battalions, successfully repelled every threat.

The subsidence of the floods marked the end of the critical period. By 19 November the encirclement of the fortress city of METZ (U86) was completed and its final reduction in process. Thenceforth the Army drove steadily toward the SAAR.

Despite harsh weather, poor observation and mud, artillery support of the advances was heavy and continuous, embracing scheduled and on call missions, observed and unobserved fires. Especially heavy harassing and interdiction fires were fired at all times, most notably upon the escape routes as the encircling vise closed about METZ (U86).

CHAPTER 7
DECEMBER OPERATIONS

1 December. 95th Infantry Division's attack to clear the enemy from the west bank of the SAAR RIVER in the vicinity of SAARLAUTERN (Q8079) was preceded by a ninety-minute aerial bombardment coordinated with an artillery anti-flak program. Air OP patrols were flown and all ground observers were alerted to scrutinize all known enemy antiaircraft positions, to search for such others as might become active and to attack immediately all active positions. The bombardment was followed by an intensive artillery preparation fired by all available artillery with the Corps.

XII Corps artillery continued its heavy harassing and interdiction fires, firing on no less than thirty-nine towns and siting the heavy, long-range weapons to attack SAARBRUCKEN (Q6571, SAARGUEMINES (Q6747) and FORBACH (Q5965). Enemy artillery in turn showed an increasing tendency, especially in the XX Corps zone, to attack small towns behind our lines in recognition of our use thereof for command posts and shelter.

2 December. Combat Command A, 10th Armored Division attached supported by 10th Armored Division Artillery to clear the enemy from the west bank of the SAAR RIVER in its zone in the vicinity of MERZIG (Q2094).

Artillery with XII Corps, supporting five divisions, was organized as follows:-

General support, reinforcing 80th Infantry Division with one light and one medium battalion and 4th Armored Division with one medium battalion - one field artillery group of one light, two medium and one heavy battalion.

General support, reinforcing 4th Armored Division - one field artillery group of two light and one medium battalion.

General support, reinforcing 95th Infantry Division - one field artillery group of one light and one medium battalion.

General support, reinforcing 90th Infantry Division - one field artillery group of one light, one medium and two heavy battalions.

General support, reinforcing 4th Armored Division - one field artillery group of one light and two medium battalions.

General support - three heavy battalions plus one battery, 8-inch guns.

Fire direction center in northern part of Corps zone - Headquarters and Headquarters Battery, XII Corps Artillery supported by one field artillery observation battalion with one platoon, topographic engineers attached.

Fire direction center in southern part of Corps zone - Headquarters and Headquarters Battery, 33rd Field Artillery Brigade supported by one field artillery observation battalion (less one battery).

3 December. 95th Infantry Division launched an attack to secure a crossing of the SAAR at SAARLAUTERN (Q6079). The attack was preceded by an air strike followed by an artillery preparation fired by the organic artillery of both 95th and 90th Infantry Divisions, three battalions of 5th Infantry Division Artillery and twelve battalions of XX Corps artillery. The attack succeeded, a bridgehead being secured and one of the bridges over the river being seized before it could be demolished. This attack was further supported by fires in the nature of a preparation fired by the 90th Infantry Division Artillery to simulate an attack in the vicinity of BOERINGEN (Q4480).

In the XII Corps sector, 80th Infantry and 4th Armored Divisions also attacked. The organic artillery of both divisions and seven Corps artillery battalions supported this attack with a schedule of preparation fires from H minus forty-five to H plus sixty-three. Enemy artillery positions, towns, command posts and supply points were among the targets attacked.

Ammunition expenditures for the week ending at 030600 continued heavy as Third U.S. Army approached the outer defenses of the SIEGFRIED LINE. The figures are as follows:-

	XII Corps	XX Corps
105mm Howitzer	60827	76701
4.5-inch Gun	4474	3540
155mm Howitzer	10534	21582
155mm Gun	5405	4410
155mm Gun (SP)	-	1553
8-inch Howitzer	1954	1656
8-inch Gun	178	73
240mm Howitzer	436	258

4 December. Attacks progressed along the entire Third U.S. Army front. 4th Armored Division's attack, on the south flank of XII Corps, was preceded by an artillery preparation on the towns of DONNERSKEL (Q5734), WALLERSBERG (Q4562), LORENTZEN (Q2949) and the high ground to the north, fired by 4th Armored Division Artillery and four battalions of Corps artillery. In the northern XII Corps sector the attack of 95th and 90th Infantry and 6th Armored Divisions progressed favorably against small arms and mortar fire but only light artillery opposition.

The enemy, apparently believing that XX Corps' main attack would come in the vicinity of MERZIG (Q2094), had massed its artillery in that area. The initial artillery reaction to the 95th Infantry Division bridgehead at SAARLAUTERN (Q6079) had been extremely light. Now however it became increasingly severe so that an estimated 7,500 rounds of light and medium artillery fell in the SAARLAUTERN (Q6079) bridgehead area during the period. The enemy fires were directed particularly at our bridge.

5 December. All artillery with XX Corps was displacing by echelon in close support of the advance of 90th and 95th Infantry Divisions.

Activity of enemy artillery opposed to XII Corps became negligible but that opposed to XX Corps continued to increase. The mass of enemy artillery was concentrated in the vicinity of SAARLAUTERN (Q6079) and enemy fires into the bridgehead area increased to a point of extreme severity. An estimated twenty-five battalions of enemy artillery were in the area and counterbattery measures were seriously hampered by bad weather conditions resulting in a lack of adequate current photo cover.

6 December. 4th Armored Division was relieved in the XII Corps zone by 12th Armored Division, the artillery of 4th Armored Division remaining in position to fire in support of 12th Armored Division.

95th Infantry Division, engaged in heavy street fighting in its bridgehead east of the SAAR, received very heavy artillery support. Fighting was of a house-to-house, street-to-street nature. Whenever one side of the street was cleared, heavy artillery, 8-inch howitzers and 240mm Howitzers, was adjusted by forward observers upon the buildings on the opposite side of the street until a breach was effected. The infantry then dashed into the breached building and cleared the street house-by-house, whereupon the process was repeated. Enemy artillery fires in opposition to the 95th Infantry Division's bridgehead continued violent.

90th Infantry Division launched an attack across the SAAR at FACHTEN (Q4544) at 0430. To preserve surprise, no artillery preparation was fired. However, an intensive schedule of counterbattery fires was fired from H hour to H plus forty-five consisting of approximately 8,000 rounds on thirty-nine enemy artillery locations. Enemy artillery reaction to the attack was extremely light initially but tended to increase gradually, apparently as the enemy shifted and displaced part of the artillery previously firing at SAARLAUTERN (Q6079).

7 December. Enemy artillery fire against the 90th Infantry Division bridgehead continued to increase in intensity whereas that against 95th Infantry Division declined but was still severe.

8 December. The enemy fired flares at the bridge sites in the XII Corps sector and then attacked them with observed artillery fires. The enemy artillery reaction to both the 90th and 95th Infantry Divisions' bridgeheads dropped off sharply to an average of six and fifteen rounds per hour respectively.

Several heavy counterattacks were launched against both XX Corps bridgeheads, all of which were repulsed with the aid of strong fires from the supporting divisional and Corps artillery. A tank and infantry counterattack in the vicinity of MERZIG (Q5396) was broken up by artillery with XII Corps.

Divisional artillery of 26th Infantry and 4th Armored Divisions and four battalions of XII Corps artillery fired a ninety-minute preparation in support of the attack of 26th Infantry and 12th Armored Divisions and thereafter fired heavily on call. Subsequently the artillery marked the targets for an air strike in support of the attack.

XX Corps attached one battery each of 155mm Guns (SP) to both 90th and 95th Infantry Divisions for direct fire against pillboxes and fortified houses. Enemy fire knocked out one of these guns whereupon another was brought up, emplaced behind a smoke screen and completed the mission by indirect fire methods.

87th Infantry Division was detached from XII Corps and relieved 5th Infantry Division, investing the remaining METZ (U86) forts. An artillery battalion armed with enemy material, previously attached to 5th Infantry Division, was attached to 87th Infantry Division. Artillery of 5th Infantry Division moved forward to positions on the south flank of XX Corps.

Photographic equipment and personnel sufficient to permit the taking, developing and printing of oblique photographs was delivered to XII Corps Artillery. Continued adverse weather conditions had demonstrated that Air OPs operating from airstrips close behind the lines could take advantage of brief localized breaks in the weather whereas Air Corps planes operating from fields further to the rear were forced to remain on the ground.

9 December. There were increasingly frequent small-scale counterattacks against the FACHTEN (Q4544) and SAARLAUTERN (Q6079) bridgeheads but enemy artillery activity continued to decline. There was occasional shelling of the river crossings with white phosphorus at night, apparently to light up the area to detect any bridging operations.

4th Armored Division Artillery in the XII Corps sector was withdrawn from the line and placed in reserve for necessary re-fitting and maintenance.

A demonstration was conducted in conjunction with XII Corps Artillery to acquaint artillery personnel with XII Corps with the use and characteristics of the new Posit fuze. One 105mm Howitzer battalion, one 155mm Howitzer battery, one 8-inch Howitzer and one 240mm Howitzer were utilized in the demonstration. Results were extraordinarily effective, very few early bursts occurring and the percentage of effective rounds being eighty-nine per cent for the 105mm Howitzer, eighty per cent for the 155mm Howitzer, ninety-two per cent for the 8-inch Howitzer and 100 per cent for the 240mm Howitzer. A similar demonstration was conducted on 10 December in conjunction with XX Corps Artillery for artillery personnel with that Corps.

A total of eighteen Air OPs was lost during the week just ended, this being the highest percentage of loss in any period to date. Of these, five planes were lost due to enemy action, six because of high winds, five in flying accidents and two due to miscellaneous causes. A tendency was noted on the part of the enemy to reverse his prior practice of silencing his artillery and antiaircraft artillery whenever our Air OPs were aloft. In consequence, our Air OPs encountered in-

Digitized by Google

DECLASSIFIED

DECLASSIFIED

Digitized by Google

ormasing antiaircraft opposition but at the same time were increasingly successful in locating active enemy artillery positions.

10 December. Enemy artillery increasingly interdicted and harassed towns and supply routes in our rear areas utilizing heavy caliber long-range weapons. Fire upon our forward elements continued heavy but was from light caliber weapons exclusively.

The continued heavy fighting was reflected in the ammunition expenditures for the week ending at 100600, though availability continued to be a limiting factor. The figures are as follows:-

	XII Corps	XX Corps
105mm Howitzer	70420	79518
4.5-inch Gun	7490	3665
155mm Howitzer	16866	26095
155mm Gun	7015	3765
155mm Gun (SP)	-	1217
8-inch Howitzer	2443	2951
8-inch Gun	132	151
240mm Howitzer	617	442

11 December. 26th Infantry Division for the fourth successive day launched a limited objective attack, each preceded by a brief but intensive artillery preparation fired by the organic Division Artillery and four battalions of XII Corps artillery. All objectives were attained.

XX Corps experienced severe enemy shelling, an estimated 15,000 rounds falling in the Corps area. The enemy utilized all calibers from 105mm to 210mm and shelled BOUZONVILLE (Q1377) with a 380mm weapon. The enemy fires included an intensive four-hour program in the evening upon our rear area installations, including towns, command posts, highways and crossroads. Lack of current photo cover substantially hampered counterbattery measures but nevertheless as strong a counterbattery program as ammunition availability would permit was instituted immediately.

12 December. Improved weather facilitated new photo coverage that materially assisted counterbattery measures. Enemy artillery fires declined sharply in the XX Corps area, due in part to our counterbattery fires and in part to intensive fighter-bomber bombing and strafing of enemy artillery positions.

A strong, night counterattack against the 35th Infantry Division was repulsed by the defensive fires of the Division Artillery and six supporting battalions of XII Corps artillery. Thereafter a thirteen-battalion time-on-target concentration was fired upon GLIMMERSCHEID (Q5957) following which 35th Infantry Division took the town against light resistance and captured many prisoners.

14 December. 87th Infantry Division and its organic artillery were attached to XII Corps and relieved 26th Infantry Division. The latter returned to METZ (U85) to service and re-fit materiel and assumed the mission of containing the remaining METZ forts under the operational control of III Corps. No substantial changes occurred in the organization for combat of artillery with XII Corps other than to substitute in support of 87th Infantry Division Corps artillery that had been firing in support of 26th Infantry Division.

15 December. 80th Infantry Division commenced to move back into line on the south flank of XII Corps, relieving elements of the 12th Armored Division which thereupon reverted to Seventh U.S. Army. To provide for this change and also for the impending committal of III Corps on the SAAR front, artillery with XII Corps was regrouped as follows:-

General support, reinforcing 35th Infantry Division with one light and two medium battalions - one field artillery group of one light, two medium and one heavy battalion.
General support, reinforcing 80th Infantry Division with one light and one medium battalion - one field artillery group of one light, one medium and one heavy battalion.
General support reinforcing 80th Infantry Division - one field artillery group of two 105mm Howitzer (SP) battalions, one medium battalion and one battery of 155mm Guns (SP).
General support, reinforcing 87th Infantry Division with one light and two medium battalions - 334 Field Artillery Brigade with one light, two medium and one heavy battalion attached.
Corps fire direction center in 35th Infantry Division zone of action - Headquarters and Headquarters Battery, XII Corps Artillery with two heavy battalions and one battery of 8-inch Guns attached.
Corps fire direction center in zone of action of 80th and 87th Infantry Divisions - one field artillery group with one heavy battalion attached.
General support - one field artillery observation battalion with one platoon of topographic engineers attached.

Enemy artillery firing into the XX Corps area increased somewhat, especially at the bridge sites, an estimated 5,000 to 6,000 rounds falling in SAARLAUTERN (Q6879) alone.

16 December. III Corps, with 6th Armored Division attached, was committed in the center of the Army front on the SAAR. Attached initially to the Corps were Headquarters and Headquarters Battery, III Corps Artillery, one 105mm Howitzer battalion, one 155mm Howitzer battalion, one 155mm Gun battalion and one 8-inch Gun battery, all detached from XX Corps, and one field artillery group, one field artillery observation battalion, one armored field artillery battalion and one 4.5-inch Gun battalion, all detached from XII Corps.

One 240mm Howitzer battalion was detached from XII Corps and retained under Army control, being utilized on Military Police duty.

17 December. XX Corps reorganized its front with 5th Infantry Division moving in to the north of 95th Infantry Division and taking over the bulk of its zone. Artillery with XX Corps was accordingly re-grouped as follows:-

General support in zone of 3d Cavalry Group and 90th Infantry Division - one field artillery group of two armored field artillery battalions and one medium battalion.
Attached to 90th Infantry Division - one 105mm Howitzer battalion and one battery, 155mm Guns (SP).
Reinforcing 90th Infantry Division - one field artillery group of two medium battalions.
General support in zone of 90th Infantry Division - one field artillery group of two heavy battalions and one 8-inch Gun battery.
Attached to 5th Infantry Division - one 105mm Howitzer battalion and one battery, 155mm Guns (SP).
Reinforcing 5th Infantry Division - one field artillery group of two medium battalions.
General support in zones of 5th and 95th Infantry Divisions - one field artillery group of three heavy battalions.

Enemy artillery opposition to XX Corps bridgeheads was light and, together with fresh photo coverage, reflected a substantial withdrawal of enemy artillery from the area.

Enemy activity in and around the town of FORBACH (Q3905) was strong so that artillery with III Corps attacked the town repeatedly throughout the day. Infantry patrols sent out in this area were accompanied by artillery forward observers to assure prompt artillery support if and when the patrols should be pinned down.

Artillery ammunition expenditures for the week ending at 170600 were as follows:

	III Corps*	XII Corps	XII Corps
105mm Howitzer	1397	55420	55420
4.5-inch Gun	-	2334	2334
155mm Howitzer	54	18617	18617
155mm Gun	-	5504	5504
155mm Gun (SP)	-	-	-
8-inch Howitzer	-	2138	2138
8-inch Gun	-	196	196
240mm Howitzer	-	700	700

*III Corps was committed on 16 December.

18 December. Planning was already in progress whereby Third U.S. Army would wheel to attack the south flank of the enemy penetration developing against First U.S. Army in the LUXEMBURG - BELGIUM area. 10th Armored Division, in XX Corps reserve, was detached from Third U.S. Army, attached to First U.S. Army and moved north to help stem the enemy onslaught.

Enemy artillery opposition to XX Corps increased somewhat, especially against 90th Infantry Division which was advancing in its DILLINGEN (Q2784) bridgehead. The enemy continued to fire strong harassing and interdiction fires at night. By far the bulk of his fire, however, continued to be received during periods of good daylight visibility.

19 December. III Corps was withdrawn from the SAAR front and moved north to the vicinity of ARLON (P6123). 4th Armored and 80th Infantry Divisions, together with their organic artillery, were detached from XII Corps, attached to III Corps and moved rapidly north from positions on the extreme south flank of the Army.

Artillery with the Army was extensively re-grouped to support these offensive operations. There were attached to III Corps one field artillery group, two 155mm, one medium and one heavy battalion detached from XII Corps and two field artillery groups, one light and one medium battalion detached from XX Corps. In addition, one field artillery observation battalion newly arrived on the Continent and assigned to Third U.S. Army was attached to III Corps. All commenced to move immediately and closed in the vicinity of the III Corps Artillery assembly area at VILLERS (U8198) during the night of 19 - 20 December.

To assure continued efficient operations and prevent the confusion inherent to reorganization, III Corps' former area in the SAAR front together with the bulk of the troops therein passed intact to the control of XII Corps. In addition to 6th Armored Division and its organic artillery, this included one field artillery group, one field artillery observation battalion, one light, one medium and one heavy battalion.

Planning was in progress in anticipation of the probable detachment of VIII Corps to Third U.S. Army. This Corps, spread thinly over a wide frontage, had borne much of the brunt of the enemy attack. It was already clear that artillery with VIII Corps had suffered heavy losses so that steps were initiated to determine the scope thereof with a view to expediting replacement.

There was heavy enemy artillery activity throughout the XII Corps sector, especially in the 35th Infantry Division sector at SAARHAUSEN (Q5157). Enemy firing in the XX Corps bridgehead areas was moderate but increased sharply on the north flank of the Corps in the thinly-held area between the SAAR and MOSELLE RIVERS. This fire in one instance was in the nature of an artillery preparation which, coupled with heavy sounds as if of troop movements at night, made apparent an enemy attempt to simulate an attack in that area.

XX Corps Artillery completed an examination designed to test the efficacy of sound ranging of 100 enemy artillery locations in the area between the MOSELLE and SAAR RIVERS originally reported by sound ranging methods. Positive evidence of occupation by enemy artillery or self-propelled weapons was found in seventy-three locations, evidence of possible occupation in thirteen locations and no evidence of occupation in fourteen positions. Fifty-five of the locations as reported by sound were within 150 yards of the actual locations, the remaining forty-five sound locations being further removed.

20 December. 26th Infantry Division, currently at METZ (U85), was attached to III Corps and commenced to move north.

Artillery with III Corps was moving forward into positions to support the planned Corps attack toward BASTOGNE (P5658). Organization for combat of the Corps artillery was as follows:

Attached to 4th Armored Division - two armored field artillery battalions and one medium battalion.
Attached to 80th Infantry Division - one field artillery group of one light and one medium battalion.
Attached to 26th Infantry Division - one field artillery group of one light and two medium battalions.
General support - one field artillery observation battalion, one field artillery group, two medium and one heavy field artillery battalion.

Enemy artillery activity in the XX Corps bridgehead areas built up gradually throughout the day until in the early evening an average of 600 rounds per hour was falling in the HERZOGF (Q3978) bridgehead. At 2200 hours all XX Corps artillery battalions, embracing all calibers from the 105mm Howitzer to the 240mm Howitzer, fired simultaneously upon twelve enemy artillery locations. The enemy firing ceased.

XII Corps was in the process of relinquishing its area on the south flank of the Army to Seventh U.S. Army preparatory to its own movement to the north. 87th Infantry Division was relieved from attachment to XII Corps and Third U.S. Army and assigned Seventh U.S. Army. As were the 334 Field Artillery Brigade and three heavy artillery battalions. Several small-scale enemy counterattacks occurred in the [illegible] corps sector, each preceded by an intensive artillery preparation.

21 December. [illegible] corps, consisting of 9th Armored Division - [illegible] and 10th Armored Divisions - 28th U.S. [illegible] Division, was detached from First [illegible] Army. Also included were Headquarters and Headquarters Battery, XII Corps Artillery, two field artillery observation battalions, [illegible] field artillery groups, one armored field artillery battalion, one 105mm Howitzer, one 4.5-inch Gun, five 155mm Howitzer, two 155mm Gun, one 155mm Gun (SP) and two 8-inch Howitzer battalions. Elements of five of these battalions were operational in the vicinity of BASTOGNE (P5658). The remaining battalions had been widely scattered by the enemy penetration and were being assembled west of FLORENVILLE (P2525) and temporarily employed for the defense of the MEUSE.

Seventh U.S. Army completed its relief of XII Corps on the SAAR and the Corps, together with all attached artillery and 35th Infantry

Division, commenced to move to the north. To assist the change-over, 6th Armored Division and supporting artillery remained in position on the SAAR, being detached from XII Corps and attached to XX Corps.

95th Infantry Division expanded its sector on the SAAR to include that of the 5th Infantry Division and the latter commenced its withdrawal to move to the north. 76th Infantry Division's sector was also extended to include the area from the SAAR west to the MOSELLE [illegible] heavily held by a screen of heavily forced. To support the new organization in its defense of the SAAR line, artillery with XX Corps was regrouped as follows:-

Attached to 95th Infantry Division - one light artillery battalion.
Attached to 76th Infantry Division - one field artillery group consisting of one light, one medium and one heavy artillery battalion.
General support in area of 76th Infantry Division - one field artillery group consisting of one medium and three heavy artillery battalions.
Attached to 26th Infantry Division - one light artillery battalion.
General support in area of 26th Infantry Division - one field artillery group of two medium artillery battalions.
General support in area of 4th Infantry Division - one field artillery group of three heavy artillery battalions.
Attached to 6th Armored Division - one light artillery battalion.

20 December. The situation in the ARDENNES penetration area continued fluid with the enemy artillery advancing by bounds in rear of the infantry and armor prepared to support when the situation stabilized. Fires of the enemy artillery were sporadic and came almost entirely from light calibers including self-propelled weapons, frequently employing direct fire.

VIII Corps Artillery was progressing well with the task of collecting and re-equipping its scattered units, except of course for those in the BASTOGNE (P5668) pocket. It proved possible to fill promptly all critical shortages of Signal, Quartermaster and Ordnance equipment except for motor vehicles and certain primary weapons. One field artillery group, one field artillery observation battalion and three heavy artillery battalions were already in operational condition and were therefore detached from VIII Corps and attached to III Corps to support the latter's offensive.

XII Corps and its artillery units completed their move to the north and closed in the area just east of III Corps. Artillery with the Corps was organized as follows to support the forthcoming attack:-

General support, reinforcing 5th Infantry Division with one light and two medium battalions - one field artillery group of one light, two medium and one heavy battalion.
General support, reinforcing 10th Armored Division - one field artillery group of three light and one medium battalion.
General support, reinforcing 4th Infantry Division with one light and one medium battalion - one field artillery group of one light and two medium battalions.
General support, reinforcing 4th Infantry Division with one medium battalion - one field artillery group of one medium and two heavy battalions.
Attached to 2d Cavalry Group - one light battalion.

One additional field artillery group was employed as a second Corps Artillery fire direction center in the eastern part of the Corps area. Included in this organization for combat were one light and one medium battalion of the 28th Infantry Division. The enemy penetration had separated these battalions from the Division and they had subsequently been recentered in the new XII Corps area. 28th Infantry Division was currently re-grouping along the MEUSE and pending its recommittal to action, these two battalions were temporarily detached and attached to XII Corps.

XX Corps withdrew from two of its three bridgeheads over the SAAR to take up more favorable holding positions. Only the SAARLAUTERN (Q2977) bridgehead was maintained. XX Corps artillery maintained continuous smoke screens to cover these withdrawals. Much of the artillery with XX Corps was engaged in displacing the better to support the new defensive positions.

One armored field artillery battalion was detached from XX Corps and attached to III Corps and one 155mm Howitzer battalion, newly assigned to Third U.S. Army and arrived in the Army area, was attached to III Corps.

21 December. A strong enemy attack upon our troops in the BASTOGNE (P5668) area was preceded by an intensive artillery preparation fired largely by tanks and self-propelled weapons. III Corps' advance to the north was encountering stiff resistance but only slight artillery fires from single pieces of light caliber.

One field artillery group and one 4.5-inch Gun battalion, assigned to First U.S. Army but separated therefrom by the enemy penetration, arrived in the VIII Corps assembly area in the vicinity of FLAMIERVILLE (P5824). Twelfth U.S. Army Group was advised and permission to retain these units was requested. This was granted and the two units were detached from First U.S. Army, attached to Third U.S. Army and in turn reattached to VIII Corps.

10th Armored Division, composed of elements of the 9th and 10th Armored Divisions, attacked following a 45-minute artillery preparation fired by the organic artillery and four battalions of XII Corps artillery. Enemy artillery opposition to the attack was moderate, consisting largely of harassing fires against our leading elements. XII Corps Artillery, in its new area on the LUXEMBOURG front, continued its established policy of intensive harassing and interdiction fires on a 24-hour basis delivered upon all towns and buildings within artillery range that might otherwise afford shelter to the enemy.

Seventh U.S. Army units began to relieve 6th Armored Division on the south flank of XII Corps so as to free this Division too for employment against the penetration in the north.

The one 8-inch Gun battalion with the Army, the three firing batteries of which had been employed on one per Corps basis on the SAAR front, was attached in toto to XX Corps.

22 December. The enemy heavily bombed our troops in the BASTOGNE (P5668) pocket but continued to employ as artillery only light caliber self-propelled and tank weapons. III Corps, employing 4th Armored and 80th Infantry Divisions in its advance toward BASTOGNE, encountered increasingly heavy resistance as its attack progressed to the north.

Enemy artillery opposition to the attack of 5th Infantry and 10th Armored Divisions in the XII Corps area was strong, especially during daylight, and extensive use was made of 210mm Nebelwerfers. The enemy launched two strong counterattacks both of which were repelled with the help of strong support from artillery with XII Corps.

All artillery with XX Corps was engaged in organizing for defense of the SAAR line, reconnoitering and organizing both alternate and delaying positions. Enemy artillery in this sector was generally quiet.

Artillery ammunition supply became increasingly critical in consequence of the movement of the great bulk of Third U.S. Army to the north. Supply units followed with maximum speed but delay in their opening in the northern area was inescapable in view of the great distances and great amount of supplies involved. For several days but a single Ammunition Supply Point was available to III, VIII and XII Corps between them so that stocks became and remained extremely low. The nearest Communications Zone depot available involved approximately a forty-hour round trip for the ammunition trains and so was utilized only in occasional emergencies. Close contact was maintained between Ordnance and Artillery personnel at both the corps and army levels and in consequence of the diligence of all concerned, the situation had so eased by 26 December that it was not thereafter a problem.

The Posit fuse having been released for operational use by Supreme Headquarters Allied Expeditionary Force, the limited quantities already available within the using units were initially used for light harassing and interdiction fires. Use of the new fuse expanded considerably as increased ammunition stocks were moved up into the northern sector.

Artillery ammunition expenditures for the week ending at 240600 remained substantially as heavy as in preceding weeks which, in view of the fact that the greatest part of Third U.S. Army was moving at some time or other during the week, indicates the severe nature of the fighting. Expenditures were as follows:-

	III Corps	XII Corps	XX Corps
105mm Howitzer	9647	50157	51349
4.5-inch Gun	427	1793	2002
155mm Howitzer	2452	16741	12652
155mm Gun	1130	2227	2378
155mm Gun (SP)	-	4053	1050
8-inch Howitzer	261	-	1207
8-inch Gun	26	-	116
240mm Howitzer	-	193	542

24 December. VIII Corps artillery units, except for those within the BASTOGNE (P5668) pocket, continued to re-group and rehabilitate in the area west of FLAMIERVILLE (P5824) while at the same time assisting to screen the approaches to the MEUSE. VIII Corps Air OPs maintained continuous reconnaissance patrols north, northeast and northwest of BASTOGNE (P5668).

Severe enemy attacks employing large numbers of tanks were all successfully repulsed by the forces in the BASTOGNE (P5668) pocket, in some instances after dangerous local penetrations. Radio communication was successfully established between the approaching 4th Armored Division and the BASTOGNE forces and this medium was utilized to enable both 4th Armored Division and III Corps Artillery to fire extensively in support of the encircled forces.

A sharp decrease in enemy artillery fires occurred throughout the XII Corps area but Nebelwerfer fires continued to be very active.

Seventh U.S. Army completed taking over the southern portion of the XX Corps area on the SAAR, relieving 6th Armored Division which thereupon moved back to METZ (U85) for re-fitting and maintenance. One light field artillery battalion previously attached to 6th Armored Division was relieved and attached to 95th Infantry Division.

A compilation of counterbattery records revealed that XX Corps had been opposed at one time or another by twenty separate types of enemy field artillery weapons. These ranged in caliber from 75mm and 76.2mm to 380mm and included weapons, in addition to German, of French, Russian and Italian origin.

26 December. Combat Command B, 4th Armored Division succeeded in establishing contact with the 101st Airborne Division and other units in the BASTOGNE (P5668) pocket. ASSENOIS (P5454), the last barrier separating the two forces, had been attacked with an artillery concentration of four battalions, ten volleys upon the heels of which the infantry and armor moved into the town against shattered resistance. 4th Armored Division Artillery and supporting III Corps artillery had continued to fire in support of the forces within the pocket prior to the juncture. The last stages of 4th Armored Division's advance had been accomplished against the most intense opposition and enemy artillery fires received had been the most severe ever experienced by this Division.

Both 26th and 80th Infantry Divisions were engaged in heavy fighting. 80th Infantry Division Artillery fired a thirty-minute preparation in support of the attack of the 317th Infantry. A night counterattack against the 319th Infantry was broken up by two artillery battalions firing their normal barrages. 26th Infantry Division Artillery and six battalions of III Corps artillery participated in several time-on-target concentrations upon ESCHDORF (P7044) following which infantry took the town in a pre-dawn attack.

35th Infantry Division, en route north, was attached to III Corps. 10th Armored Division, with the exception of its elements in the BASTOGNE (P5668) area, was relieved from XII Corps and moved back to METZ (U85) for refitting. 6th Armored Division was attached to XII Corps and commenced moving north from METZ.

The enemy fought a stubborn delaying action against XII Corps' advance toward the SAUER RIVER. Bitter house-to-house fighting occurred in BERDORF (L4035), strongly supported by our artillery and with only light enemy artillery opposition. On no less than four separate occasions concentrations of enemy infantry were attacked and dispersed by our massed artillery fires.

The picture of artillery losses in the penetration area had by now clarified and showed that losses, while severe, were not as heavy as might have been anticipated. Major losses of primary weapons included, each in separate battalions, seventeen 105mm Howitzers (SP), five 106mm Howitzers, ten 4.5-inch Guns, one 155mm Howitzer, eleven 155mm Howitzers, one 155mm Gun, three 155mm Guns and nine 8-inch Howitzers. Seven of the 8-inch Howitzers had been recovered by First U.S. Army and were en route to Third U.S. Army through Ordnance evacuation channels. Other losses included 148 trucks of less than two and one-half tons, 100 trucks of two and one-half tons or greater, twenty-three M5 tractors, fifteen M4 tractors and twelve liaison-type aircraft. There were in addition large losses of Signal, Engineer and Quartermaster equipment, both personal and organizational. Artillery personnel of both corps and army worked in constant and close coordination with the supply services and virtually all items proved to be quickly replaceable and were so replaced. Delay in replacement was encountered only in the case of 4.5-inch Guns, 155mm Howitzers, 155mm Guns and the larger trucks.

One field artillery group and three artillery battalions, each composed of negro enlisted personnel, had suffered personnel losses that could not be replaced, there being no negro artillery personnel replacements available in the Theater. Permission was therefore requested to de-activate one battalion so as to provide replacements for the remaining two battalions and the group. Pending War Department approval thereof, Twelfth U.S. Army Group authorized that the personnel of the one battalion be placed on special duty to bring the other units concerned back up to strength. Transfer of this battalion's equipment on a similar basis was also authorized.

Digitized by Google

Due to the lack of replacement 4.5-inch Guns, permission was also requested to convert the 4.5-inch Gun battalion into a 155mm Howitzer battalion. This however was refused by Twelfth U.S. Army Group because of a comparable shortage of 155mm Howitzer and the relative availability of ammunition in the two calibers.

27 December. Heavy fighting continued in the BASTOGNE (P5668) area with heavy enemy counterattacks against the left side of 4th Armored Division's narrow corridor into the former pocket. Strong artillery support was employed, all counterattacks were beaten back and the corridor was firmly established. Numerous enemy artillery units had been identified in the area through Prisoners of War, but enemy firing continued to be confined to that of tanks and self-propelled weapons. The troops in the pocket were placed under the operational control of VIII Corps and 17th Airborne Division relieved the latter in the mission of protecting the approaches to the MEUSE. It was apparent however that the stand at BASTOGNE had dulled the power of the enemy penetration and that it had lost its momentum.

Two strong counterattacks were also launched against 26th Infantry Division but both were repelled by the fires of the Division Artillery and six battalions of supporting III Corps artillery. Our artillery fires were extremely active throughout this area and were measurably aided by clear weather and air observation.

80th Infantry Division, one field artillery group, one light battalion and one medium battalion were detached from III Corps and attached to XII Corps, which thereupon reorganized its artillery for combat as follows:-

General support, reinforcing 80th Infantry Division - one field artillery group of one light, one medium and two heavy battalions.
General support, reinforcing 4th and 5th Infantry Divisions each with two battalions - one field artillery group of one light and three medium battalions.
General support, reinforcing 2d Cavalry Group - one field artillery group of one light and two medium battalions.
Corps fire direction center in zone of 80th Infantry Division - one field artillery group with one heavy battalion attached, supported by one field artillery observation battalion with one platoon of topographic engineers attached. 6th Armored Division Artillery and one field artillery group of two armored field artillery battalions were to respond to calls of this group for fire from present positions.
Corps fire direction center in zones of 4th and 5th Infantry Divisions and the corresponding sector - Headquarters and Headquarters Battery, XII Corps Artillery with two heavy battalions attached and one field artillery observation battalion in support.

Included in this organization for combat were two heavy battalions that were detached from XX Corps and attached to XII Corps.

Enemy artillery activity in the XX Corps sector was virtually negligible, the bulk of it falling in SAARLAUTERN (Q2879) and amounting to only 100 rounds over the 24-hour period. Enemy air activity was widespread throughout the Corps area, however, with numerous instances of bombing and strafing of troop columns, supply points, command posts and artillery positions.

Elements of two field artillery observation battalions which had fallen back into Third U.S. Army's area in the wake of the enemy penetration were detached and attached to First U.S. Army and commenced their movement north.

28 December. The enemy reverted to a defensive attitude in the VIII Corps sector in the vicinity of ST HUBERT (P5161). Two organic artillery battalions of the 26th Infantry Division previously operational with XII Corps were detached and rejoined the Division under VIII Corps. One field artillery group, one field artillery observation battalion, one armored field artillery battalion and two heavy artillery battalions, all previously operating with III Corps, were detached and reattached to VIII Corps.

Enemy artillery activity in the III Corps area declined sharply and was extremely light, coming from single pieces.

XII Corps' attack to the SAUER RIVER took ECHTERNACH (L0535). Extremely heavy enemy troop and vehicular movements in DIEKIRCH (P5642) were attacked with massed time-on-target concentrations and dispersed with heavy casualties. An estimated thirty battalions of enemy artillery were opposed to XII Corps firing heavy harassing and interdiction fires and, occasionally, large counterbattery concentrations. Four liaison-type aircraft were lost to enemy artillery fire that landed on the 80th Infantry Division airstrip.

In the XX Corps sector, enemy artillery activity continued light and enemy air activity heavy. The enemy aircraft showed no disposition, however, to attack our Air OPs.

29 December. 6th Armored Division was detached from XII Corps and attached to III Corps.

A sharp counterattack was launched against 80th Infantry Division but was broken up by the defensive fires of the Division Artillery which inflicted many casualties and resulted in the taking of a substantial bag of prisoners. Enemy artillery opposing XII Corps continued to fire largely upon our supply and communications routes.

30 December. VIII Corps, employing the recently attached 11th Armored and 87th Infantry Divisions, attacked at 0730 in the direction of ST HUBERT (P5161) and HOUFFALIZE (P6171). 101st Airborne Division in the area of BASTOGNE (P5668) supported the right flank of the operation and 28th Infantry Division the left flank. No artillery preparation was fired and no fire contact with the enemy was established until late in the day in the vicinity of REMAGNE (P3955) where heavy fighting developed. The town changed hands several times before we finally secured it and enemy artillery reaction to its capture was prompt and severe. VIII Corps Artillery was organized to support the attack as follows:-

Attached to 87th Infantry Division - one light battalion.
General support, reinforcing 87th Infantry Division - one field artillery group of two medium battalions.
Attached to 11th Armored Division - one armored field artillery battalion.
General support, reinforcing 11th Armored Division - one field artillery group of one medium and one heavy battalion.
Attached to 28th Infantry Division - one light battalion.
Attached to 101st Airborne Division - two medium battalions.
General support - one field artillery observation battalion, one field artillery group and one heavy battalion.

Included in this organization were one light and one medium battalion of the 28th Infantry Division which were attached to other divisions.

III Corps re-grouped its artillery to support its offensive to cut off the enemy pocket southeast of BASTOGNE (P5658) as follows:-

Attached to 26th Infantry Division - one medium battalion.
Attached to 35th Infantry Division - one medium battalion.
Attached to 6th Armored Division - one field artillery group of two armored field artillery battalions and two medium battalions.
General support - one field artillery group of one medium and three heavy battalions.

An extremely heavy tank counterattack was launched against the 35th Infantry Division, pressing against the enemy pocket from the south. All III Corps and divisional artillery, including that of the 4th Armored Division, fired in support of the defense and the counterattack was smashed with heavy losses.

XII Corps continued its program of intensive harassing and interdiction fires, employing ammunition in the ratio of one-third fuse quick, one-third fuse delay and one-third Posit fuse. Initial results with the Posit fuse seemed extraordinarily effective though so much of the firing with this fuse was done with unobserved methods that no positive evaluation could yet be made.

31 December. Enemy artillery firing was relatively light in the BASTOGNE (P5658) area but increased heavily against 87th Infantry Division, notably in the vicinity of NOMERT (PL553). Severe enemy counterattacks were launched against MOIRCY (P3757) and ACULA (PL357) but were repulsed with strong support from divisional and supporting VIII Corps artillery and the attack continued.

III Corps artillery fired strongly to repulse a heavy dawn counterattack against 26th Infantry Division which was pressing against the northeast shoulder of the enemy pocket southeast of BASTOGNE (P5658). Observation was excellent and artillery with the Corps fired repeatedly on numerous enemy tank and troop concentrations. Our advancing troops subsequently counted in excess of 100 enemy dead in one such area. Enemy fires, and particularly those of Nebelwerfers, increased considerably and continued to be primarily harassing and interdictory in nature.

Ammunition expenditures for the week ending at 310600 reflect the generally heavy firing in the ARDENNES area, the figures being as follows:-

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	1211	10242	-	-
105mm Howitzer, M2	77680	20536	84328	25061
105mm Howitzer, M3	-	1395	-	-
4.5-inch Gun	2941	0	2660	645
155mm Howitzer	18685	8025	31520	7336
155mm Gun	6941	1259	6053	998
155mm Gun (SP)	-	2025	-	993
8-inch Howitzer	1135	0	819	1205
8-inch Gun	-	-	-	122
240mm Howitzer	-	-	247	403

Throughout the period, the outstanding events of the month, from a field artillery standpoint, were of course the swift change in direction of Third U.S. Army's attack and the series of successful attacks to the north that followed.

The enemy attack was launched against First U.S. Army on 16 December. Within forty-eight hours Third U.S. Army was on the move. The left flank corps of the Army became the right flank and the Army attack shifted a full ninety degrees from due east to due north. In all, two corps and eight divisions, together with fifty-three artillery battalions made the move from the SAAR RIVER to the ARDENNES, a move of eighty or more miles including the crossing of the MOSELLE RIVER over but three available bridges. Despite the magnitude of the movement, all artillery units succeeded in following closely behind the supported units and without exception fired in prompt and effective support.

By 20 December 4th Armored and 80th Infantry Divisions were advancing to the attack in combat formation, closely followed by eighteen battalions of field artillery. Additional divisions and additional field artillery battalions entered the ever-intensifying struggle immediately upon arrival in the area so that by 27 December, when the relief of BASTOGNE (P5668) had been firmly established, three divisions and no less than thirty-five field artillery battalions were engaged in the action. These battalions were firing in the neighborhood of 19,000 rounds of ammunition daily.

The BASTOGNE operation was but one facet of the Army's general offensive in the ARDENNES for both XII and VIII Corps were rapidly committed in the area, the former immediately as its troops arrived from the south, the latter as soon as its scattered troops had been assembled and re-fitted. XII Corps, employing three divisions and fifteen battalions of Corps artillery in support, attacked on 23 December and drove gradually but steadily forward through eastern LUXEMBOURG to clear the enemy south of the SAUER RIVER. III Corps attacked following the relief of BASTOGNE (P5658) to clear the strong enemy forces from the pocket south and east of BASTOGNE, employing three divisions with ten battalions of Corps artillery in support. VIII Corps, which had conducted the defense of the MEUSE coincident with its re-fitting, attacked west of BASTOGNE on 29 December with three divisions and ten battalions of Corps artillery to drive to the north and east. The period thus ended with heavy offensive fighting in progress along the entire ARDENNES front with heavy supporting fires from the artillery with the Army.

CHAPTER 8
JANUARY OPERATIONS

1 January. Heavy fighting was in progress throughout the ARDENNES area. VIII Corps' left flank encountered a determined enemy, strongly supported by artillery, in the vicinity of ST HUBERT (P5161) and HATRIVAL (P6959). A strong enemy counterattack was directed against CHENOGNE (PL867). VIII Corps' right flank effort to maintain and extend the BASTOGNE (P5668) [illegible] heavily opposed and subjected to repeated enemy counterattacks preceded by intensive artillery preparations therefor. [illegible] from those in support of counterattacks, were [illegible] exceptionally strong enemy air at NEUFCHATEAU [illegible] bridges at FLORENVILLE (P6525) and LA CUISINE (P6520).

III Corps was heavily engaged in the [illegible] and obliterate the enemy pocket southeast of BASTOGNE (P5658). [illegible] Armored Division, with four battalions of III Corps artillery [illegible], was driving against the northwest shoulder of the pocket. 35th and 26th Infantry Divisions, each with one battalion of III Corps artillery attached, were driving against the pocket from the south and northeast respectively. Four battalions of III Corps artillery were in general support of the action.

Three strong counterattacks were launched against 26th Infantry Division but all were repulsed with strong artillery supporting fires. 35th Infantry Division Artillery, reinforced by the organic artillery of 4th and 6th Armored Divisions and five battalions of III Corps artillery, fired extensively upon the towns of LUTREBOIS (P5653), LUTREMANGE (P5850) and VILLERS-LA-BONNE (P5750). Two large concentrations of enemy tanks were also attacked and dispersed with at least two tanks known to have been destroyed. Enemy artillery in the III Corps area fired only moderately but Nebelwerfer fires were heavy, in one instance an estimated 240 rounds falling in HONVILLE (P5547) within a period of less [illegible]

DECLASSIFIED

Digitized by Google

On the eastern flank of the ARDENNES area XII Corps continued its offensive to close upon the SAUER RIVER against strong resistance. The enemy strongly defended its bridgehead at HASSELBURG (L1124). Enemy artillery was especially active against 5th Infantry Division, including some counterbattery fires, but was relatively light throughout the balance of the Corps area. Artillery with XII Corps continued its accustomed program of long-range harassing and interdiction fires upon all towns in enemy territory and also fired extensive counterbattery fires.

The rough character of the ARDENNES terrain and the heavy snow unnecessarily canalized enemy movement to a very few primary highways replete with defiles, bridges and similar bottle necks. Extreme cold weather forced the enemy into towns making them most profitable targets. An extensive program of long-range harassing and interdiction fires was therefore instituted upon all towns, crossroads and highways in the enemy area. Artillery with III, VIII and XII Corps all participated in this program with particular emphasis being paid, pursuant to instructions from Twelfth U.S. Army Group, to the HOUFFALIZE (P6171) - BASTOGNE (P5656) road from HOVILLA (P5844) to the road junction at (P6187IC). In accordance therewith one 155mm Gun battalion was attached to the 101st Airborne Division and emplaced far forward in the BASTOGNE sailient to interdict this stretch of highway.

2 January. The enemy attitude in the VIII Corps area continued to be one of aggressive defense including several counterattacks which were repulsed with the assistance of heavy fires from our supporting artillery. Artillery with VIII Corps intensified its harassing and interdiction program, firing a total of 4,135 rounds upon two railroad stations, four towns, and sixty-seven road junctions in a program coordinated with that of XXX British Corps on its left. Enemy artillery activity was relatively light with the exception of 15cm, 17cm and 21cm weapons firing harassing missions into the BASTOGNE (P5658) salient from the west, north and east. Our forces in the BASTOGNE area were also subjected to heavy enemy air attack.

28th Infantry Division relieved 17th Airborne Division from its mission of protecting the approaches to the MEUSE RIVER and the latter moved forward to relieve 11th Armored Division and Combat Command A, 9th Armored Division which reverted to VIII Corps reserve.

In the III Corps area heavy counterattacks against 6th Armored Division in the vicinity of MICHAMPS (P6142) were smashed by the massed artillery fires of 6th Armored Division Artillery together with important support from artillery with VIII Corps, including that of 101st Airborne Division. A large tank and infantry concentration forming in the vicinity of HARDIN (P6056) was likewise dispersed by the artillery fire of these units.

Both 35th and 26th Infantry Divisions attacked following an extensive artillery preparation fired by the organic divisional artillery and supporting III Corps artillery. The Corps preparation fires were concentrated upon eighteen enemy artillery locations in consequence of which enemy artillery reaction to the attack was but moderate. The organic artillery of the 80th Infantry Division and one heavy artillery battalion, all attached to XII Corps, joined in the preparation fired for the 26th Infantry Division attack.

Enemy artillery fires in the XX Corps sector were desultory with the exception of moderate fire upon the extreme south flank of the Corps. 95th Infantry Division Artillery and one battalion of attached XX Corps artillery joined in the preparation fires for a limited attack on the north flank of XV Corps, attached to Seventh U.S. Army.

3 January. 17th Airborne Division relieved 11th Armored Division in the VIII Corps area, the organization of the artillery with VIII Corps remaining substantially unchanged. Heavy enemy counterattacks against the 87th Infantry and 11th Armored Divisions were repulsed with the assistance of the defensive fires of the organic divisional artillery.

There was a sharp increase in firing by the enemy artillery. An unsuccessful counterattack against LONGCHAMPS (P5363) was supported with the fires of 15cm weapons. Enemy harassing fires fell in the vicinity of BASTOGNE (P5658) and at RECHTVAL (PL558) and 101st Airborne Division received heavy Nebelwerfer fires.

A severe enemy counterattack, employing fifty tanks supported by a regiment of infantry, was launched against the BASTOGNE (P5658) salient in the vicinity of HONVILLE (P5464) and LONGCHAMPS (P5363). A one-hour preparation of extremely heavy artillery and mortar fires upon our forward elements preceded the enemy attack. All available artillery with both VIII and III Corps fired in support of the defense. The enemy nevertheless succeeded in a temporary penetration of both towns before being contained and driven back.

High winds, snow and fog adversely affected both observation and wire communications. Icy roads and snow seriously hampered initial laying, maintenance and recovery of wire. Many breaks in wire were caused by tracked vehicles and there was also considerable evidence of sabotage, one line being cut in no less than eleven places. Radio communications however were generally good despite the adverse weather conditions.

35th Infantry Division in III Corps area continued to press strongly against the south flank of the enemy pocket southeast of BASTOGNE (P5658), this offensive being supported by the organic artillery of 35th and 26th Infantry Divisions, 4th and 6th Armored Divisions and all III Corps artillery battalions. Artillery with III Corps fired an extensive program of harassing and interdiction fires. Enemy artillery activity consisted largely of harassing and interdiction fires on road junctions and towns in III Corps rear areas. Extremely heavy fire came from the enemy pocket southeast of BASTOGNE but consisted almost entirely of enemy self-propelled artillery and infantry cannon, the field artillery in the area apparently having displaced to the northeast.

4 January. 87th Infantry and 17th Airborne Divisions attacked on the left flank of VIII Corps in the wake of small-scale artillery preparations. Vigorous enemy opposition was encountered including both tank and infantry counterattacks, strongly supported by enemy artillery. These were repelled after minor penetrations with the assistance of sharp fires from the organic divisional artillery. In one instance an infantry officer adjusted the defensive fires of 87th Infantry Division Artillery entirely by sound to repel an enemy counterattack.

Large scale enemy counterattacks continued in the area of the BASTOGNE (P5658) salient and one was able to achieve a temporary penetration of CHAMPS (P5162) before being expelled by 101st Airborne Division with the assistance of the organic divisional and supporting VIII Corps artillery. Heavy concentrations of enemy troops in the vicinity of LONGCHAMPS, indicative of a second and coordinated counterattack, were heavily attacked by massed artillery fires which succeeded in keeping them off balance. No counterattack was launched in that area. 6th Armored Division, attached to III Corps, assisted the defensive fires of 101st Airborne Division.

The activity of enemy artillery opposed to III Corps increased, especially against the forward elements of 6th Armored Division, and included a twenty-minute preparation for a counterattack. The massed fires of seven artillery battalions were instrumental in repelling the counterattack. 26th Infantry Division also experienced a severe enemy counterattack but this too was repulsed with the assistance of the fires of the Division Artillery and four III Corps artillery battalions.

One 155mm Howitzer battalion, assigned to Third U.S. Army and newly arrived in the Army area, was attached to III Corps.

5 January. The tempo of enemy artillery fires in the VIII Corps area continued to increase, especially in the BASTOGNE (P5658) area, and consisted of harassing and interdiction missions as well as some massed fires against our forward elements.

Artillery with 87th Infantry Division fired heavily to repel an enemy tank counterattack and also attacked several enemy troop assemblages with time-on-target concentrations. A strong night counterattack against 17th Airborne Division at WILLERONT (P5659) achieved localized gains before being halted with heavy losses to our forces.

Artillery with 101st Airborne Division fired upon a large-scale counterattack while forming and so completely dispersed the enemy that the counterattack was not launched. All artillery with 6th Armored Division, attached to III Corps, shifted its direction of fire 3200 mils to support the defensive fires of 101st Airborne Division, attached to VIII Corps. 6th Armored Division Artillery and four battalions of III Corps artillery in support thereof also fired strongly to repel counterattacks against 6th Armored Division in the vicinity of HARDIN (P6056).

35th Infantry Division continued to attack from the south with heavy artillery support in the vicinity of MARLANGE (P6049), TAVERNY (P6051), VILLERS-LA-BONNE (P5750) and LUTREMANGE (P5950). Strong counter-mortar fires were also fired.

BERLE (P5652), a heavily fortified enemy strongpoint, blocked the advance of the 26th Infantry Division. Accordingly an 8-inch Howitzer battalion made a precision adjustment upon each of the town's twenty-four houses in turn. The town was demolished.

Artillery with III Corps was organized for combat as follows:

Attached to 6th Armored Division - one field artillery group consisting of two armored field artillery battalions and two medium battalions.
Attached to 35th Infantry Division - one medium artillery battalion.
Attached to 26th Infantry Division - one medium artillery battalion.
General support - one field artillery observation battalion and one field artillery group consisting of two medium and two heavy battalions.

Activity in the XII Corps zone consisted largely of vigorous patrol actions supported by increased enemy artillery and by heavy XII Corps artillery. An estimated seventeen battalions of enemy artillery were opposed to the Corps, emplaced well behind the enemy lines in defensive dispositions.

To assure the fullest and most effective support of our attack upon the enemy pocket southeast of BASTOGNE (P5658), orders were issued directing XII Corps Artillery to support III Corps by fires from positions within its zone, VIII Corps Artillery to support III Corps by counterbattery fire or known hostile artillery positions, necessary coordination to be accomplished by command liaison between the Corps Artillery Commanders concerned.

6 January. In the VIII Corps sector 87th Infantry Division attacked to secure TILLET (PL959). An extensive schedule of prearranged supporting fires was fired by the organic artillery of the 87th Infantry, 17th Airborne and 11th Armored Divisions and seven battalions of supporting VIII Corps artillery. The fires were placed upon the town and all roads leading thereto. Good observation prevailed and strong fire support continued upon both targets of opportunity and prearranged targets. The enemy conducted an aggressive defense heavily supported by light caliber self-propelled artillery fires upon our leading elements. The fighting was violent and the town changed hands repeatedly before it was finally secured on 10 January.

No less than four counterattacks were launched against 6th Armored Division in the III Corps area. The defensive fires of the organic and supporting artillery of 6th Armored and 101st Airborne Divisions, the latter attached to VIII Corps, played a large part in repelling these attacks.

80th Infantry Division launched a surprise pre-dawn attack without artillery preparation. Enemy artillery reaction to the attack was strong and prompt but a prearranged schedule of counterbattery fires fired by XII Corps artillery quickly achieved and maintained artillery superiority so that initial objectives were rapidly secured. The enemy counterattacked vigorously but was repelled by the organic division artillery firing its normal and two emergency barrages.

In pursuance of its program of long-range harassing and interdiction fires, XII Corps Artillery emplaced one 155mm Gun far forward for the purpose of harassing the towns of BITBURG (L1353) and TRIER (L2129).

7 January. VIII Corps' offensive on its left flank continued with the artillery firing several preparations for localized attacks as well as defensive fires to repel counterattacks. The long-range harassing and interdiction fires of artillery with VIII Corps were continued with increased emphasis upon the road net leading into HOUFFALIZE (P6171).

Artillery with III Corps participated extensively in the defensive fires of both VIII and XII Corps to repel sharp enemy counterattacks. The organic artillery of 6th Armored Division and four attached III Corps artillery battalions fired in support of 17th Airborne Division, attached to VIII Corps. Organic artillery of 26th Infantry Division and one attached III Corps artillery battalion fired in support of 80th Infantry Division, attached to XII Corps.

The enemy having been cleared south and west of the SAUER RIVER in the Corps zone, artillery with XII Corps was reorganized to support its defense and the planned attack to the north, as follows:

General support, reinforcing 80th Infantry Division with two light and one medium battalion - one field artillery group consisting of two light, one medium and one heavy battalion.
General support, reinforcing 5th Infantry Division with one light and two medium battalions - one field artillery group consisting of one light, two medium and one heavy battalion.
General support, reinforcing 2d Cavalry Group with one light battalion and 4th Infantry Division with two medium battalions - one field artillery group consisting of one light and two medium battalions.
Corps fire direction center in eastern part of Corps zone - Headquarters and Headquarters Battery, XII Corps Artillery with one heavy artillery battalion attached and one field artillery observation battalion in support.
Corps fire direction center in western part of Corps zone - one field artillery group with one heavy battalion attached and one field artillery observation battalion in support.

9Lth Infantry Division, newly assigned to Third U.S. Army and newly arrived in the Army area, was attached to XX Corps. 90th Infantry Division was detached from XX Corps and commenced to move north to the ARDENNES area. One light artillery battalion was detached from 90th Infantry Division and attached to 9Lth Infantry Division. Enemy artillery activity was negligible throughout the XX Corps area.

Digitized by Google

Artillery ammunition expenditures for the seven-day period ending at 070600 January represented the most intensive firing in the operational history of Third U.S. Army to date, a total of 430,619 rounds being fired. The heavy volume i. attributable entirely to the fighting in the ARDENNES area. Fire in support of XX Corps' holding operation on the SAAR front being relatively light. Prisoner of War reports and inspection of the battlefield bore witness to the devastating effect of our artillery fire on German forces in the salient. Personnel and vehicle casualties were extremely high and there can be no doubt that the effectiveness of the artillery massed on the south of the ARDENNES salient contributed greatly to breaking the back of the German offensive. The figures are as follows:

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	-	34073	-	-
105mm Howitzer, M2	120825	70176	58498	19915
105mm Howitzer, M3	-	4135	-	-
4.5-inch Gun	6460	4820	2821	729
155mm Howitzer	30209	14751	22195	6132
155mm Gun	8627	-	5911	984
155mm Gun (HP)	-	2829	-	642
8-inch Howitzer	2540	-	1967	517
8-inch Gun	-	-	-	0
240mm Howitzer	-	-	556	167

8 January. Although heavy fighting developed in the course of VIII Corps' offensive on its left flank, enemy artillery activity declined sharply. A limited objective night attack by 17th Airborne Division encountered no enemy artillery reaction and an enemy counterattack that succeeded in temporary occupation of BOIREHUE (P5859) was not supported by artillery. A strong enemy night counterattack employing eighteen tanks was launched in a southwesterly direction from FLAMIERGE (P4961). It was repelled by 17th Airborne Division with a total of nine tanks destroyed.

A heavy four-hour counterattack against III Corps east of HEFFLE (P5857) gained some ground initially. A vigorous artillery preparation was fired following which a dawn attack by 6th Armored Division succeeded in regaining and consolidating the original positions. Artillery with III Corps, including that of the 20th Infantry Division, also fired in support of XII Corps to repel an enemy counterattack in that area.

Enemy artillery was active against the forward elements of XII Corps on its north flank but the east flank along the SAURE RIVER remained quiet. XII Corps' program of harassing and interdiction fires, although substantially curtailed to conserve ammunition, nevertheless continued intensive.

Air OP Bulletin Number 5, Annex 15 copy attached, was published.

9 January. III Corps launched a coordinated attack to cut off and eliminate the enemy pocket southeast of BASTOGNE (P5658), employing 6th Armored, 35th Infantry and 26th Infantry Divisions. 90th Infantry Division, newly attached to III Corps, passed through and attacked on the right flank of the 26th Infantry Division. The attack was heavily supported by all artillery with III Corps firing both prearranged and on call missions against enemy infantry and artillery installations together with harassing and interdictory fires on the enemy's rear areas. Six battalions of XII Corps artillery also fired in support of III Corps' attack. Enemy artillery reaction to the attack was surprisingly light with indications that the bulk of the enemy artillery in the pocket south of a line running from HARDIN (P6056) to HOTEUX (P6752) had been withdrawn.

Coordinated with III Corps' attack was an attack on the right flank of VIII Corps by 101st Airborne Division and 4th Armored Division, preceded by a short but intensive artillery preparation upon enemy artillery locations. Artillery with VIII Corps also fired a brief preparation on enemy artillery installations in support of the III Corps attack.

Enemy artillery activity in the XX Corps area continued to be light, an average of approximately 100 rounds per day landing throughout the entire Corps area. Artillery with 95th Infantry Division joined in the artillery preparation for a local attack made by Seventh U.S. Army.

10 January. VIII Corps artillery attacked seventeen enemy antiaircraft artillery positions in support of an air attack upon HOUFFALIZE (P6171). An Air Force attack upon FLAMIERGE (P4761) flushed fourteen tanks and an estimated 500 infantry out of the town which were then attacked by both the Air Force and VIII Corps artillery.

87th Infantry Division succeeded in seizing and securing TILLET (P4259), advancing upon the town under cover of a smoke screen maintained by the organic division artillery and supporting VIII Corps artillery. 101st Airborne Division's attack west of HOVILLE (P5864) encountered strong opposition, including extremely heavy artillery and mortar fires. Improved weather conditions facilitated observation and resulted in intensive observed fires upon targets of opportunity in support of our attack.

III Corps' attack continued against increasing enemy artillery opposition chiefly from Nebelwerfers and high velocity light caliber self-propelled and field guns. The enemy's fire was concentrated upon the forward elements of our advancing troops, especially against those of the 90th Infantry Division in the vicinity of HELE (P6552).

11 January. Following the fall of TILLAY (P4259) the enemy withdrew rapidly on the left flank of VIII Corps so that the initial objective of ST HUBERT (P5161), together with BATHYAL (P4959) and the high ground in the vicinity thereof, was secured. The enemy continued to harass our forces in the BASTOGNE (P5658) salient with both medium and heavy caliber weapons but hostile artillery fires in the remainder of the VIII Corps area were light.

Enemy artillery reaction to III Corps' attack continued to increase, especially against the forward elements of 90th Infantry Division, with fires frequently reaching the intensity of battalion concentrations. Large-scale enemy withdrawals from the pocket commenced so that III Corps artillery placed heavy harassing and interdiction fires on all escape routes.

Enemy artillery fires were moderate to light in the XII Corps area, the bulk of them being directed against the 80th and 5th Infantry Divisions on the left flank of the Corps and extensive use being made of Nebelwerfers. 80th Infantry Division occupied BOCKHOLZ (P7548). Artillery with XII Corps sent fire to BOLLENDORF (L0140) and then attached the town with time-on-target time fire concentrations to inflict heavy casualties upon the fire fighters.

12 January. Despite enemy withdrawals on the left flank of VIII Corps, extremely heavy fighting continued on the right flank. The 101st Airborne Division took FLAMIERGE (P4961) but the enemy continued to hold FLAMIERGE (P4761). An enemy tank attack against 11th Armored Division was smashed by combined air and artillery support.

Artillery with VIII Corps was reorganized to press the pursuit of the withdrawing enemy, as follows:-

Attached to 87th Infantry Division - one light artillery battalion.
General support, reinforcing 87th Infantry Division - one field artillery group consisting of two medium battalions.
Attached to 17th Airborne Division - one armored field artillery battalion.
Reinforcing 17th Airborne Division - organic artillery of 11th Armored Division.
General support, reinforcing 17th Airborne Division - one field artillery group consisting of two medium and one heavy battalion.
Attached to 101st Airborne Division - one armored field artillery battalion and two medium battalions.
General support - one field artillery group of two heavy artillery battalions.

III Corps' attack to close the pocket southeast of BASTOGNE (P5658) continued with the enemy artillery increasing the intensity of its fires on the leading elements but declining elsewhere. An estimated twenty-five battalions of enemy artillery were opposed to the Corps attack. Two battalions of light field artillery, one battery of medium artillery and one 4.2-inch chemical mortar platoon were coordinated to maintain a continuous smoke screen for one hour in the vicinity of HARDIN (P6056) while tanks of the 6th Armored Division moved to and occupied the high ground to the northwest. The successful completion of this maneuver resulted in quick capture of the town and the attack moved on to the vicinity of BRAS (P6255). The enemy pocket was substantially liquidated with heavy losses inflicted upon the enemy in both personnel and material.

Organic artillery of 26th Infantry Division attacked two batteries of enemy artillery with observed fires. All but one of the enemy guns were destroyed in their original positions. The one exception was able to withdraw from its position but was attacked and destroyed on the road. Heavy harassing and interdiction fire, particularly upon WILTZ (P7153) by III Corps artillery continued.

13 January. VIII Corps Artillery's harassing and interdiction fires against HOUFFALIZE and the HOUFFALIZE (P6171) - HOVILLE (P5864) road were intensified in view of the enemy withdrawal on the extreme left flank of the Corps.

The enemy attempted to bring twenty-five tanks south on the LONG-CHAMPS (P5365) - BASTOGNE (P5267) road to meet 11th Armored Division's advance north upon the axis of the road. The approaching enemy was engaged by a combination of air, artillery and tanks, six enemy tanks being destroyed and the remainder dispersed. In consequence, 11th Armored Division's attack advanced to the outskirts of BASTOGNE where house fighting developed.

Enemy artillery fires on the right flank of VIII Corps continued heavy despite displacement of the enemy's artillery to the rear by bounds. 101st Airborne Division was heavily shelled, particularly its infantry components, and the enemy also employed some counterbattery fire with occasional uses of time fire. The road leading northwest from BASTOGNE (P5658) was heavily attacked with observed enemy artillery fires that occasioned some damage. 101st Airborne Division Artillery and VIII Corps artillery in support thereof fired heavily in support of the Division which captured POIX (P5062) and stormed BOIS JACQUES (P5962) against heavy opposition.

A noteworthy example of effective air-ground coordination occurred in connection with an VIII Corps Artillery Arty/A mission. Upon completion of the mission the pilot was asked to verify a report of enemy armor moving south into HOUFFALIZE (P6171). The pilot located a mixed column of sixty vehicles, both armored and general purpose, moving into the town and adjusted on VIII Corps artillery battalion thereon. The adjustment was followed by a three-battalion time-on-target concentration upon the town. The pilot also vectored in a squadron of fighter bombers to bomb and strafe the enemy column. In the meantime he circled the area, locating two antiaircraft batteries that attacked our aircraft and adjusting two 155mm Gun battalions thereon. The destruction of the enemy column was virtually complete.

5th Infantry Division launched a limited objective attack in the vicinity of TETTINGEN (L0402) following an artillery preparation fired by the organic division artillery and two battalions of XX Corps artillery. Two XII Corps artillery battalions also participated in the preparation, firing for a ten-minute period upon the strongpoint towns of AIXE (L0504), HEMMG (L0403) and FREUDENLAND (L0906) and for twenty minutes upon enemy mortar locations. Artillery reaction to the 90th Division attack was light but there was some shelling of our artillery positions by enemy aircraft.

One 155mm Howitzer battalion was detached from VIII Corps and attached to XII Corps.

14 January. VIII Corps' direction of attack switched from the northeast to the east. Three enemy counterattacks were directed at FOY (P5702) with strong support from enemy self-propelled and direct-laying weapons. Artillery supporting 11th Armored Division fired heavily to assist in repelling these attacks and our position at FOY was successfully consolidated. Enemy harassing fires of the BASTOGNE (P5658) area continued and there was an increased volume of enemy shelling of our forward elements. 101st Airborne Division succeeded in taking HOVILLE (P5864) but a heavy enemy antitank reaction compelled a temporary withdrawal from the town despite the strong supporting fires of artillery with VIII Corps. 11th Armored Division successfully occupied BERTOGNE (P5267).

An VIII Corps 155mm Howitzer battalion attacked a concentration of eleven enemy tanks and effected the destruction of five thereof.

87th Infantry Division was detached from VIII Corps, attached to XII Corps and commenced its movement accordingly.

In the III Corps area, artillery with III Corps joined forces with the air support to attack heavily the enemy withdrawing from HAGARET (P4959) and the vicinity.

Artillery with XII Corps fired a small-scale coordinated program wherein the enemy was first attacked with artillery propaganda shells, then serenaded with a propaganda broadcast following which heavy artillery fires were placed in rear of the enemy forward elements to facilitate desertion.

5th Infantry Division's attack in the SAAR - MOSELLE triangle continued, again following a preparation fired by the Division Artillery and two battalions of XX Corps artillery with two battalions of XII Corps artillery also participating. The attack was successful in taking the towns of TETTINGEN (L0402) and BUTZDORF (L0405).

XX Corps Artillery employed roving guns extensively for long-range harassing and interdiction fires throughout the month. Positions close behind the forward elements, often with 300 yards thereof, were prepared surveyed in advance. Both 155mm Howitzers and 155mm Guns [illegible] occupying these positions briefly to fire upon towns [illegible]. The positions were then immediately [illegible] and were seldom used a [illegible] to attack all towns that could be [illegible].

Artillery ammunition expenditures [illegible] week ending at 140600 January declined from the preceding weeks totalling 249,284 rounds. The

DECLASSIFIED
DECLASSIFIED
Digitized by Google

decline is to be attributed in part to the less intensive fighting that followed the capture of THIONVILLE (P4500) and ST MIHIEL (P3511) and the elimination of the enemy pocket southwest of METZ/DIEDENHOFEN (P5606). The decline however had set in even prior to these events due to the fact that the amount of ammunition available necessitated conservation and close supervision of expenditures. The figures follow:-

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	-	25400	-	-
105mm Howitzer, M2	78663	54700	34980	12022
105mm Howitzer, M3	-	4736	-	-
4.5-inch Gun	1076	1677	1528	693
155mm Howitzer	20665	15393	13405	4504
155mm Gun	7675	5440	4459	1147
155mm Gun (SP)	-	1477	-	756
8-inch Howitzer	1904	88	1290	403
8-inch Gun	-	-	-	79
240mm Howitzer	-	-	558	237

15 January. Advances were general throughout the VIII Corps area as the enemy withdrew under cover of strong delaying forces. VIII Corps forward elements were approaching HOUFFALIZE (P6171) and occupied BOVIGNY (P6704) and CHAPLAIN (P7407). The enemy withdrawal was accompanied by a marked decline in its artillery fires.

Following a strong artillery preparation upon personnel, strongpoints, assembly areas, hostile artillery locations and the towns of OUBOURCY (P6111) and HOCHAMPS (P6106), 5th Armored Division attacked to secure BASTOGNE-CAMPS (P6557) and the high ground to the northeast. An air strike upon LOMBYVILLE (P6406) was followed by heavy harassing and interdiction fires by III Corps artillery throughout the night upon all routes leading into the town. 6th Armored Division attacked and secured the town the following morning.

Heavy and confused fighting prevailed in the southeast corner of the SAAR - MOSELLE triangle where 94th Infantry Division attacked following an artillery preparation to secure the towns of HERMIS (L0604), BORG (L0600) and WIES (L1005). Enemy counterattacks against TETTINGEN (L0403) and BUTZDORF (L0405) were repulsed with strong supporting artillery fires. Enemy artillery activity in this area showed a gradual steady increase.

16 January. VIII Corps advanced rapidly in pursuit of the withdrawing army on its left flank and established contact with VII Corps in the vicinity of HOUFFALIZE (P6171) though the town did not fall until the next day. All available artillery placed heavy harassing and interdiction fires on the few escape routes still available to the enemy leading east from HOUFFALIZE (P6171).

Determined enemy resistance was encountered on the right flank of VIII Corps in the vicinity of BOURCY (P6404), the enemy defense of the town being strongly supported with the fires of both field artillery and self-propelled weapons.

Sharp enemy counterattacks against the 90th Infantry Division were repelled and heavy casualties inflicted by the massed artillery fires of 90th and 94th Infantry Divisions. Thereafter 90th Infantry Division Artillery massed its fires in time-on-target concentrations on the town of NIEDERWAMPACH (P4406) following which the infantry took the town at a cost of two casualties as against 300 prisoners taken. Enemy artillery opposed to III Corps continued to decline sharply both in volume of fires received and in locations reported and there was every evidence that displacement of enemy artillery to the northeast was continuing.

One combat command of 10th Armored Division, including one organic artillery battalion, that had been operational under VIII Corps in the BASTOGNE (P5668) area was detached and moved to rejoin the Division in the vicinity of METZ (U85).

17 January. 101st Airborne Division on the right flank of VIII Corps attacked following a strong artillery preparation on enemy artillery locations, enemy strongpoints and the town of BOURCY (P6403). Enemy artillery reaction to the attack was severe but the town was seized and secured against relatively light ground resistance.

VIII Corps' objective having been taken, the Corps reorganized while defending upon a line HOUFFALIZE (P6171) - HARDIGNY (P6804) - BOURCY (P6404) with a plan of artillery defensive fires prepared accordingly. 17th Airborne Division relieved elements of the 11th Armored Division and the 101st Airborne Division in the line and the latter assembled in Corps reserve.

A heavy harassing and interdiction program was conducted on this date and subsequently upon all escape routes available to the enemy out of the ARDENNES area. This program was fired by all available artillery of VIII, III and XII Corps and in addition the artillery of First U.S. Army participated heavily within its zone. First U.S. Army was requested to place maximum harassing and interdiction fires within the Third U.S. Army area east of the 75-grid line and north of the 70-grid line, this area being beyond the maximum range of any weapons with Third U.S. Army. The lateral limit of this area was subsequently moved east as our advancing troops forced acceleration of the enemy withdrawal and enabled artillery with Third U.S. Army to displace forward.

A major counterattack developed against 90th Infantry Division with all available artillery with III Corps firing in defense. An estimated twelve tanks were destroyed and 500 enemy troops killed or wounded.

XII Corps attacked to the north at 0330 to clear the enemy west of the SIEGFRIED LINE within the Corps area, 4th, 5th and 80th Infantry Divisions being employed in the assault. To preserve the surprise element of the attack, no artillery preparation was fired. However all artillery with the Corps participated in an intensive four-hour schedule of preprranged fires commencing at H hour. In addition to all enemy artillery locations the schedule embraced fourteen command posts, two observation posts, six supply dumps, twenty-four defiles, twenty-one towns and nine heavy weapons locations. Artillery supporting 80th Infantry Division on the west flank of XII Corps participated heavily throughout the schedule of preprranged fires so as to screen the direction of the main effort. Initial enemy artillery reaction to the attack was light but intensified on the succeeding day, particularly against the bridgeheads of the 4th and 5th Infantry Divisions across the SAUER RIVER.

Artillery with XII Corps fired strongly in support of the attack, the missions consisting of both on call fire upon targets of opportunity and preprranged missions in the nature of localized preparation fires. The scale of the artillery support is best illustrated by the ammunition expenditures of the artillery with the Corps which totalled 5,835 rounds on the day preceding the attack, 13,716 rounds on the day of the attack and 22,041 rounds on the succeeding day.

18 January. 28th Infantry Division was relieved from VIII Corps and [illegible] Army. 10th Armored Division, re-fitting in the vicinity of METZ (U85), was relieved from XX Corps and Third U.S. Army.

One armored field artillery battalion, one 8-inch Howitzer battalion and one 4.5-inch Gun battalion all of which had suffered heavy losses during the enemy penetration and which had been re-fitting under the supervision of VIII Corps, were re-committed to the VIII Corps front. The 4.5-inch Gun battalion was temporarily equipped with 155mm Howitzers due to a current shortage of 4.5-inch Guns in the Theater.

35th Infantry Division, less certain elements, was detached from III Corps and attached to XX Corps, moving to METZ (U85) for rest and maintenance. One organic light artillery battalion of 35th Infantry Division was temporarily attached to and fired in support of 6th Armored Division.

Both 6th Armored and 90th Infantry Divisions launched local attacks following brief but intensive artillery preparations fired by the organic division artillery and III Corps artillery in support thereof. Artillery with III Corps fired heavily upon harassing and interdiction missions on all road junctions, bridges and other critical points on the enemy's escape routes and also conducted an intensive counterbattery program.

Heavy localized fighting persisted in the southwestern corner of the SAAR - MOSELLE triangle where 94th Infantry Division, on the left flank of XX Corps, and the enemy continued to contest the towns of TETTINGEN (L0404), BUTZDORF (L0405), HERMIS (L0604), BORG (L0600) and WIES (L1005). Artillery fires in support of 94th Infantry Division were strong, as is indicated by ammunition expenditures of artillery with XX Corps which totalled 12,470 rounds on 18 January as against only 2,966 rounds on the preceding day. The enemy artillery was also very active, firing an estimated 500 rounds in support of an enemy counterattack at TETTINGEN alone.

19 January. The attack in the XII Corps sector drove gradually forward with heavy artillery support. One 240mm Howitzer battalion fired no less than thirty-four missions in close support of 5th Infantry Division.

20 January. Enemy artillery fires were light throughout the ARDENNES area as the withdrawal continued in the face of VIII and III Corps' close pursuit and as XII Corps drove steadily forward.

101st Airborne Division was relieved from III Corps and Third U.S. Army.

After a full month of relative quiescence enemy artillery in the XX Corps area erupted with a violent schedule of early morning artillery fires into the SAARLAUTERN (G2879) bridgehead. These fires were in the nature of an artillery preparation and were accompanied by long-range heavy caliber fires in our rear areas notably at BOULONVILLE (Q1377) and RICHEMONT (Q1168). XX Corps artillery responded with an intensive schedule of twenty-three counterbattery missions, largely observed, following which the enemy artillery relapsed into its accustomed state of quiet. No enemy attack developed.

Long-range medium caliber enemy projectiles of a new type fell in and around the city of LUXEMBOURG (P81). This was the eighth time since 31 December that this area which included the Army Forward Command Post had been attacked with the harassing fires of this weapon, approximately 150 rounds being expended in all with relatively small material and personnel damage.

In retaliation for the shelling of LUXEMBOURG (P81), XII Corps artillery employed a 155mm Gun well forward in the Corps area to attack the city of TRIER (L2109). This gun delivered an estimated eight rounds upon TRIER for every round falling in and around the city of LUXEMBOURG.

21 January. Both VIII and III Corps were attacking, the former in its zone on the left flank of the Army and the latter with the objective of seizing the high ground southeast of ST VITH (P9588). Artillery with both Corps displaced frequently in the support of the pursuit.

Enemy artillery activity continued in the XX Corps area and strongly supported a night counterattack against the 94th Infantry Division in the vicinity of HERMIS (L0604) and TETTINGEN (L0404). The organic divisional artillery and two battalions of XX Corps artillery fired extensive defensive fires. 95th Infantry Division launched a limited objective attack in the XX Corps bridgehead area at SAARLAUTERN (G2827) supported by a preparation fired by XX Corps artillery upon enemy artillery locations. The objectives were quickly attained.

Artillery ammunition expenditures for the week ending 210600 January remained approximately the same level as the preceding week. The period was marked however by a striking increase of artillery fires in the XX Corps area in consequence of the heavy fighting in the SAAR-MOSELLE triangle and by somewhat of a decrease in the ARDENNES area in view of the enemy's withdrawal. The figures are as follows:-

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	9043	-	-	-
105mm Howitzer, M2	16754	62218	53551	33249
105mm Howitzer, M3	870	-	-	-
4.5-inch Gun	1343	1527	2126	57
155mm Howitzer	5015	16062	25400	10579
155mm Gun	2098	5722	6485	1564
155mm Gun (SP)	1220	-	-	845
8-inch Howitzer	659	1321	2068	759
8-inch Gun	-	-	345	176
240mm Howitzer	-	-	989	160

22 January. The rapid pursuit of III and VIII Corps and the relentless pressure of XII Corps' attack intensified the pace of the enemy's withdrawal from the ARDENNES bulge to the point that it became a rout. Artillery Air OP pilots and Arty/R and Tac/R pilots all reported heavy enemy vehicular concentrations jammed up in the vicinity of the few available crossings of the OUR RIVER, notably at ESCHDORF (P8657) and DIEKIRCH (P8755). These concentrations of transport were immediately and persistently attacked throughout the day by all available aircraft of the XIX Tactical Air Command as well as by all available artillery with the Army. The carnage resulted in the estimated destruction of in excess of 1,800 enemy vehicles of all types.

XII Corps' attack continued with heavy artillery support. A 45-minute artillery preparation was fired by ten battalions of XII Corps artillery in addition to the organic artillery of the 4th, 5th and 80th Infantry Divisions.

Artillery with XII Corps was organized in support of the attack as follows:-

General support, reinforcing 80th Infantry Division - one field artillery group consisting of two light, one medium and one heavy battalion.
General support, reinforcing 4th Infantry Division with one medium battalion and 5th Infantry Division with one light and two medium battalions - one field artillery group consisting of one light and three medium battalions.
Corps fire direction center in western portion of Corps zone - one field artillery group with two heavy artillery battalions attached and one field artillery observation battalion in support.
Corps fire direction center in eastern portion of Corps zone - Headquarters and Headquarters Battery, XII Corps Artillery with one heavy battalion and one 8-inch Gun battery attached and one field artillery observation battalion in support.

Digitized by Google

Heavy fighting continued in the SAAR - MOSELLE triangle with 94th Infantry Division attacking in the vicinity of NEUNIG (L0624) with extensive support from its organic artillery and two battalions of XX Corps artillery. The latter fired 360 rounds into an enemy occupied antitank ditch which was thereafter overrun by our troops who found forty enemy dead and took six prisoners of war.

23 January. Enemy traffic at the various crossings of the OUR RIVER was again heavy, particularly at EISENBACH (P8657) and the attack thereof by both artillery and air was resumed with excellent results.

5th Infantry Division experienced several pre-dawn counterattacks in the vicinity of NACHTMANDERSCHEID (P9451) all of which were repulsed with the assistance of strong supporting fires from the organic artillery.

24 January. The withdrawing enemy made a temporary stand in the XII Corps area at WASSERBILLIG (L1124) so that heavy house-to-house fighting developed before 87th Infantry Division succeeded in taking the town. Enemy artillery activity in this area was generally light. Two heavy artillery battalions with XII Corps attacked a concentration of enemy tanks on the road and destroyed twelve.

An analysis of the enemy's employment of heavy caliber long-range guns against XX Corps revealed that two or three weapons of different calibers firing from different positions were habitually employed to attack the one target in an effort to confuse our counterbattery agencies. 240mm, 280mm and 380mm weapons had all been repeatedly employed against BOULONVILLE (Q1377). Eighty-two rounds, the equivalent of some fifty-two tons, had fallen in this area.

26 January. Pursuit of the fleeing enemy continued and his delaying forces having been driven in, patrols of both III and VIII Corps reached the OUR RIVER. The planned reorganization of the Army to continue the attack to the east was instituted forthwith. On this and immediately succeeding days 87th and 4th Infantry Divisions were detached from XII Corps and attached to VIII Corps, 76th Infantry Division detached from VIII Corps and attached to XII Corps, 95th Infantry Division detached from XX Corps and attached to VIII Corps, 17th Airborne Division detached from VIII Corps and attached to III Corps, 26th Infantry Division detached from III Corps and attached to XX Corps and 90th Infantry Division detached from III Corps and attached to VIII Corps. The net result of these changes was to weight VIII Corps on the left flank of the Army with five divisions, leaving XII Corps with four divisions and III and XX Corps with two divisions apiece. Artillery with the Army was reorganized in comparable fashion, one medium and one heavy artillery battalion being detached from III Corps and two medium and one heavy artillery battalion being detached from XII Corps, all being attached to VIII Corps. In consequence of the re-grouping, artillery with Third U.S. Army was now organized in the following proportions:-

Attached to VIII Corps - four artillery groups, three light artillery battalions, seven medium artillery battalions and six heavy artillery battalions.
Attached to III Corps - three field artillery groups, two light battalions, five medium battalions and two heavy battalions.
Attached to XII Corps - four field artillery groups, four light battalions, four medium battalions, three heavy battalions and one 8-inch Gun battery.
Attached to XX Corps - three field artillery groups, three light battalions, three medium battalions, four heavy battalions and one 8-inch Gun battalion less one battery.

An artillery observer detected a large enemy troop and vehicle concentration in the process of withdrawing from WEISWAMPACH (P8172). The town was immediately attacked with the massed fires of a six-battalion time-on-target concentration employing quick, delay and time fuzes in equal proportions. Elements of 6th Armored Division advanced to the perimeter of the artillery fire which was then lifted and the town taken against shattered opposition.

27 January. One headquarters and headquarters battery, field artillery group was detached from XX Corps and Third U.S. Army.

Only light resistance was encountered throughout the ARDENNES area and artillery opposition continued to decline. Artillery with VIII Corps participated in the preparation fires for an attack to the south by XVIII Airborne Corps, attached to First U.S. Army.

Air OP Bulletin Number 6, Annex 16, copy attached, was published.

28 January. The enemy had resisted most strongly upon the shoulders of the ARDENNES salient to cover his withdrawal in the center. Consequently, artillery ammunition expenditures for the week ending at 280600 reflect light firing in VIII Corps on the north flank of the Army that gradually intensified to heavy firing on the south flank of the ARDENNES area. The figures follow:-

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	-	3004	-	-
105mm Howitzer, M2	32220	7982	66999	31125
4.5-inch Gun	2219	513	1687	-
155mm Howitzer	11407	4052	22102	10451
155mm Gun	4349	3453	5512	1148
155mm Gun (SP)	-	1746	-	3089
8-inch Howitzer	623	419	2407	841
8-inch Gun	-	-	295	309
240mm howitzer	-	-	71	26

29 January. There was an increase in enemy artillery activity in the VIII Corps area with some harassing fires being received in the vicinity of ST VITH (P9696) and strong artillery opposition to our crossings of the OUR RIVER at STURBACH (P8676) and WEISWEILERHAUSEN (P8674). Artillery with VIII Corps fired extensively both on harassing and interdiction and on counterbattery missions. Artillery activity, both friendly and enemy, throughout the remainder of Third U.S. Army area was light.

26th Infantry Division, which had been relieved from III Corps, was attached to XX Corps and went into position in the vicinity of the SAARLAUTERN (Q2879) bridgehead.

30 January. 17th Airborne Division Artillery displaced and occupied positions 3,500 yards east of the OUR RIVER.

A small scale enemy counterattack against the 90th Infantry Division was dispersed by the artillery fire of the organic division artillery before it could reach our forward positions. A battery of enemy artillery harassed bridging operations in the 90th Division area but it was silenced by a five-battalion time-on-target concentration fired by VIII Corps artillery.

Throughout the period. The first part of the month was marked by extremely heavy fighting throughout the western ARDENNES as VIII Corps drove back the point of the enemy penetration and III Corps smashed the desperately held enemy pocket southeast of BASTOGNE (P5656). In all, sixty-nine divisional and non-divisional artillery battalions, later increasing to seventy-seven, supported Third U.S. Army's offensives in the ARDENNES. The bulk of this artillery was capable of, and did in fact, fire strongly in support of the offensives in the vicinity of BASTOGNE. The volume of artillery support in this area was the highest in the operational history of the Army to date, particularly in the week ending at 070600 January when artillery with the Army fired 401,393 rounds in the ARDENNES. The volume of artillery support was less heavy in the following week, 249,284 rounds being expended in this area, due in part to the enforced deterioration of the enemy resistance in the western ARDENNES and in part to limited ammunition availability.

The latter part of the month was characterized by heavy fighting in the eastern ARDENNES as XII Corps gradually drove back a determined enemy fighting strongly to cover his withdrawal further to the north. Artillery support in this area was strong and constant. III Corps and VIII Corps were in rapid pursuit of the fleeing enemy with their artillery advancing by bounds in close support. Artillery fires here were largely harassing and interdictory on the enemy's escape routes with occasional periods of heavy firing in support of localized actions to drive in the enemy's delaying forces.

At the end of the period Third U.S. Army, and all artillery therewith, had completed re-grouping and was again approaching the main defenses of the SIEGFRIED LINE along its entire front. The smashing of the December counteroffensive had been completed.

CHAPTER 9
FEBRUARY OPERATIONS

2 February. Enemy artillery was moderately active against VIII Corps, notably against 4th and 90th Infantry Divisions. Strong enemy resistance, employing coordinated small arms, mortar and artillery fires, was encountered by 4th Infantry Division on the high ground south of HADSCHEID (P9786) and west of BLEIALF (P9683). Following a sharp fire fight the enemy was driven back into BLEIALF and was there repeatedly attacked with massed time-on-target artillery concentration. VIII Corps Artillery also made extensive use of 155mm Guns and 240mm Howitzers for long-range harassing fire upon traffic bottle necks and enemy troop and supply installations in the vicinity of PRUM (L0679).

VIII Corps experienced only light enemy harassing fires upon its forward elements, these fires coming largely from 12cm mortars and from single guns emplaced in the high ground east of the OUR RIVER. Artillery with III Corps was organized for combat as follows:-

General support, reinforcing 6th Armored Division - one field artillery group consisting of two armored field artillery battalions and one 155mm Howitzer battalion.
General support, reinforcing 17th Airborne Division and 6th Cavalry Group - one field artillery group consisting of three 155mm Howitzer battalions.
General support - one field artillery group consisting of one 4.5-inch Gun battalion and two 155mm Gun battalions.

To enhance and assure the accuracy of massed artillery fires, XII Corps required that group and division artillery commanders utilize all periods of relative inactivity periodically to check for both timing and accuracy. Such check fires were to be directed against enemy-occupied towns, thereby tying into the Corps harassing and interdiction program. Full report of results to the Corps Artillery Commander was required. Comparable measures were adopted by the remaining corps with the Army.

Artillery with XX Corps attacked a concentration of twelve enemy tanks east of KREUZWEILER (L0306) with a seven-battalion time-on-target concentration, destroying three and dispersing the remainder. Both VIII and XX Corps employed 8-inch Howitzers extensively for the attack of pillboxes with excellent results, effective penetrations being obtained.

3 February. VIII Corps encountered moderate resistance on its north flank as it continued the process of clearing the SIEGFRIED LINE and took the towns of LOSCHEIN (L0396), KREMINKEL (L0493) and ROTH (L0491). 4th Infantry Division, supported with repeated time-on-target concentrations fired by the Division Artillery, cleared BLEIALF (P9683) and continued its advance against weakened opposition.

One field artillery group, one field artillery observation battery, two 155mm Howitzer battalions and one 155mm Gun battalion were detached from VIII Corps and from Third U.S. Army.

The enemy instituted a moderate to heavy harassing and interdiction program against III Corps with particular emphasis upon the main north - south highway on the high ground west of the OUR RIVER as well as towns and observation facilities in the vicinity of HOSINGEN (P8258).

III Corps artillery continued its accustomed program of strong scale harassing and interdiction fires placed upon all enemy-held towns and buildings within range of the artillery with the Corps. XX Corps artillery continued to utilize 155mm Howitzers as roving guns firing from positions far forward in order to harass and interdict the enemy's extreme rear areas.

4 February. 4th Infantry Division in the VIII Corps area breached the initial SIEGFRIED LINE defences on the southern end of the SCHNEE EIFEL ridge in the vicinity of BRANDSCHEID (P9881) following an early morning surprise attack without prior artillery preparation. The defending enemy infantry was largely supported by tanks and self-propelled guns but had little artillery support. VIII Corps artillery rendered close support for the attack with emphasis upon neutralization of enemy observation posts and harassing fires upon possible enemy reserves in draws and towns in the immediate vicinity.

XII Corps was engaged in planning for its offensive to secure crossings of the SAUER RIVER and attack to the north. Artillery with the Corps was organized for support of the attack as follows:-

General support, reinforcing 80th Infantry Division with two light battalions and one medium battalion - one field artillery group consisting of two light and two medium battalions.

General support, reinforcing 5th Infantry Division with two medium battalions - one field artillery group consisting of two medium battalions and one heavy battalion. (One light battalion of the 76th Infantry Division was also given a mission of reinforcing the 5th Infantry Division.)
General support, reinforcing 2d Cavalry Group with one light and one medium battalion - one field artillery group consisting of one light, one medium and one heavy battalion and one 8-inch Gun battery.

Ammunition expenditures for the week ending at 040600 February reflected the stern fighting as VIII Corps entered and commenced to clear the SIEGFRIED LINE defenses, the occasionally sharp but essentially localized fighting in the SAAR - MOSELLE triangle and the SAARLAUTERN (Q2879) bridgehead in the XX Corps zone, and the generally light fighting throughout the remainder of the Army area. The figures are as fol-

DECLASSIFIED

Digitized by Google

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	7093	-	-	-
105mm Howitzer, M2	3444	28013	14502	27299
4.5-inch Gun	1137	2344	1421	-
155mm Howitzer	6407	12177	3499	7880
155mm Gun	803	3188	1247	1075
155mm Gun (SP)	-	1426	-	1725
8-inch Howitzer	-	2865	474	800
8-inch Gun	-	-	222	223
240mm Howitzer	-	229	-	193

5 February. 95th Infantry Division and its organic artillery, in XIII Corps reserve, was relieved from VIII Corps and from Third U.S. Army.

VIII Corps, having accomplished its initial objective with the capture of BRANDSCHEID (P9981), reorganised for continuation of the attack to complete penetration of the SIEGFRIED LINE defenses and to secure PRUM (L0679) and PRUMFELD (L0074). Artillery with the Corps was organised to continue support as follows:-

Attached to 87th Infantry Division - one light battalion.
General support, reinforcing 87th Infantry Division - one field artillery group consisting of two medium battalions.
Attached to 4th Infantry Division - one light battalion, one medium battalion and one battery, 155mm Gun (SP).
General support, reinforcing 4th Infantry Division with one medium battalion - one field artillery group consisting of two medium battalions and one heavy battalion.
Attached to 90th Infantry Division - one armored field artillery battalion, one medium battalion and one battery, 155mm Gun (SP).
General support, reinforcing 90th Infantry Division with one medium battalion - one field artillery group consisting of one medium battalion and two heavy battalions. (One 8-inch Howitzer battery to be available to 90th Infantry Division for direct support missions.)
General support - one field artillery group consisting of three heavy battalions. (One 8-inch Howitzer battery thereof to be available to 4th Infantry Division for direct support missions.)

Both enemy and friendly artillery fires were light in the III and XII Corps zones, due in part to the passive enemy and in part to rain and ground fog that restricted observation to 200 yards or less. Much of the artillery with XII Corps was displacing to new positions whence to support the forthcoming attack.

One 155mm Gun (SP) battery was detached from XX Corps and attached to XII Corps.

A forward observer in the XX Corps zone located enemy machine guns firing from positions within a house and made a precision adjustment thereon with 105mm Howitzers. The adjusted coordinates were then transmitted to an 8-inch Howitzer battalion whose first round obtained a direct hit and demolished the house. This technique was frequently utilised in an effort to conserve 8-inch Howitzer ammunition.

6 February. An estimated ten battalions of light artillery and four battalions of medium artillery were opposed to VIII Corps. Enemy fires were generally moderate with extremely heavy rocket fires late in the period in the vicinity of HELENENFELD (P9985) and BRANDSCHEID (P9981).

4th Infantry Division's attack to expand its hold on the SCHNEE EIFEL ridge continued. A sharp counterattack was repulsed with the heavy fires of supporting divisional and VIII Corps artillery and HASCHEID (P9577) was taken. Enemy artillery heavily shelled the town in prompt reaction to its capture.

90th Infantry Division attacked following a brief but intensive artillery preparation fired by three battalions of XX Corps artillery and by 90th Infantry Division Artillery. Enemy artillery reacted only lightly to the attack and the objective, the town of SIRK (L0504), was quickly taken.

7 February. XII Corps launched a coordinated attack to secure crossings of the SAUER RIVER. A heavy artillery preparation, involving an expenditure of approximately 29,000 rounds of ammunition, was fired from 0130 to 0600 by all Corps and division artillery battalions and in addition by three battalions of III Corps artillery. The preparation embraced 280 missions on enemy artillery locations, 137 on enemy command posts and 102 on enemy-occupied towns. Upon conclusion of the preparation fires the divisional artillery reverted to close support of the respective divisions and the Corps artillery fired a program of heavy harassing and interdiction fires on towns and enemy command posts until 1200 hours. Enemy artillery activity increased considerably in reaction to the attack with emphasis upon harassing and interdiction fires in the bridgehead areas, particularly against the 80th Infantry Division. XII Corps artillery fired a heavy program of counterbattery fires including a total of forty-eight Serenade missions throughout the period.

Three moderate-scale tank and infantry counterattacks were launched by the enemy in the late afternoon and night against the 5th Infantry Division in the area north and northeast of ECHTERNACH (L0535). All were broken up and repulsed with the assistance of the massed fires of the 5th Infantry Division Artillery.

Artillery forward observers located a large-scale enemy counterattack forming against VIII Corps in the vicinity of (L0518??). An eight-battalion time-on-target was placed upon and dispersed the enemy formation.

8 February. The enemy, resisting strongly against VIII Corps' penetration into the SIEGFRIED LINE, was compelled to yield gradually before the heavy and increasing pressure. The enemy defense was supported by moderate to heavy artillery fires, particularly emphasising direct fire upon our forward elements and including extensive harassing fires in the rear areas with heavy concentrations upon several towns. A strong counterattack of battalion strength that sought to retake HASCHEID (P957?) was repulsed after prolonged fighting in which artillery with VIII Corps participated heavily. The advance of the 4th Infantry Division continued with strong artillery support and developed into a serious threat to PRUM (L0679).

XII Corps' attack continued with strong local preparations being repeatedly fired in support of division attacks. Heavy machine gun and small arms fires were encountered at the river crossing sites with moderate enemy artillery support. The bulk of the enemy artillery apparently had displaced to alternate positions following the initial Corps artillery preparation. Location of the new positions was considerably hampered by adverse weather conditions resulting in poor visibility, lack of photo cover and difficulty in sound ranging. Silent periods to facilitate sound ranging were imposed upon our own artillery fires in consequence of which considerable success was achieved in locating the enemy artillery. Artillery liaison planes flew forty-one missions to supply 5th Infantry Division units temporarily isolated on the north bank of the SAUER RIVER.

9 February. Artillery with VIII Corps fired strongly in close support to assist in repelling repeated enemy counterattacks against the 4th Infantry Division, particularly in the vicinity of HINDENBURGLEN (L0480). Enemy artillery fires were generally light but the counterattacks were strongly supported by heavy mortars.

Both 6th Armored and 17th Airborne Divisions succeeded in establishing bridgeheads over the OUR RIVER in the III Corps zone. The 6th Armored Division crossing was facilitated by a one-hour artillery smoke screen covering the assault troops after they had been pinned down by heavy small arms and machine gun fire. III Corps Artillery initiated extensive harassing and interdiction fire upon all crossroads and avenues of approach east of the OUR RIVER.

Artillery with XII Corps continued to fire heavily in support of the Corps attack and repeatedly fired brief but intensive preparations in support of division attacks. Enemy artillery reaction to the attack continued to increase and included considerable heavy mortar and Nebelwerfer fires, notably against the bridge sites of the 80th Infantry Division in the vicinity of HORSDORF (P9643) and WALLENDORF (P9642). Artillery with XII Corps continued its program of extensive harassing and interdiction fires upon all enemy-held towns and buildings up to the extreme range of the artillery with the Corps.

Twenty-five British 25-pounder (3.45-inch) field gun-howitzers were issued on a loan basis to XII and XX Corps.

10 February. Two companies of enemy infantry, supported by an estimated fifteen tanks, were observed assembling west of PRUM (L0679) preparatory to a counterattack against the 4th Infantry Division. The concentration was attacked by a five-battalion time-on-target concentration following which fire was adjusted by observed methods and the area repeatedly swept with bracket fire methods. An estimated fifty per cent casualties were inflicted upon the enemy and eight tanks were destroyed.

155mm Guns (SP) were used extensively in close support of the infantry to reduce and destroy the many enemy pillboxes. In VIII Corps one battery each of these guns had for some time been attached to 4th and 90th Infantry Divisions respectively. XII Corps had attached one battery to the 90th Infantry Division and one platoon each to the 5th and 76th Infantry Divisions. The weapon proved eminently satisfactory for the purpose and one XII Corps battery effected the destruction of nine pillboxes on this date alone.

III Corps, together with Headquarters and Headquarters Battery, III Corps Artillery, and 17th Airborne Division and the organic artillery thereof were relieved from Third U.S. Army.

6th Armored Division and 6th Cavalry Group were detached from III Corps' 4th attached to VIII Corps as were one field artillery observation battalion, three field artillery groups, one light, five medium and two heavy artillery battalions.

Enemy fires were light throughout XII Corps zone except for extremely heavy fires upon the 5th Infantry Division bridge site. Four battalions of XII Corps artillery in addition to one battalion of the 5th Infantry Division fired a thirty-minute "on call" preparation embracing fifteen missions upon enemy-held towns and strongpoints and five missions upon enemy artillery locations.

11 February. Artillery with VIII Corps was reorganised for the support of the Corps as follows:-

General support - Headquarters and Headquarters Battery, VIII Corps Artillery with two observation battalions attached and one field artillery group functioning as an auxiliary fire direction center.
General support, reinforcing 87th Infantry Division - one field artillery group consisting of one light, one medium and two heavy battalions.
General support, reinforcing 4th Infantry Division - one field artillery group consisting of one light, two medium and one heavy battalion.
General support, reinforcing 90th Infantry and 11th Armored Divisions with one medium battalion each - one field artillery group consisting of two medium and two heavy battalions.
General support, reinforcing 6th Armored Division with one medium battalion - one field artillery group consisting of two medium and two heavy battalions.
General support, reinforcing 6th Armored Division with one medium battalion and 6th Cavalry Group with one light and two medium battalions - one field artillery group consisting of one light and three medium battalions.

The enemy launched night counterattacks against 4th Infantry Division at KLEINLANGENFELD (L1086) and WILWERATH (L0984) in an attempt to reduce VIII Corps' bridgehead over the PRUM RIVER. Both counterattacks were repulsed with the assistance of the defensive fires of artillery supporting 4th Infantry Division and toward the close of the period the enemy had largely withdrawn from PRUM (L0679).

HEINSFELD (L0277) and HATZERATH (L0177) were both heavily attacked with the massed fires of artillery supporting 90th Infantry Division. Enemy activity in the towns ceased in consequence thereof and both were taken against demoralised opposition.

Fifteen rounds of 30cm shell fell in the VIII Corps area in the vicinity of (P9929&2) from a weapon believed to be firing from the general vicinity of JUNKERATH (L1894). This was the first instance of the enemy's use of a weapon heavier than 15cm in caliber since the cessation of the action at BASTOGNE (P5658).

Artillery ammunition expenditures for the seven-day period ending at 110600 February reflected the very heavy fighting that followed XII Corps' attack across the SAUER RIVER and the increasingly heavy fighting as VIII Corps penetrated ever more deeply into the SIEGFRIED LINE defenses. The expenditures are as follows:-

	III Corps	VIII Corps	XII Corps	XX Corps
75mm Howitzer	9517	-	-	-
105mm Howitzer	8405	63480	86716	37434
4.5-inch Gun	760	2257	3557	-
155mm Howitzer	9559	17227	25069	11001
155mm Gun	1814	3484	7166	1568
155mm Gun (SP)	-	971	789	650
8-inch Howitzer	-	3325	3047	713
8-inch Gun	-	-	286	34
240mm Howitzer	-	193	-	72

12 February. VIII Corps occupied PRUM (L0679) with no resistance other than from small enemy pockets and snipers within the town. Heavy mortar and artillery fires were received within the town but enemy fires were light throughout the balance of the Corps zone.

Operations throughout the Army zone and particularly in the VIII Corps area were seriously hampered by the prolonged thaw and the resultant impassable conditions even on primary roads. One 4.5-inch Gun battalion was utilised to assist engineers of VIII Corps with road maintenance and repair.

13 February. A strong counterattack against 80th Infantry Division, attached to XII Corps, was repelled by the defensive fires of artillery supporting the Division assisted by the heavy fire of four

Digitized by Google

VIII Corps artillery battalions upon the towns of HOMPERICH (P9448) and GRENDERICH (P9349).

Enemy artillery fires opposed to XII Corps continued to decrease. Favorable weather and good observation conditions enabled XII Corps artillery to fire extensively upon targets of opportunity. Artillery with the Corps fired a total of sixty-four counterbattery missions during the period of which thirty-eight were observed and the remaining twenty-six were fired during darkness and consequently were unobserved.

Enemy fires in the XX Corps zone were light and showed an unaccustomed tendency to concentrate almost entirely upon our ground observation posts. Large numbers of enemy troops were observed moving into DERLEN (Q5477), following which the town was heavily and repeatedly attacked by 26th Infantry Division Artillery and three battalions of supporting XX Corps artillery.

14 February. 10th Armored Division, in Supreme Headquarters Allied Expeditionary Force reserve in the vicinity of METZ (U85), was attached to Third U.S. Army and to XX Corps.

Activity throughout the XX Corps area to date had been generally static. Enemy artillery fires had been extremely light consisting for the most part of harassing fires upon our forward elements with occasional concentrations directed at our observation posts. XX Corps artillery had fired brief but intensive missions in support of occasional local objective attacks in the SAARLAUTERN (Q2879) bridgehead and in support of the 94th Infantry Division in the SAAR - MOSELLE triangle. An estimated twelve to fourteen battalions of enemy artillery were opposed to XX Corps spread more or less evenly over the entire Corps front.

The enemy's increasingly acute shortage of manpower was repeatedly manifested as enemy artillerymen fighting in an infantry role were captured in ever larger numbers.

15 February. VIII Corps experienced moderate enemy artillery fires, the strongest being in the zone of the 87th Infantry Division where both medium and heavy caliber fires were received. Artillery with VIII Corps fired a total of fifty-five counterbattery missions during the period. 6th Armored Division Artillery was employing eighteen 105mm assault guns and found them to be generally effective weapons against all types of artillery targets.

An estimated twelve battalions of enemy artillery were opposed to XII Corps, the fires of which were concentrated generally upon our forward elements and bridge sites with extremely little harassing of our rear areas. The bulk of the enemy's firing generally occurred at dusk when poor visibility tended to hamper retaliatory counterbattery fires.

94th Infantry Division Artillery and two battalions of XX Corps artillery fired a 5,000-round preparation for a limited objective attack in the SAAR - MOSELLE triangle. Enemy artillery reaction was modest.

16 February. VIII Corps resumed its attack to clear the enemy west of the PRUM RIVER and to effect a junction with XII Corps in the vicinity of HAUBL (U0464). Artillery organization in support of the attack remained substantially unchanged. The artillery fired strongly in close support of the attack as well as many missions of a counterbattery or harassing and interdiction nature.

An Arty/R pilot on a mission for VIII Corps Artillery located twelve enemy tanks in the vicinity of HOUSHEIDEL (P9259). A 155mm Gun battalion was adjusted and upon completion of the adjustment a 155mm Howitzer battalion and a second 155mm Gun battalion joined in the fire for effect, a total of eleven battalion volleys being fired. Excellent effect was reported by the pilot.

17 February. Interrogation of a Prisoner of War elicited advance information of a strong enemy counterattack directed at PRUM (U0679) to be preceded by a coordinated preparation of small arms, mortar and artillery fire commencing at 1000 hours. Artillery with VIII Corps accordingly fired a heavy harassing program upon all known enemy artillery locations commencing at 0955 and continuing to 1015. Heavy enemy small arms and mortar fires commenced promptly at 1000 hours but no enemy artillery fire was received and no enemy counterattack was forthcoming.

XII Corps modified its artillery organization so as to utilize one field artillery group as the Corps fire direction center in the western portion of the Corps zone while Headquarters and Headquarters Battery, XII Corps Artillery continued to operate in this capacity in the eastern portion of the Corps zone. Enemy artillery activity in the Corps area increased somewhat in reaction to the attacks of 5th and 80th Infantry Divisions and included strong interdiction fires on the main road leading into BONTHEIM (U0535). 80th Infantry Division's attack was preceded by a 45-minute artillery preparation upon enemy artillery and troop installations fired by the organic division artillery and [illegible] battalions of XII Corps artillery. The attacks of both divisions were strongly supported by close "on call" artillery fires.

18 February. VIII Corps' attack caught one enemy infantry division in the process of relieving another with the result that quick initial progress was made and the capture of GROSSKAMPENBERG (P9174) and KIRCHFELD (P9273) was accomplished against confused resistance. Enemy defense stiffened thereafter and the attack encountered moderate artillery opposition. 87th Infantry Division on the north flank of the Corps encountered moderate enemy harassing fire upon towns close behind our forward elements, notably KERSCHEIDT (L0393) and HERRENORM (L0967). Both 90th Infantry Division and 11th Armored Division received sharp enemy antitank and infantry gunnen fires as they approached KRINFELD (P9275) and LEIDENBORN (P9172) respectively.

9th and 80th Infantry Divisions attached to the north in the XII Corps sector following extensive preparation fires. Enemy artillery reacted sharply to the attack with fires largely from single pieces.

Several small-scale enemy counterattacks were launched against 26th Infantry Division in the SAARLAUTERN (Q2879) bridgehead, all of which were broken up by the defensive fires of the Division Artillery.

Artillery ammunition expenditures for the period ending at 180600 February were as follows:-

	VIII Corps	XII Corps	XX Corps
British 25-pounder	-	404	1305
105mm Howitzer	39732	76207	22611
155mm Howitzer	927	1202	-
155mm Gun	12710	16783	9047
155mm Gun (SP)	2242	4780	1119
8-inch Howitzer	504	559	304
8-inch Gun	1278	1643	-
240mm Howitzer	6	-	88

One 8-inch Howitzer battalion was relieved from XII Corps and attached to XX Corps.

19 February. 94th Infantry Division attacked at 0400 to clear the SAAR - MOSELLE triangle supported by a strong program of scheduled fires fired by the Division Artillery and five XII Corps artillery battalions. The first fifteen minutes of scheduled fires were directed exclusively upon enemy command post and communications installations. Thereafter all known enemy artillery locations were heavily attacked and neutralized and a twelve-hour harassing and interdiction program was fired on roads and approaches to the battlefields. Subsequent Prisoner of War interrogation brought out the fact that these fires effectively and completely disrupted the enemy's fire communications network and contributed materially to the rapidity of the advance.

10th Armored Division commenced to move from METZ (U85) to attack in the SAAR - MOSELLE triangle on the north flank of 94th Infantry Division. One 155mm Howitzer battalion which had been detached from VIII Corps and attached to XX Corps and one 155mm Gun (SP) battalion were both attached to 10th Armored Division.

20 February. All VIII Corps divisions attacked following an intensive counterbattery program upon twenty-five hostile artillery locations. Artillery with the Corps also fired a very heavy harassing program upon the bridges over the PRUM RIVER and the road net leading thereto.

XII Corps artillery fired an intensive prolonged counterbattery preparation in support of 26 Cavalry Group's attack across the MOSELLE RIVER. Strong and increasing resistance encountered at WINCHERINGEN (L0313) was attacked heavily by the supporting artillery and collapsed, following which the town was taken with little difficulty. 5th Infantry Division continued its advance toward the PRUM RIVER with the assistance of strong artillery support fires.

One 155mm Gun (SP) battery was detached from XII Corps and rejoined its parent battalion in XX Corps. One 8-inch Howitzer battalion was assigned to Third U.S. Army and attached to XII Corps.

21 February. All VIII Corps divisions continued their attack against varying degrees of resistance. 90th Infantry Division encountered high velocity direct fires in the vicinity of LICHTENBORN (P9666). 4th Infantry Division received heavy fires after nightfall from self-propelled guns and rockets emplaced on the high ground east of the PRUM RIVER. 11th Armored Division captured BOSCHEID (P9563) against light enemy artillery fires whereas the forward elements of 9th Armored Division encountered heavy artillery fires in their [illegible] (P9562) and DAHNEN (P9665). An extremely heavy night counterattack was launched against 6th Armored Division in this area but was repulsed with the assistance of heavy defensive fires from the divisional artillery and four battalions of VIII Corps artillery.

Artillery with VIII Corps fired a total of thirty-two counterbattery missions and utilized the smallest observation conditions to fire extremely heavily in close support of the advances. In addition, an extensive harassing and interdiction program was fired against towns, supply points, and road nets in the enemy's rear areas, with particular emphasis upon the crossings of the PRUM RIVER.

Enemy artillery activity in the XII Corps zone continued to be light. 9th Infantry Division Artillery and four battalions of XII Corps artillery fired a preparation for a renewal of the Division attack and subsequently fired several time-on-target concentrations upon enemy troop concentrations in addition to extensive fires upon enemy artillery locations and enemy-occupied towns. 80th Infantry Division likewise was accorded heavy artillery support included in which were sixteen smoke missions and sixteen time-on-target concentrations.

Enemy artillery activity in opposition to the XX Corps advance in the SAAR - MOSELLE triangle was generally light. Artillery with the Corps was organized in support of the attack as follows:-

Attached to 10th Armored Division - one 155mm Howitzer battalion and one 155mm Gun (SP) battalion.
General support, reinforcing 94th Infantry Division - one field artillery group consisting of two light and one medium battalion and one 155mm Gun battery.
General support in the zones of 10th Armored and 94th Infantry Divisions - one field artillery group consisting of three heavy battalions.
General support, reinforcing 26th Infantry Division - one field artillery group consisting of one light, two medium and one heavy battalion.

22 February. The fires of enemy artillery activity opposed to VIII Corps declined substantially as the enemy displaced its artillery to positions echeloned in depth between the PRUM and the KYLL RIVERS. Following its accustomed practice, the enemy emplaced light and medium weapons far back in the rear areas so as to fire upon our forward elements at extreme ranges while minimizing the probability of retaliatory counterbattery fires. VIII Corps artillery continued to fire strongly in support of the advances, utilizing observed fire methods to attack enemy armor, strongpoints and infantry and also firing defensively against small and medium scale counterattacks. No less than forty-seven targets of opportunity were attacked in support of 90th Infantry Division alone and the consequences thereof were seven enemy tanks destroyed, four tanks damaged and fifteen vehicles destroyed in addition to severe personnel casualties.

Artillery opposed to XII Corps continued to consist of approximately twelve battalions. This artillery was employed most actively against forward elements of the 5th Infantry Division but was tending to taper off both here and throughout the Corps zone.

23 February. 94th Infantry Division succeeded in establishing two bridgeheads over the SAAR RIVER. The Division was accorded heavy artillery support upon targets of opportunity including an instance when a 105mm Howitzer battalion was adjusted upon a concentration of some 200 enemy infantry forty of whom were killed. Enemy artillery reaction to the attack was prompt, relatively heavy fires being received at the crossing sites although enemy fires were generally light throughout the remainder of the XX Corps zone. Several severe counterattacks were launched against the bridgehead forces but all were successfully repelled with the assistance of heavy supporting fires, both observed and unobserved, from the divisional artillery and three battalions of XX Corps artillery. An extensive harassing program in support of the bridgehead forces was instituted upon all enemy routes of approach thereto.

24 February. One 4.5-inch Gun battalion and one field artillery observation battery were attached to XX Corps and one 155mm Howitzer battalion was attached to XII Corps, all having been detached from VIII Corps. One 8-inch Gun battery was detached from XII Corps and rejoined its parent battalion in XX Corps. 33d Field Artillery Brigade was detached from Sixth Army Group and attached to XII Corps.

Artillery with XII Corps was organized to support the Corps attack across the PRUM RIVER as follows:-

General support, reinforcing 4th Armored Division - one field artillery group consisting of one light and two medium battalions. (80th Infantry Division was to follow 4th Armored Division and the artillery thereof was to respond to the latter's calls for fire.)
General support, reinforcing 9th Infantry Division - one field artillery group consisting of one light, one medium and one heavy battalion and

DECLASSIFIED

one battery, 155mm Gun (SP).

General support, reinforcing 76th Infantry Division - one field artillery brigade consisting of one medium and two heavy battalions.

Corps fire direction center in zones of 4th armored and 90th and 5th Infantry Divisions - one field artillery group with one heavy field artillery battalion attached.

Corps fire direction center in zones of 76th Infantry Division and 26 Cavalry Group - Headquarters and Headquarters Battery, III Corps Artillery with one light and one medium battalion attached.

Both 76th and 5th Infantry Divisions attacked and secured crossings of the PRUM RIVER following sharp artillery preparations fired by the supporting divisional and Corps artillery. Enemy artillery reaction was generally light with fire increasing in the 76th Infantry Division zone but declining elsewhere throughout the XII Corps area. The attacks were accorded strong artillery support with heavy time-on-target concentrations on Nebelwerfers, infantry, strongpoints, mortars, vehicles and machine guns.

XII Corps' attack encountered relatively light artillery fires, the bulk of which were harassing fires on the forward elements of 10th Armored Division in ZEMMER (L1206) and ATH (L1415), and upon 94th Infantry Division's bridge site at TABEM (L1706).

Artillery liaison-type aircraft proved essential in supplying the isolated 4th Ranger Battalion, attached to 94th Infantry Division. Fifty-six sorties were flown in the face of heavy enemy machine gun fire to drop ammunition, rations, medical supplies and blankets to the troops isolated at SINNIG (L1709).

90mm tank destroyers and 105mm Howitzers were frequently employed in coordination to attack and reduce pillboxes. The artillery was first adjusted upon the pillbox, following which the tank destroyer attacked the pillbox with direct fire methods to effect penetrations and force the personnel into the open, whereupon the artillery immediately fired for effect against personnel.

25 February. One field artillery group was attached to XX Corps and one 8-inch Howitzer battalion was attached to XII Corps, both being relieved from VIII Corps.

4th Armored Division attacked in the XII Corps area. To maintain surprise, no artillery preparation was fired but time-on-target concentrations were placed in turn upon all towns and strongpoints immediately prior to the assault thereof. At least twenty such concentrations were fired during the period with the divisional artillery and four supporting Corps battalions joining in. With the assistance of this support, the Division advanced to and captured KITTLINGEN (L1156). 5th Infantry Division kept pace on the south flank of 4th Armored Division and was likewise accorded strong artillery supporting fires.

Enemy artillery fire in the XX Corps area decreased sharply, the fire being lifted from the bridgehead areas and approaches thereto and being placed instead upon the forward elements of 10th Armored and 94th Infantry Divisions. Exceptionally strong enemy counterattacks were launched against 94th Infantry Division in the vicinity of (L1711) and (L1811). Both were repulsed after sharp fighting strongly supported by 94th Infantry Division Artillery and three battalions of supporting Corps artillery.

Artillery ammunition expenditures for the period ending at 250600 February were as follows:-

	VIII Corps	XII Corps	XX Corps
British 25-pounder	-	685	2777
105mm Howitzer	52961	102219	48166
4.5-inch Gun	843	1450	242
155mm Howitzer	17027	26799	16590
155mm Gun	4831	6587	3452
155mm Gun (SP)	785	447	1123
8-inch Howitzer	4066	3989	2681
8-inch Gun	-	-	384
240mm Howitzer	44	-	815

26 February. 90th Infantry Division was relieved from VIII Corps and placed in Supreme Headquarters Allied Expeditionary Force reserve. One armored field artillery battalion was detached from VIII Corps and attached to XII Corps.

The enemy having generally been cleared from the Corps zone west of the PRUM RIVER, VIII Corps resumed its attack to the east to seize HALLSCHLAG (L0997), ORMONT (L0997) and the high ground southeast of KRONEBERG (L1096). Artillery with the Corps was organized in support as follows:-

General support, reinforcing 87th Infantry Division and 4th Infantry Division with one 155mm howitzer battalion each - one field artillery group consisting of one light battalion, two medium battalions, one 155mm Gun (SP) battery and one 240mm Howitzer battery.

General support, reinforcing 4th Armored Division and 4th Cavalry Group with one 155mm Howitzer battalion each - one field artillery group consisting of two armored field artillery battalions, two medium battalions and one 155mm Gun (SP) battalion (less one firing battery).

General support - one field artillery group consisting of one armored field artillery battalion, one medium battalion and one heavy battalion.

Corps Artillery fire direction center - Headquarters and Headquarters Battery, VIII Corps Artillery with two field artillery observation battalions (less one letter battery) in support and one field artillery group attached consisting of one 4.5-inch Gun battalion, two 155mm Gun battalions and one 240mm Howitzer battalion (less one firing battery). One field artillery group was employed as an auxiliary Corps fire direction center.

VIII Corps' rapid advance toward the KYLL RIVER continued against light artillery opposition with strong fires from our supporting artillery. 4th Armored Division Artillery and Corps artillery in support thereof fired extensively upon many targets of opportunity, including tanks, self-propelled and antitank guns and personnel. Time-on-target concentrations were fired upon four towns in the division zone of advance and harassing and interdiction fires were placed on eighteen towns. Organic and Corps artillery supporting 5th Infantry Division continued to fire strongly upon enemy artillery locations, infantry dispositions and Nebelwerfers.

The enemy launched extremely heavy counterattacks against the 5th Ranger Battalion, attached to 94th Infantry Division. Defensive artillery fires were powerful, a single XX Corps artillery battalion firing no less than twenty-six missions in support of the 4th Ranger Battalion's successful defense. Three additional XX Corps battalions and the organic artillery of 94th Infantry Division also participated heavily in these defensive fires.

27 February. 6th Armored Division established a bridgehead over the [illegible] in the VIII Corps zone against moderate resistance. Enemy artillery reaction to the attack was prompt and considerable harassing fires were received in the bridge sites at LUXBACH (L2072) and HELMSHAUSEN (L2069).

Artillery of VIII and XII Corps combined to conduct a coordinated anti-flak program of continued neutralizing fires upon four heavy antiaircraft batteries on the route of approach of 1,200 heavy bombers belonging to the eighth U.S. Air Force. The fires were conducted for approximately ninety minutes as the bombers flew into Germany and were repeated on the return flight.

Strong "on call" preparation fires were continued on towns and strongpoints in the XII Corps zone as 4th Armored Division continued its advance and turned to the north. FLIESSEM (L1459), MATTENHEIM (L1258) and MATZEN (L1457) were attacked with massed time-on-target fires of six battalions immediately prior to the armor's assault thereof.

Two 155mm Howitzer battalions and headquarters and headquarters battery, one field artillery observation battalion were detached from VIII Corps and attached to XII Corps.

28 February. VIII Corps launched a coordinated attack to take the high ground west of the KYLL RIVER in the Corps zone and to effect a junction with XII Corps in the vicinity of OBERSKEN (L1070). Enemy artillery reaction to the attack was moderate to heavy and included considerable mortar and rocket fires. The bulk of the enemy fire was directed against our river crossings and leading elements. Heavy prolonged fighting occurred along the entire Corps front, particularly in the vicinity of ORMONT (L0997), KLEINLAMSCHEID (L1196) and SACKSCHEID (L1369).

4th Armored Division encountered heavy opposition in the woods south of SCHWARZLICH (L1363) which were strongly defended with infantry reinforced by antitank guns, machine guns and mines. Eleven time-on-target concentrations in which six artillery battalions participated were fired in support of the armor's attack upon the woods.

10th Armored Division swung north in the XX Corps zone in the direction of TRIER (L2129). Enemy artillery fires in opposition to the attack were generally light, consisting almost entirely of observed fires against the leading elements of 10th Armored Division and upon the towns of MALBERGERF (L2212) and BRUNIG (L1512).

Analysis of Arty/L missions for the month disclosed that of a total of eighty missions requested, forty-two could not be flown because of unfavorable weather conditions and thirty-eight were flown of which twenty-seven were successful. Eleven missions were unsuccessful, seven because of weather, one because of communications failure and three for other reasons. The twenty-seven successful missions attacked a total of forty-two targets.

Throughout the period. The month of February saw Third U.S. Army steadily and relentlessly drive its way through the vaunted defenses of the SIEGFRIED LINE against an enemy who extracted the maximum advantage from the heavy defensive terrain and many river lines that had to be crossed.

Artillery with the Army proved a useful and versatile aid in the reduction of the thousands of pillboxes encountered. 90mm tank destroyer guns and 105mm Howitzers were employed as teams, the former by direct fire to blast a penetration, the latter by indirect fire to destroy the fleeing personnel. 155mm Guns (SP) were employed in a direct fire role with outstanding success. The 8-inch Howitzer against demonstrated its high worth as a powerful precision weapon.

The river lines of the OUR, the SAUER, the PRUM and the SAAR, all ably and aggressively defended, added to the difficulties of the assaulting forces. A coordinated attack was necessary to effect the reduction of each. These attacks were uniformly accorded the heaviest kind of artillery support consonant with the availability of ammunition. In some cases a very heavy artillery preparation was fired, in others the preparation was omitted to preserve the surprise element of a night assault. In all cases the jump-off of the attack was the signal that touched off an extremely heavy program of coordinated scheduled fires as well as close support fires on call.

Throughout the month the artillery continued its program of relentless harassing of all enemy dispositions that could be brought within range. No movement could be made with impunity, no troop assembly or supply dump was safe, nowhere could the constantly harassed enemy find surcease.

★ ★ ★

CHAPTER 10
MARCH OPERATIONS

1 March. 10th Armored Division completed the capture of TRIER (L2090) which thus became the first large German city to fall to Third U.S. Army. 76th Infantry Division driving south effected a junction with the armor north of the city thereby encircling and assuring the destruction of the enemy forces still manning the SIEGFRIED LINE positions west of TRIER. Enemy artillery fires throughout the XX Corps zone were light with the bulk of them being directed against our forward elements in the vicinity of ZEMM (L2411).

Heavy fighting was in progress on the extreme north flank of the Army, notably in the vicinity of ORMONT (L0997), where 87th and 4th Infantry Divisions continued to drive their way through the highly organized defenses of the SIEGFRIED LINE. Enemy artillery activity in this area ranged from moderate to heavy with particularly extensive use of rockets upon both our leading elements and upon our supply routes and installations. Artillery with VIII Corps fired heavily in close support of the attacking forces as favorable observation conditions enabled the extensive use of observed fires upon targets of opportunity.

Ten battalions of artillery with XII Corps fired a ten-minute preparation on SEFFERWEICH (L1363) and the wooded area to the north, following which a 4th Armored Division tank battalion assaulted and seized the town, taking some 200 prisoners and suffering no casualties. Artillery with XII Corps fired numerous time-on-target concentrations upon targets of opportunity in support of the advances of the 4th Armored Division. Enemy artillery fires in the Corps zone ranged from light to moderate and tended to decrease in inverse proportion to the progress of our attack.

Digitized by Google

3 March. Heavy fighting continued in the VIII Corps zone as the 87th Infantry Division pushed forward from CREUTZ (L0093) against determined resistance and cleared sixty-two pillboxes. The enemy continued to utilize rockets on a large scale and divisional and supporting VIII Corps artillery continued to support the attack with massed observed fires upon targets of opportunity.

Enemy artillery activity increased sharply in the XX Corps zone and included 170mm guns firing into IRSCH (L2525) and KIRF (L2411). XX Corps Artillery instituted an extensive counterbattery program embracing twenty-two enemy artillery locations following which the severity of the enemy fires declined.

3 March. 87th Infantry Division continued its slow but inexorable progress through the SIEGFRIED LINE in the VIII Corps zone reducing an additional twenty-eight pillboxes. Both 6th and 11th Armored Divisions effected substantial advances against extremely light enemy artillery opposition, the former crossing the KIMS RIVER and capturing HETTELDORF (L0973) and the latter seizing FLAMISCHEN (L1179) and the high ground to the east.

76th Infantry Division Artillery together with three battalions of supporting XII Corps artillery fired a two-hour artillery preparation in support of the Division attack to secure bridgeheads over the KYLL RIVER in the vicinity of PHILST (L2046) and OBERHOFEN (L2245). Moderate enemy resistance coupled with a sharp increase in enemy artillery fires was encountered but the bridgehead was firmly established with the assistance of strong observed and harassing fires from supporting artillery. A severe counterattack against 4th Armored Division's bridgehead east of the KYLL RIVER was repelled with the assistance of strong artillery defensive fires.

Artillery with XII Corps was organized to support the crossings of the KYLL RIVER and the continuing offensive to the east as follows:-

General support, reinforcing 76th Infantry Division with one light and two medium battalions - 334 Field Artillery Brigade consisting of one light, two medium and one heavy battalion.
General support, reinforcing 4th Armored Division with one light and two medium battalions - one field artillery group consisting of one light, two medium and one heavy battalion.
General support, reinforcing 5th Infantry Division with one light and two medium battalions - one field artillery group consisting of one light, two medium and one heavy battalion.
Corps fire direction center in zones of 4th Armored and 5th Infantry Divisions - one field artillery group consisting of one field artillery observation headquarters battery and one field artillery observation letter battery with one heavy artillery battalion attached.

Corps fire direction center in zone of the 76th Infantry Division - Headquarters and Headquarters Battery, XII Corps Artillery with one field artillery observation battalion (less one letter battery) attached.

4 March. Artillery with VIII Corps fired extensive harassing and interdiction missions upon all bridges over the KYLL RIVER in support of 11th Armored Division's attack and upon all road junctions and critical traffic points in the vicinity of BUDESHEIM (L1461) and WALLERSHEIM (L1379).

XII Corps encountered generally light enemy artillery opposition with the exception of moderate mortar and artillery concentrations against 76th Infantry Division's forward elements in the bridgehead area. Two small-scale counterattacks against the bridgehead were readily repelled with the assistance of the Division Artillery.

Air CP Bulletin Number 7, copy attached, Annex 17, was published.

Artillery ammunition expenditures for the seven-day period ending 060600 March reflect generally heavy fighting throughout the Army front as VIII Corps and XX Corps continued to push through the SIEGFRIED LINE and XII Corps crossed the KYLL RIVER. Expenditures were as follows:-

	VIII Corps	XII Corps	XX Corps
British 25-pounder	-	132	1990
105mm Howitzer	46855	49190	43877
4.5-inch Gun	561	3928	4858
155mm Howitzer	13861	20094	12975
155mm Gun	4179	2964	1489
155mm Gun (SP)	1476	-	374
8-inch Howitzer	2261	4160	2337
8-inch Gun	-	-	202
240mm Howitzer	83	-	368

5 March. 90th Infantry Division attained the VIII Corps objective with its capture of DREHBORN (L1970) and continued on to clear HOMMERICHEN (L2075) and MORLESBACH (L1872). Enemy reaction to the fall of these towns included severe artillery, rocket and mortar fires, mostly from positions northeast of the KYLL RIVER. VIII Corps Artillery initiated an extensive counterbattery program following which LINSCHEID (L2180) was taken without opposition.

6th Armored Division was detached from VIII Corps and assembled in Supreme Headquarters Allied Expeditionary Force reserve. Artillery with the Corps was thereupon organized to support the continuing Corps attack as follows:-

Attached to 4th Infantry Division - one medium battalion.
General support, reinforcing 87th Infantry Division - one field artillery group consisting of one light, two medium and one heavy battalion.
General support, reinforcing 90th Infantry Division - one field artillery group consisting of one light and two medium battalions.
General support, reinforcing 11th Armored Division and to be attached thereto upon call - one field artillery group consisting of one armored field artillery battalion, one medium battalion and one 155mm Gun (SP) battalion.
General support - one field artillery observation battalion with one field artillery observation letter battery attached and two field artillery groups consisting of four heavy battalions.

In a desperate attempt to restore the unhinged defenses of the SIEGFRIED LINE, the enemy launched the first in a series of heavy counterattacks that persisted until 10 March against 10th Armored and 94th Infantry Divisions in XX Corps' northern bridgeheads over the SAAR RIVER. The enemy employed extensive artillery fires in support of the counterattacks and occasionally preceded them with severe artillery preparations. These fires were directed largely against our forward elements with a secondary emphasis upon the river crossings in the vicinity of SAARBURG (L1413) and TABEN (L1706). XX Corps Artillery fired extensive counterbattery programs throughout the period and both Corps and divisional artillery rendered material aid with intensive planned and observed defensive fires. In one instance seven artillery battalions attacked a large group of enemy infantry assembling in the vicinity of (L2803) to counterattack, dispersing it with heavy casualties.

6 March. Five battalions of artillery with VIII Corps fired a 500-round, ten-minute artillery preparation upon enemy mortar positions and observation posts east of the KYLL RIVER following which 90th Infantry Division executed a successful crossing. The Corps artillery continued to support the attack with extensive harassing and interdiction fires upon the crossings of the KYLL RIVER and upon supply routes and installations east of the river. The bridgehead was firmly established despite intensive enemy direct fire of high velocity weapons against the crossing sites.

4th Armored Division captured a bridge intact at OBERSTADTFELD (L3175) and immediately fanned out to press the attack to the east. 11th Armored Division in the VIII Corps sector effected a comparable breakthrough on the succeeding day. Both divisions advanced rapidly, for the most part running rough-shod over small isolated pockets and occasionally encountering sizeable determined enemy groups whereupon brief but sharp fire fights ensued. One such instance occurred at MULHEIM (L2709) where 4th Armored Division encountered strong enemy anti-tank fires that were attacked and neutralized by the accompanying artillery. Similarly supporting artillery was of material assistance in overcoming entrenched infantry and tanks that sought to hold 11th Armored Division near KEIPENAG (L4297).

Enemy artillery opposition to the advances was virtually non-existent, the great mass of the enemy artillery having been overrun by the speed and power of the armored spearheads. Divisional and Corps artillery displaced rapidly to follow closely behind the leading tanks and armored infantry and in the few heavy localized engagements, rendered extremely effective fires in close support upon targets of opportunity. The armored advances swept on. 4th Armored Division reached the RHINE RIVER on 8 March with 11th Armored Division establishing a junction with First U. S. Army and clearing AMDERHACH (F7604) on 9 March.

7 March. 99th Infantry Division and one 8-inch Howitzer battalion, both newly arrived and assigned Third U.S. Army, were attached to XII Corps and VIII Corps respectively.

8 March. One 8-inch Howitzer battalion, newly arrived and assigned Third U.S. Army, was attached to XX Corps.

XII Corps continued to encounter only light harassing enemy artillery fires. The Corps was opposed by an estimated six battalions of enemy artillery of considerably diminished effectiveness because of destroyed and overrun but unreplaced materiel. There was evidence that most enemy artillery of foreign manufacture, including Russian and Italian weapons, had been withdrawn to collecting points east of the RHINE RIVER due to the exhaustion of available ammunition.

9 March. One field artillery group headquarters, newly arrived and assigned Third U.S. Army, was attached to XX Corps. One 155mm Gun battalion, its basic weapons having arrived, was relieved from duty with the Provost Marshal, Third U.S. Army and attached to XII Corps.

The tactical situation in the VIII Corps zone continued fluid with no evidence of organized resistance east of the RHINE RIVER. Opposition west of the river consisted entirely of wandering bands of isolated enemy troops and occasional snipers. The rapidity of the advance and the lack of organized resistance offered few targets for the accompanying artillery and supporting fires were consequently light. The bulk of VIII Corps artillery was assembled in rendezvous area to inaugurate a brief program of maintenance in preparation for rapid movement to the east.

Third U.S. Army artillery attacked enemy shipping on the RHINE RIVER for the first time, one XII Corps artillery battalion sinking one tugboat and two barges. Stern enemy resistance at GROSSLITTGEN (L3358) and MUSCHEILER (L3356) was smashed with the assistance of heavy fires from the accompanying artillery. Enemy artillery fires were generally light throughout the XII Corps zone with the exception of moderate to heavy direct fire from the vicinity of NEUERKIRCH (F8002).

10 March. XII Corps' advance along the north bank of the MOSELLE RIVER continued unchecked with great quantities of enemy materiel and supplies being overrun, a single task battalion capturing seventy-one enemy artillery, antitank and antiaircraft weapons. Enemy artillery fires opposing our advances were light, the heaviest concentrations being light caliber fires at NEHLINGEN (L4354) and NONNGUSEN (L4355). Artillery with XII Corps displaced frequently in close support of the leading elements and also fired a large-scale program of harassing and interdiction missions upon enemy escape routes to the east and southeast and upon all enemy-occupied towns that could be brought within range.

11 March. VIII Corps artillery did no firing during the period as all Corps artillery moved eastward to take up positions along the west bank of the RHINE RIVER. Only light enemy artillery fires were encountered from positions on the east bank of the river, the heaviest concentration consisting of mixed light caliber artillery and mortar fires in the vicinity of URMITZ (F8402).

Motorized infantry having followed closely behind the leading armor and having turned south after the RHINE was reached, XII Corps had now cleared the north bank of the MOSELLE RIVER from KOBLENZ (L8095) to CARDEM (L6775). The infantry fighting had been almost entirely a matter of scraping up isolated pockets by-passed by the advancing armor and involved heavy fighting only in isolated instances. Organic and corps artillery had moved in close support of the motorized infantry and rendered heavy and effectual assistance in the dissolution of the few pockets of resistance.

The city of LUXEMBOURG (P81) again was shelled by a 280mm railroad gun, one round of which landed in immediate proximity to Third U.S. Army's Command Post. Damage generally was slight despite two military and an estimated ten civilian deaths. XX Corps Artillery obtained several sound locations and fired heavy long-range counterbattery missions to silence the enemy weapon.

Artillery ammunition expenditures for the week ending 110600 March reflected the continuation of stern fighting in the southern portion of the Army zone as XX Corps repulsed numerous counterattacks. In the remainder of the Army area artillery ammunition expenditures declined fifty per cent from the level of the preceding week as a result of the sweeping advances and highly fluid tactical situation. The figures are as follows:-

	VIII Corps	XII Corps	XX Corps
British 25-pounder	-	184	1038
105mm Howitzer	22691	18817	50528
4.5-inch Gun	510	3203	2690
155mm Howitzer	5752	897	12283
155mm Gun	2377	2615	1239
155mm Gun (SP)	277	-	816
8-inch Howitzer	379	2381	2444
8-inch Gun	-	-	158
240mm Howitzer	32	-	461

12 March. 4th Infantry Division, 6th Armored Division, two 155mm Howitzer battalions and one 155mm Gun battalion were detached from VIII Corps and relieved from assignment to Third U.S. Army. One field artillery group headquarters, two 4.5-inch Gun battalions and one 155mm Gun battalion were detached from VIII Corps and attached to XII Corps.

General regrouping and mopping up of isolated enemy remnants was in progress throughout the VIII and XII Corps zones. XII Corps Artillery

Digitized by Google

attacked the railroad yards at KOBLENZ (L9095) for the first time and these fires were thereafter continued on a heavy scale.

90th Infantry Division was relieved from XII Corps and attached to XX Corps and the artillery thereof displaced to forward positions so as to support the impending attack of the Division.

13 March. 90th Infantry Division was detached from VIII Corps and attached to XII Corps.

XX Corps attacked in force out of its northern bridgeheads over the SAAR RIVER. Artillery with the Corps was organized in support of the attack as follows:-

General support, reinforcing 26th and 80th Infantry Divisions - one field artillery group consisting of one light, one medium and one heavy battalion.
General support, reinforcing 80th Infantry Division - one field artillery group consisting of one light and one medium battalion.
General support, reinforcing 26th Infantry Division initially and 10th Armored Division when committed - one field artillery group consisting of one light and two medium battalions.
General support, reinforcing 14 Cavalry Group - one field artillery group consisting of one light battalion and one 155mm Gun (SP) battalion.
Attached to 65th Infantry Division - one medium battalion, one 8-inch Howitzer battalion and one 8-inch Gun battery.
General support - one field artillery group consisting of two heavy and one 8-inch Gun battalion (less one battery).

A two hour artillery preparation preceded the attack in the zone of the 26th Infantry Division with extensive preparations also being fired in support of the 80th and 90th Infantry Divisions. A large-scale demonstration including heavy artillery fires was staged by the 65th Infantry Division at SAARLAUTERN (Q2877) to simulate an attack in strength in that area and so divert attention from the main attack. Numerous small-scale counterattacks were encountered but the attack progressed favorably with the assistance of strong close-in fires from the supporting artillery. A notably heavy concentration was that placed upon the town of WADERNATH (Q2377) by 26th Infantry Division Artillery and three battalions of XX Corps artillery. The large scale of artillery support of the attack was reflected by the expenditure of 27,716 rounds of ammunition by artillery with XX Corps on this date.

14 March. Battery A, 298th Field Artillery Observation Battalion was detached from VIII Corps and attached to XII Corps where it rejoined its parent organization.

VIII Corps received extremely light enemy artillery fires consisting of small-scale shellings in the vicinity of BUBENHEIM (L8697) and in the outskirts of ANDERNACH (F7404).

XII Corps attacked south to secure crossings of the MOSELLE RIVER southwest of KOBLENZ (L9095). The attack was preceded by a one-hour artillery preparation concentrated almost entirely on towns to the immediate front of the assault waves of the 5th and 90th Infantry Divisions. Rapid initial progress was made to the vicinity of ALKEN (L7982) and BURGEN (L7778) before stiffening resistance was encountered. Artillery with the Corps fired extensive harassing and interdiction missions in continuing support of the attack as well as many missions for destruction or neutralization of targets of opportunity. All enemy escape routes were also heavily attacked by our artillery fires.

89th Infantry Division effected an additional crossing of the MOSELLE RIVER in the XII Corps zone on 14 March in the wake of a 50-minute, five-battalion artillery preparation. The attack encountered only light initial resistance and advances were rapid.

4th and 11th Armored Divisions passed through the infantry bridgeheads and fanned out to the south to resume the swift pursuit and envelopment of the disorganized and utterly confused enemy forces. The pattern of armor closely accompanied by supporting corps artillery and followed by motorized infantry, also closely accompanied by supporting artillery, was resumed and large advances were swiftly made. An especially sharp fight was encountered by the armor in the vicinity of BAD KREUZNACH (M0919) where the enemy made a determined stand in an effort to hold the north flank of his escape routes to the east across the RHINE RIVER. The accompanying artillery rendered strong assistance with heavy supporting fires and after heavy fighting the backbone of the enemy stand was broken and the advance was resumed.

15 March. One field artillery group headquarters, newly arrived and assigned Third U.S. Army, was attached to VIII Corps.

Artillery with VIII Corps generally displaced to new positions from which to support the impending attack across the MOSELLE RIVER against KOBLENZ (L9095) and the enemy forces defending on the west bank of the RHINE RIVER. 11th Armored Division Artillery (less one battalion) was placed in support of the 4th Cavalry Group screening the left flank of the Corps generally along the RHINE RIVER. Enemy artillery fires in the Corps zone were light and scattered, increasing slightly during the hours of darkness. Heavy caliber artillery fell at RUDESHACH (L8476).

XII Corps' advance continued rapidly against disorganized resistance. The enemy attempted large-scale withdrawals of his forces to the south and east that heavily taxed the available road net and resulted in extreme traffic congestion. The traffic jams were heavily attacked by all available artillery with XII Corps with numerous time-on-target concentrations and extremely heavy casualties were inflicted.

Artillery with XX Corps continued to fire heavily in close support of the Corps attack and excellent progress was made along the entire front. Supporting artillery fires inflicted heavy casualties upon the enemy. Enemy artillery reaction to the attack became increasingly light with indications that the bulk of the enemy artillery had been either overrun and destroyed or forced to withdraw.

16 March. VIII Corps employed the 97th Infantry Division to effect crossings of the MOSELLE RIVER immediately southwest of KOBLENZ (L9095). Enemy artillery fires in reaction to the crossings were initially light and were concentrated for the most part upon the crossing sites. The attack was supported by the close-in fires of the supporting artillery upon targets of opportunity, coupled with a counterbattery program upon enemy artillery locations in the triangle formed by the RHINE and MOSELLE RIVERS south of KOBLENZ. The Corps Artillery also instituted a program of long-range harassing and interdiction fires upon the autobahn on the east bank of the RHINE leading northwest toward First U.S. Army's bridgehead in the vicinity of REMAGEN (F4629). Isolated instances of heavy street fighting occurred in KOBLENZ and a determined stand was made by a small group of enemy in the ancient fortress of FORT CONSTANTIN. Artillery forward observers moved with the leading infantry elements to adjust heavy observed fires upon close-in enemy strongpoints. KOBLENZ was cleared and all resistance overpowered on 18 March.

The XII Corps front continued highly fluid as the attack progressed rapidly to the south and southeast. A combination of air and XII Corps Artillery attacked enemy at empts to evacuate his forces by ferrying across the RHINE RIVER at BOPPARD (L8981), sinking eight barges and four steamboats, all heavily loaded.

The attack in the northern portion of the XX Corps zone continued with all divisions making rapid progress especially in the area east of BERNCASTEL (Q2994). All divisions were strongly supported with close-in artillery fires as well as preparation fires in support of localized assaults. 65th Infantry Division attacked in the SAARLAUTERN (Q2870) area with heavy artillery support and effected an expansion of the bridgehead. Enemy fires throughout the Corps zone were light and, as was customary, were directed largely upon road nets and probable observation posts and included some harassing of the towns of GREIMERATH (L2307) and KELL (L2315).

17 March. 89th Infantry Division was attached to Third U.S. Army and VIII Corps.

90th Infantry Division advanced rapidly south along the east bank of the RHINE RIVER in the XII Corps zone and cleared BOPPARD (L8981). Artillery with the Division fired numerous observed missions upon river shipping used to ferry personnel and equipment and destroyed five barges.

Organized resistance in front of XX Corps finally collapsed in the face of the relentless and ever-increasing pressure of our heavily attacking infantry. 10th Armored Division passed through the infantry and went on to BIRKENFELD (L5917) as this portion of the Army front also became highly fluid. One fleeing enemy vehicular column four kilometers long in the vicinity of OBERSTEIN (L5907) was attacked by combined air and long-range artillery with XX Corps and utterly destroyed.

18 March. 11th Armored Division continued its rapid advance in the XII Corps zone against sporadic opposition with 80th Infantry Division following in trace behind the armor to clear by-passed enemy pockets. Enemy artillery reaction as the attack progressed was light to negligible throughout the Corps zone. A platoon-scale armored counterattack against 4th Armored Division was detected by an air OP while in the process of forming. Observed fires of three XII Corps artillery battalions were adjusted upon and dispersed the enemy concentration, destroying or immobilizing sixteen tanks and additional vehicles of other types.

XX Corps generally was reorganizing in preparation for continuation of the Corps attack to the east and southeast. Most artillery with the Corps displaced to new positions whence to support the impending attack. 10th Armored Division engaged in heavy fighting northwest of ST WENDEL (Q5977) with heavy supporting fires from the accompanying artillery. Enemy artillery fires increased considerably in the 65th Infantry Division zone as it continued to press forward out of the SAARLAUTERN (Q2877) bridgehead and cleared BILLINGEN (Q2964).

12th Armored Division was attached to Third U.S. Army and to XX Corps. Artillery with the Corps was thereupon organized for support of the continuing attack as follows:-

General support, reinforcing 26th and 80th Infantry Divisions - one field artillery group consisting of one light, one medium and one heavy battalion.
General support, reinforcing 10th Armored Division - one field artillery group consisting of one light and two medium battalions.
General support, reinforcing 12th Armored Division - one field artillery group consisting of one light and two medium battalions.
General support, reinforcing 65th Infantry Division - one field artillery group consisting of one medium and one heavy battalion.
General support - one field artillery group consisting of three heavy battalions.

Artillery ammunition expenditures for the week ending at 180600 were extremely heavy as XX Corps launched its powerful attack to break out of the defenses of the SIEGFRIED LINE, moderately heavy as XII Corps effected its crossings of the MOSELLE and advanced to the south, and generally light as VIII Corps held the left flank of the Army along the RHINE RIVER and cleared KOBLENZ (L9095). The expenditures were as follows:-

	VIII Corps	XII Corps	XX Corps
105mm Howitzer	10091	53657	90342
105mm Howitzer, M3	-	-	1362
4.5-inch Gun	280	2211	2525
155mm Howitzer	3857	15527	29035
155mm Gun	745	5898	3459
155mm Gun (SP)	471	-	2074
8-inch Howitzer	585	2114	4804
8-inch Gun	-	-	461
240mm Howitzer	76	-	744

19 March. Enemy artillery fires in the VIII Corps area increased as the enemy occupied positions on the far bank of the RHINE RIVER east and northeast of KOBLENZ (L9095). Artillery with VIII Corps fired extensive counterbattery missions following which the enemy fires declined considerably. The Corps artillery also continued its heavy harassing of the enemy's attempted water-borne passages of the RHINE RIVER.

11th Armored Division encountered determined resistance as the enemy fought a strong delaying action in an effort to hold his flanks while seeking to extricate the forces rapidly being enveloped by our armored spearheads. Extensive road blocks, destroyed bridges and anti-tank fire were encountered, particularly at WOLFSHEIM (M2211) and POLEKHEIM (M1417). Both self-propelled and antiaircraft guns were used to supplement the defenses of the road blocks and 11th Armored Division Artillery and three battalions of supporting XII Corps artillery fired in strong support of the Division's advance. Enemy resistance throughout the remainder of the XII Corps zone was disorganized and sporadic and was devoid of enemy artillery support.

Resistance in the XX Corps zone disintegrated rapidly as swift advances were registered in the northern portion of the Corps zone. These advances completely outflanked the SIEGFRIED LINE and enabled 65th Infantry Division to press forward out of the SAARLAUTERN (Q2877) bridgehead, thereby culminating a determined enemy stand of four months' duration. Enemy artillery fires were negligible throughout the XX Corps zone and our artillery, displacing frequently to accompany the rapidly advancing armor and infantry, received but few calls for supporting fires.

20 - 22 March. This period was marked by swift armored advances by-passing great enemy cities which were then assaulted and seized, occasionally after severe fighting, by motorized infantry following the armor. WORMS (M4417) and KAISERSLAUTERN (M0394) fell on 20 March, LUDWIGSHAFEN (M5198) on 21 March and MAINZ (M1854) on 22 March. Moderate resistance was encountered both at KAISERSLAUTERN and LUDWIGSHAFEN and particularly heavy opposition necessitating the repeated employment of localized artillery preparation fires was encountered before MAINZ was taken by assault.

20 March. Artillery with VIII Corps fired extensive missions of all types, including counterbattery fires upon fifty-seven enemy artillery locations, harassing and interdiction fires and numerous observed fires upon targets of opportunity including personnel, vehicles, rail-

Digitized by Google

DECLASSIFIED

road trains and enemy observation posts. Enemy artillery opposition to XII Corps' advance continued negligible with a few isolated rounds of light caliber fire falling in the vicinity of the bridge sits at (M2342). There was however a very considerable enemy air reaction against the leading elements of 4th Armored and 90th Infantry Divisions.

21 March. One 8-inch Howitzer battalion, newly arrived and assigned to Third U.S. Army, was attached to XX Corps.

Enemy artillery opposition to VIII Corps continued extremely light along the entire Corps front but for moderate employment in a ground role of antiaircraft guns firing from positions east of KNELLMÜNSTER (L8195). Excellent observation facilitated VIII Corps' extensive artillery fires upon the enemy's frantic searches for escape routes and heavy casualties were inflicted.

22 March. Third U.S. Army crossed the RHINE RIVER. The initial crossing was effected by 5th Infantry Division on the night of 22 - 23 March using surprise tactics under cover of darkness with no artillery preparation fires. The bridgehead was rapidly and successfully consolidated and expanded to a depth of approximately five miles with the assistance of extremely heavy supporting artillery fires on targets of opportunity. 5th Infantry Division Artillery and supporting XII Corps artillery also fired a large-scale program of harassing and interdiction fires on all enemy routes of approach to the bridgehead. The rapidity of our advance to the river and the prompt crossing had denied the enemy opportunity to coordinate his defenses with the result that initial enemy artillery reaction to the crossing was but light to moderate and came largely from light caliber self-propelled weapons. There was however a strong enemy air reaction with repeated bombing and strafing of the bridgehead areas.

28th Infantry Division was relieved from attachment to VIII Corps and Third U.S. Army. 76th Infantry Division was relieved from assignment to XII Corps and was assigned to VIII Corps.

Enemy artillery fires in the VIII Corps zone were light except for moderate concentrations upon the 87th Infantry Division from 88mm gun positions on the east bank of the RHINE RIVER. Artillery with VIII Corps fired extensive counterbattery fires upon enemy artillery and antiaircraft locations in the vicinity of BECHELN (L9988) and KAISERBACH (L9998) and also harassed enemy troop concentrations, command posts and supply routes on the east bank of the river including a Gestapo Headquarters in HERXHEIM (M8002).

Opposition stiffened considerably on the southeast flank of XX Corps with 10th Armored Division encountering particularly heavy resistance in the vicinity of NEUSTADT (M2984) as the enemy sought to hold open his last escape route over the RHINE RIVER at SPEYER (M5079). The remainder of XX Corps continued its swift pursuit of the fleeing and disorganized enemy so that divisional and reinforcing Corps artillery with 12th Armored and 26th, 69th and 80th Infantry Divisions fired not a single mission during the period. One Corps artillery battalion in support of these units displaced no less than four times during the period as the bulk of the Corps closed upon the west bank of the RHINE RIVER. All enemy artillery in the Corps zone west of the river was considered completely eliminated with at most a negligible amount having escaped to the east bank.

A letter was published to all subordinate field artillery and tank destroyer units embracing the observations and recommendations of a civilian technical observer who served on temporary duty with the Artillery Section, Third U.S. Army. This observer had spent long periods of time with the using units in accordance with a schedule coordinated by Third U.S Army Headquarters. He conducted unit schools for enlisted technicians in the alignment and operation of field artillery radios and also sought out the problems of the using units with the equipment in the field and analyzed the various field expedients that had been adopted, including the suggestion of many of his own.

Planning for XII Corps' attack across the RHINE RIVER had included contemplated use of artillery liaison airplanes to transport assault infantry. A full-scale test was conducted during which one infantry company, complete with all organic weapons and basic ammunition loads, had been transported over a comparable distance in a period of approximately ninety minutes employing twelve aircraft. It was planned to transport three rifle companies and one heavy weapons company, all fully equipped, in an estimated period of not more than three hours employing ninety field artillery aircraft. All necessary pilots and aircraft were assembled and the operation was cancelled only because of the extremely rapid advance made by the initial water-borne troops in consequence of which the air-borne operation became unnecessary.

23 March. A sharp increase occurred in enemy artillery fires in the XII Corps zone the bulk of which was directed against 5th Infantry Division's bridgeheads across the RHINE RIVER. The enemy fires emanated almost entirely from antiaircraft guns employed in a ground role as a substitute for the decimated enemy artillery. 5th Infantry Division Artillery reinforced by three battalions of XII Corps artillery fired a large-scale preparation early in the period and thereafter there were intensive fires upon close support missions. A strong counterattack at TREBUR (M4847) was repulsed with the assistance of heavy defensive artillery fires and an enemy OCS battalion forming to counterattack at (M5049) was smashed by the combination of heavy artillery fires followed by strong air bombing and strafing. Throughout the period no less than thirty-three time-on-target concentrations were placed on enemy artillery locations, infantry entrenched and enemy assembly areas. The bridgehead was expanded despite increasingly stern opposition to a depth of three to eight miles over a twelve mile front and 4th Armored Division commenced to pass through the infantry to fan out to the east.

24 March. General regrouping and movement were in progress to conform to changes in Third U.S. Army's boundaries and consequent changes in the various corps boundaries. 10th and 12th Armored Divisions were detached from XX Corps and from Third U.S. Army. 6th Armored Division was assigned to Third U.S. Army and attached to XII Corps. 11th Armored Division was detached from XII Corps and assigned to XX Corps. 89th Infantry Division was detached from VIII Corps and assigned to XII Corps. One light, one medium and one heavy artillery battalion were attached to VIII Corps, the first two having been detached from XX Corps and the last from XII Corps.

25 March. VIII Corps effected crossings of the RHINE RIVER using 76th and 87th Infantry Divisions in the vicinity of RHEINS (L9186) and BOPPARD (L8981). Heavy opposition was encountered initially with a severe enemy artillery reaction consisting of harassing and interdiction fires upon the bridge sites by light and medium antiaircraft guns, mortars and a few artillery pieces. VIII Corps artillery had displaced forward to new positions from which to support the attack and fired extensively in close support as well as continuing its large-scale harassing and interdiction program on enemy road nets and ground installations east of the river. The bridgehead was effectively consolidated and additional crossings were made by 89th Infantry Division in the early morning of 26 March at WILNICH (L9774) and KAUB (M0265). The new crossing encountered heavy fighting with intensive artillery fires upon the crossing sites from antiaircraft guns employed in a ground role.

4th Armored Division advanced to the east with what was fast becoming accustomed rapidity, overrunning the city of DARMSTADT (M6541) and continuing on to the MAIN RIVER where three major bridges were captured intact in the vicinity of HANAU (M9570) and ASCHAFFENBURG (M0154). Enemy efforts at demolition of one of these bridges prior to its capture had been successfully prevented by the use of long-range heavy artillery time fire upon the bridge. 5th Infantry Division cleared HEUSENSTAMM (M4854) and advanced generally north to close upon the MAIN RIVER. Enemy resistance throughout the XII Corps zone returned to its familiar pattern of disorganization and enemy artillery fires were negligible. There was however considerable bombing and strafing of the bridge sites in the zones of 4th Armored and 90th Infantry Divisions by enemy aircraft.

Ammunition expenditures for the week ending at 250600, generally moderate in reflection of the fluid tactical situation in both VIII and XX Corps, continued heavy as XII Corps effected its crossing of the RHINE RIVER. The figures are as follows:-

	VIII Corps	XII Corps	XX Corps
105mm Howitzer	17030	40904	23485
4.5-inch Gun	1965	695	0
155mm Howitzer	4202	12211	4000
155mm Gun	1229	4665	417
155mm Gun (SP)	722	-	442
8-inch Howitzer	1610	2192	940
8-inch Gun	-	-	72
240mm Howitzer	123	-	151

26 March. VIII Corps continued to advance in its bridgehead against moderate opposition with the bulk of both the divisional and Corps artillery displacing to new positions east of the RHINE RIVER. Intensive harassing fires were placed upon the important highways and road junctions, and a total of eighty-two counterbattery missions was fired by artillery with the Corps. Enemy artillery fires were directed almost exclusively upon the bridge sites.

XII Corps encountered stern opposition at SACHSENHAUSEN (M6467) accompanied by heavy but inaccurate enemy artillery fires. 4th Armored Division's bridgehead at HANAU (M9570) was subjected to repeated heavy enemy counterattacks likewise supported by heavy enemy artillery fires. XII Corps Artillery accordingly inaugurated extensive counterbattery fires.

27 March. 6th Armored Division effected a crossing of the MAIN RIVER at FRANKFURT-AM-MAIN (M6769) following which elements of the 5th Infantry Division passed through the armor to engage in strong house-to-house fighting within the city. Small arms and automatic weapons fire was heavy but the defending troops were almost entirely without artillery support. Artillery with XII Corps fired extensively in support of the action and undertook destruction fires upon the telephone exchange and the main power plant at the request of 6th Armored Division. Fighting within the city continued sporadic until all resistance was finally overcome on 29 March.

4th Armored and 90th Infantry Divisions encountered moderate enemy artillery fires on the south flank of XII Corps, coming almost entirely from heavy antiaircraft guns and tanks with the bulk of the fire falling in the vicinity of the bridge sites at (M8668) and (M8566). Artillery with XII Corps fired extensively throughout the Corps zone with considerable emphasis upon counterbattery missions.

28 March. 6th Armored and 5th Infantry Divisions were relieved from assignment to XII Corps and assigned to XX Corps. 11th Armored and 26th Infantry Divisions were relieved from assignment to XX Corps and assigned to XII Corps. No substantial changes in artillery organization occurred as units supporting the relieved divisions took up support of those newly attached.

One field artillery group headquarters, one 155mm Gun (SP) battalion, one 8-inch Gun battalion and one 240mm Howitzer battalion were relieved from XX Corps and placed under the Provost Marshal, Third U.S. Army to assist in guarding and policing the extended lines of communication and to assist in the control and evacuation of the overwhelming number of displaced persons and liberated slave workers within the Army area.

4th and 6th Armored Divisions passed through the bridgeheads over the MAIN RIVER to the north and raced swiftly forward, the former clearing GRUNDBERG (G8621), LAUTERBACH (H1727) and HERSFELD (H3853) and reaching the WERRA RIVER by 31 March while the latter drove north to and effected a crossing of the EDER RIVER southeast of KASSEL (C2004). Resistance to the advances was disorganized, few missions being fired by our accompanying artillery and enemy artillery fires being scattered and sporadic.

VIII Corps pressed forward out of its bridgehead against resistance now disorganized but for a single strong stand by enemy elements west of WIESBADEN (H5665). A sharp fight developed supported by heavy fires delivered by artillery with VIII Corps. Corps artillery was otherwise relatively inactive due to the light character of the opposition, the absence of targets and the proximity of friendly troops. Contact was established with First U.S. Army advancing to the south and WIESBADEN was cleared so that the enemy troops resisting to the west were pocketed and rapidly liquidated on the following day.

30 March. 71st Infantry Division was assigned to Third U.S. Army and attached to III Corps.

Throughout the period. The month was a period of highly fluid action with staggering enemy casualties and tremendous territorial gains that rivalled and even surpassed the great successes of August 1944 in that these most recent drives carried Third U.S. Army from the fringes into the very heart of the enemy's homeland. For the artillery it was a stern test of mobility successfully resolved as all weapons closely followed and leading armor and infantry to render prompt and effective support. It was a period of light to moderate friendly artillery fires in overall volume, of violent fires on the few occasions when needed to smash a determined enemy.

The month saw crossings of the KYLL, MOSELLE, RHINE and MAIN RIVERS. The initial RHINE crossing was effected using speed and surprise and no artillery preparation. Most of the remaining crossings were preceded by severe artillery preparations and in all the assault waves were accorded strong and effective fires in close support as the bridgeheads were effected and consolidated.

Great enemy cities fell to Third U.S. Army, some after little or no resistance, some after severe fighting in which the preparation and close supporting fires of our artillery played a major role. Early in the month our defensive artillery fires had rendered invaluable assistance in breaking up the repeated attempts of a desperate enemy to restore the unhinged defenses of the SIEGFRIED LINE in the lower SAAR basin. Also it was a period of intense harassing and interdiction fires as our artillery lashed the repeatedly enveloped enemy in his frantic search for escape routes.

CHAPTER II
APRIL OPERATIONS

2 April. The 4th Armored Division and the remainder of the VIII Corps artillery continued their advance against scattered enemy resistance. Fires from tanks and self-propelled guns were received in the vicinity of [illegible]. The field artillery group supporting the 4th Armored Division placed fires on several villages and road junctions. Time-on-target concentrations and harassing fires on [illegible] were delivered by [illegible] 155mm howitzers and one [illegible] were fired by the artillery of the 4th Armored Division. In the VIII Corps rapid forward movement precluded effective artillery [illegible] due to slow resupply and maintenance and intelligence which was inconsistent with moving operations along the Fulda River.

3 April. No strong enemy artillery activity was reported during the day as the Army front continued to be quite fluid.

One medium battalion in the II Corps fired a concentration on enemy troops causing the surrender of fifty German soldiers.

The artillery of the VIII Corps was organized for combat as follows:-

[illegible] Corps, consisting of an Infantry Division - one field artillery [illegible] one light and one heavy battalion.

[illegible] Corps, consisting of the 4th Armored Division - one field artillery [illegible] one light and one heavy battalion.

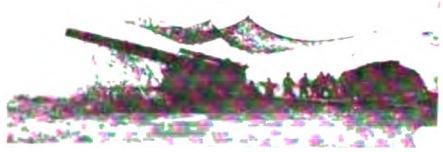
[illegible] Corps, consisting of the 26th Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 1st Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 9th Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 5th Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 2nd Armored Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 8th Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 42nd Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 28th Infantry Division - one field artillery group consisting of one light and one heavy battalion, general support with one medium and one heavy battalion reinforcing [illegible] Corps, consisting of the 3rd Armored

[illegible] was thrown when air [illegible] artillery [illegible] of the [illegible].

10 April. The 49th Infantry Division received considerable artillery fire. A total of [illegible] were fired in the area of the 49th infantry division. [illegible] and other fires on enemy troop concentrations, [illegible] property and [illegible]. [illegible] were fired by the 49th artillery [illegible] in the [illegible] area. [illegible] and interdiction missions were fired by XIII [illegible] artillery units.

11 April. Enemy artillery fire was light and scattered and again was principally from [illegible] weapons. [illegible] of XIII [illegible] artillery [illegible] of the 49th Division Artillery [illegible]. The 49th [illegible] division artillery [illegible] in the XIII [illegible] area [illegible] a [illegible] on the [illegible] [illegible] of enemy troops [illegible] in their [illegible] fire on the [illegible] [illegible] on the enemy for a [illegible].

Air [illegible] of XIII [illegible] were white. Some light anti-aircraft fire was observed during the [illegible] but [illegible] [illegible] was [illegible] [illegible] [illegible] of fire missions [illegible] normal [illegible] of fire, [illegible] reconnaissance, [illegible], and [illegible] missions.



12 April. Light enemy artillery fires were received by XIII Corps units. Counter-battery fire was [illegible] in the 49th Infantry Division area in the vicinity of [illegible].

VIII Corps troops attacked east in the vicinity of [illegible] and [illegible] [illegible] [illegible] [illegible] the advance met a determined artillery fire of [illegible] and [illegible] artillery. XIII [illegible] artillery [illegible] the advance [illegible] the east [illegible] light scattered enemy [illegible] fire.

13 April. Throughout the XIII Armored Division, [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] fires [illegible] [illegible] artillery fires [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]

22/600) April as the fluid tactical situation continued. The expenditures were as follows -

	VIII Corps	XII Corps	XX Corps
155mm Howitzer	6474	7154	4872
4.5-inch Gun		146	124
155mm Howitzer	4147	2014	1[illegible]
155mm Gun	2[illegible]	749	477
155mm Gun (GP)	721	-	-
8-inch Howitzer	533	174	882

23 April. III Corps artillery units initiated route reconnaissance preliminary to movement to forward assembly areas. With one exception, which was received from assignment to [illegible] Third U.S. Army, 14th Armored Division was assigned to First U.S. Army and III Corps.

Artillery of the XI corps was organized for combat as follows:

General support, reinforcing 26th Infantry Division - one 155 mm artillery group consisting of one battalion of 155 mm guns and one medium battalion.
General support, reinforcing 78th Infantry Division - one field artillery group consisting of one medium and two heavy battalions.
General support - one field artillery group consisting of one medium and two heavy battalions.
General support, reinforcing 13th Armored Division when committed - one field artillery group consisting of five medium battalions.

24 April. III Corps artillery units began to go into forward assembly areas as did most artillery units of the XI Corps.

Artillery battalions of the 69th and 78th Infantry Divisions were active in firing harassing and interdiction missions. Several groups of enemy troops were dispersed, and one ammunition dump was destroyed.

One field artillery group of III Corps consisting of one medium and one heavy battalion was attached to 13th Armored Division.

25 April. No activity was reported in the III Corps zone and little activity of consequence in the XI Corps zone as artillery battalions continued their displacements forward into positions. In the XII Corps zone the 97th Infantry Division attacked with artillery support being furnished by divisional and supporting corps artillery units. The 26th Infantry Division artillery fired on ferries, antiaircraft guns, vehicles and personnel along the [illegible] River.

26 April. III Corps artillery units continued displacement and preparation of positions in support of corps operations. The 97th Infantry Division Artillery supported an attack on [illegible] with a thirty-minute preparation.

27 April. With the Army front generally along the [illegible] River line the enemy took advantage of the [illegible] which afforded this obstacle to increase his artillery activity. Self-propelled weapons and some field artillery pieces of light caliber harassed the river line towns, particularly [illegible]. The field artillery observation battalion with the III Corps secured thirteen sound locations of which all but two were single guns and all of light caliber. III Corps units overran ninety field artillery pieces of 155mm caliber, and twenty-one guns of 270mm caliber were found at [illegible].

III Corps artillery units retained under Corps control were organized for combat as follows:-

General support - one field artillery group consisting of one heavy battalion.

General support, reinforcing 26th Infantry Division - one field artillery group consisting of one heavy battalion.
General support, reinforcing 69th Infantry Division - one field artillery group consisting of two heavy battalions.

One medium artillery battalion, reinforcing the 69th Infantry Division in the XII Corps zone fired time-on-target concentrations on [illegible] road, [illegible] and [illegible] in order to neutralize a three-gun enemy battery. The 81st Infantry Division artillery fired smoke concentrations in preparation for the crossing of the [illegible] River, then fired harassing missions on road junctions in towns in the smoke screen. Artillery with III Corps effectively fired on targets being used by the enemy to withdraw his troops across the [illegible] River.

28 April. Counter-battery artillery fire was employed along the army front particularly in the zones of the 11th Armored Division and 26th and 69th Infantry Divisions. Resistance was not strong and all units made good progress.

One medium artillery battalion was relieved from attachment to III Corps and assigned to duty with the Provost Marshal, Third U.S. Army.

29 April. Six groups of time fires were fired in support of the 69th Infantry Division attack on the [illegible] airfield. Some of these groups of concentrations were set up on call and were fired as the situation warranted. Counter-battery fire by artillery fired on the 81st Infantry Division area affected the siting of the [illegible] River. One battalion of the 81st Infantry Division artillery fired a fifteen-minute preparation prior to the attack on [illegible] and repulsed an attack by enemy tanks and infantry. One division started assembling in the vicinity of [illegible].

Artillery ammunition expenditures for the week ending 29/24 April showed a very slight increase as Third U.S. Army started to [illegible] the [illegible] Border. The expenditures were as follows -

	III Corps	XII Corps	XX Corps
155mm Howitzer	1443	1354	11649
4.5-inch Gun	121	144	474
155mm Howitzer	414	41	4411
155mm Gun	248	474	2[illegible]
8-inch Howitzer	74	491	882

30 April. A preparation for the 13th Armored Division's assault across the [illegible] River was fired by one medium Corps artillery battalion. One divisional artillery battalion of the 13th Armored Division fired 1,892 rounds during the day in preparation for the same river crossing operation. 86th Infantry Division Artillery fired sixty-eight missions during the day, expending 1,549 rounds of ammunition.

One heavy battalion of the III Corps was placed on line of communication duty within the Corps. One medium battalion was relieved from attachment to XX Corps and attached to Third U.S. Army for line of communication duty. One medium battalion was relieved from attachment to XX Corps and placed on duty with the Provost Marshal, Third U.S. Army.

The War at the Front. The month of April was characterized by the rapid disintegration of German resistance. Our artillery units followed

close behind infantry and armored forces as they swept north to KASSEL [illegible] and east to the [illegible] and the CZECHOSLOVAKIAN border. Action was heavy in certain areas, such as [illegible] and in many other towns. Artillery played a short but effective role in forcing surrenders. Since resistance frequently developed in the vicinity of towns our divisions soon developed techniques of combining convincing bombardments with propaganda leaflets giving surrender instructions to town burgomeisters. Initially the division wrote their own leaflets and distributed them over the enemy by artillery shells or by liaison aircraft. Later in the month standard leaflets were made available to all units.

The shift in the direction of attack together with the transfer of one corps to First U.S. Army and the movement of another corps from the [illegible] to Third U.S. Army required a redistribution of artillery units. As the Army moved rapidly south to [illegible] both corps and divisional artillery battalions demonstrated their ability to move rapidly over great distances and be in position to fire upon and destroy enemy opposition wherever it appeared.

CHAPTER 12
MAY OPERATIONS

Artillery action in the month of May 1945 was characterized by pursuit operations similar to those of April. Control of artillery units was decentralized and most corps artillery units were employed in reinforcing the fires of divisions. Artillery was used to crush resistance in certain towns and cities, to fire preparations for river crossings, to break up small-scale counterattacks, and to prepare the way for the smash through the thin line along the CZECHOSLOVAKIAN border in the drive on PILSEN.

As the month progressed, more and more units were shifted to missions such as security guard for lines of communications and processing Prisoners of War. By 08/2400 May, twenty-five battalions and group headquarters had been assigned such missions by the Army and corps.

1 May. In the III and XX Corps zones divisional and corps artillery units supported operations in the crossing of the [illegible] RIVER. The III Corps Artillery placed a heavy battalion on line of communication duty and XX Corps Artillery changed the mission of one group with two heavy battalions to general support, reinforcing the 65th Infantry Divi-

Digitized by Google

[illegible] in preparation for night crossing operations. On the left flank of the Army, the [illegible] Infantry Division [illegible] against heavy resistance and [illegible] the Army to reach its objectives. Division Artillery fired missions [illegible] On the extreme [illegible] the [illegible] Armored Division [illegible] to the XII Corps. The [illegible] Armored Division [illegible] with [illegible] and a medium battalion [illegible] a battery within nearly [illegible] until our troops entered the town.

4 May. In the Austrian Tirol, the Army [illegible] artillery activity as the 14th Armored Division [illegible] Infantry Division, advanced [illegible] XII Corps artillery [illegible] the Division [illegible] the 103d Infantry Division, [illegible] Armored Division [illegible] 88's [illegible] and wrecking [illegible] vehicles.

In the left flank [illegible] the Army, a small [illegible] consisting of one tank, two [illegible] and [illegible] was [illegible] Infantry Division [illegible] of [illegible]. The attack was [illegible] artillery fire and [illegible] observed missions were fired on [illegible] and [illegible] tanks.

5 May. Two battalions of III Corps artillery were shifted to occupational [illegible] duties. [illegible] battalions were also relieved, following the [illegible] of the [illegible] Division artillery [illegible] by XX Corps units [illegible]. Artillery in support of crossings of the [illegible] while engaged in operations in Austria [illegible] continued to draw enemy fire. Two [illegible] were destroyed as resistance in the town collapsed.

In the III Corps zone, units of one field artillery group supporting the easternmost attack of Combat Command A, 11th Armored Division, situated on a hill at [illegible], were [illegible] five times by [illegible] but our forces [illegible] in [illegible]. The enemy continued [illegible] shelling.

When the 86th Infantry Division was transferred from III Corps to Seventh U.S. Army, one light and one medium artillery battalion which had been reinforcing the fires of the Division remained with the Corps.

6 May. The III Corps, having reached the objectives, split its artillery in place [illegible] maintenance duties and preparation [illegible] the artillery to occupational responsibilities. One field artillery group of XX Corps fired [illegible] targets in support of the 11th Armored Division, destroying [illegible] and [illegible] an enemy column [illegible] by halt). Another group of XX Corps artillery moved its three heavy battalions to assembly areas and released its trucks to [illegible] the infantry of the 103d Infantry Division. Harassing and interdiction fires were fired on the left flank of the Army.

Minor adjustments were made in the organization for combat and missions of XII Corps artillery units as shown below in anticipation of the commitment of the 14th Armored Division.

General [illegible] 14th Armored Division when committed - one [illegible] artillery [illegible] battalions of light and one medium battalions. General support [illegible] Infantry [illegible] and one [illegible] artillery group [illegible] one field artillery group [illegible]

[illegible] light, one [illegible] and one heavy battalion.

General [illegible] Infantry Division with [illegible] and one medium battalion [illegible] artillery [illegible] battalions.

[illegible] fire [illegible] the [illegible] Infantry and [illegible] battalions.

The V Corps artillery headquarters and headquarters Battery, V Corps Artillery were assigned [illegible] Army and prepared to attack eastward.

5 May. Corps artillery units of XII Corps were [illegible] in order [illegible] the [illegible] Infantry Division, [illegible] Armored Division [illegible] Infantry Division [illegible] artillery [illegible] XII Corps artillery [illegible] the Division [illegible] the 103d Infantry Division, [illegible] Armored Division [illegible] 88's [illegible] and wrecking [illegible] vehicles.

In the 86th Infantry Division sector, reorganizations were being com-

pleted for the surrender of the entire 12th Panzer Division, while in the zones of the 14th Armored Division Infantry Divisions hostile artillery activity increased. Attacks [illegible] objective fires and [illegible] were [illegible] active [illegible] the vicinity of [illegible] counter-[illegible] fires were [illegible] of [illegible] and other [illegible] and interdiction fires were placed on [illegible] and [illegible] by [illegible] one field artillery [illegible], supporting the attack of Combat Command A, 14th Armored Division.

6 May. The III Corps Artillery continued reorganization of its [illegible] and [illegible] artillery units of XII Corps were relieved [illegible] at Oetzal Bay to provide an additional 110 trucks for motorization of infantry units.

Aggressive action continued in the zones of the XII and V Corps but artillery fires were relatively light. Two combat [illegible] of the 14th Armored Division crossed [illegible] assembly areas to pass through elements of the 86th and 44th Infantry Divisions and one field artillery group took up its [illegible] mission. In the 86th Infantry Division sector artillery prisoners of war disclosed that they had been employed as infantry but stated that they had no knowledge of any hostile artillery in the Division sector. The activities of Czechoslovakian patriots made necessary some restraint in the firing of our [illegible] pieces except where hostile activity was observed. In the V Corps zone organic artillery of the 1st and 97th Infantry Divisions fired fifty-three missions to support the attack toward [illegible]. Practically no fires were necessary on the part of the 42d Infantry Division Artillery and the 106th Armored Group Artillery, while the 7th Armored Division Artillery units were in an assembly area.

In its organization for combat in this operation, the V Corps Artillery had decentralized control of its battalions in anticipation of rapid movement. The main effort was made by the 97th Infantry Division to which was attached one field artillery group with an observation battery, one medium battalion and one battalion of 155mm Guns (self-propelled). On Corps order, the 106th Armored Division passed through the 97th Infantry Division, taking with it one battery of the 155mm self-propelled battalion. On the north, one artillery group of one medium, one light and one 155mm gun battalion was attached to the 1st Infantry Division which was also supported by Combat Command A of the 7th Armored Division. South of the main effort, the 42d Infantry Division Artillery was reinforced by the attachment of one field artillery group with two medium and one 155mm gun battalion. One armored field artillery battalion had been attached to the 102d Cavalry Group which was operating rear areas in reserve and the remainder of Corps artillery, a group headquarters and an 8-inch Howitzer battalion were on security guard.

Ammunition expenditures for the week ending 060800 May were relatively light, but they reflected the short preparations fired to protect river crossings and the early employment of light and medium artillery together with a few volleys of 8-inch howitzer that [illegible] all resistance. The figures are as follows:-

	III Corps	V Corps	XII Corps	XX Corps
105mm Howitzer	657	12,277	1,902	102
[illegible] Gun	0	-	0	-
155mm Howitzer	347	2,744	618	505
4.5 Gun	160	193	1,526	258
155mm [illegible]	-	612	-	-
8-inch Howitzer	36	148	66	148

7 May. The organic artillery of the 71st and 80th Infantry Divisions [illegible] forward to provide close support but only two artillery missions were requested. Only three artillery missions exceeding 50 rounds were fired by the 1st Infantry Division Artillery in the III Corps zone as the enemy continued mass surrenders. In the XII Corps zone, the 14th Armored Division advanced to its objective against light resistance from dismounted troops and artillery fires decreased accordingly.

8 May. The only artillery activity in the Army was the firing on hostile tanks and infantry by the 76th Infantry Division Artillery.

In the III Corps zone artillery had been redisposed for occupational duties while the artillery of the XII and V Corps remained in firing positions and assisted the divisions in receiving prisoners of war.

The collapse of German resistance just prior to the actual cessation of hostilities and the severe restrictions on our troops from further advances resulted in extremely light ammunition expenditures for the

Digitized by Google

last ten days of the campaign. The figures are as follows:

	HE Rounds	WP Rounds	HE Losses*	WP Losses*
105mm Howitzer	0	450	0&3	1&3
4.5-inch Gun	-	-	-	-
155mm Howitzer	0	40	0	0
155mm Gun	0	0	-	-
155mm Gun (SP	-	0	-	-
8-inch Howitzer	0	0	2&	0

Throughout the period. In this last eight days of the attack on GERMANY and her German allies, a powerful western army advanced at any point it desired, cutting deep into a numerically strong but morally disorganized enemy. Air spit fires from strong fast tank columns by air destruction or surrender to local strongpoints. Where rivers had been or towns were strongly defended, sufficient artillery was immediately available to blast out resistance or to host river crossings. This demonstrating of power and mobility in our heavy, more even after a drive across GERMANY, broke any remaining will to resist. As the enemy became more disorganized and his units smaller and more isolated, an increase in number of artillery units to 1/4 a squadron passing lines of communication while their trucks carried on carrying the new supplies. [illegible] field artillery battalions and [illegible] artillery [illegible] artillery with Third U.S. Army, [illegible] over the battalions and three groups were performing duties other than their primary mission.

ARTILLERY TO THE RHINE

The Third U.S. Army became operational with [illegible] field artillery pieces of 105mm caliber or larger excluding tank destroyers, anti-aircraft artillery, and infantry weapons. In the course of the campaign the number fluctuated from a low of 324 pieces on one occasion to 1,044, at the end of hostilities. From the start of the campaign, [illegible] rounds of ammunition which [illegible] tons were fired at the enemy. In addition, approximately [illegible] rounds of captured artillery ammunition were fired from eighty-seven captured weapons of which [illegible] were fired from 15 August to 8 May [illegible] there were wide variations in artillery ammunition expenditures, [illegible] 105 mm howitzers [illegible] operations necessitated the issue of [illegible] per gun per day, while [illegible] 7 November, when the supply of ammunition to the Army was substantially reduced, expenditures [illegible] 105 mm howitzers [illegible] compared with the [illegible] rounds available. The average daily [illegible] at the height of the [illegible] action. It was [illegible] artillery ammunition [illegible] tons, at 420,000 rounds during the week of 31 December - 7 January.

During 231 days of continuous operations, artillery batteries have been called upon every emergency of the campaign. They have demonstrated their superiority over German artillery in both static warfare and have shown their ability to keep pace with infantry under all sorts of terrain and weather conditions. Our guns and weapons have fired on targets which include everything in the German Army and even boats and barges of the German Navy. Every type fire was used and every means of observation exploited. The [illegible] time-on-target fire of seven battalions proved effective in destroying enemy artillery, [illegible] the way for infantry and armor [illegible] their objectives in a town. The [illegible] counter-preparation fire, massive artillery concentrations [illegible] fire in close support of infantry and armor [illegible] breakthrough.

Artillery units with Third U.S. Army demonstrated not only their ability to move their personnel and fire power, but also to maintain communications under even the most adverse conditions. Artillerymen were cross-trained and given [illegible] so that they could perform [illegible] service. The [illegible] artillery units were frequently [illegible] of enemy wire during the advance. The extremely wide frontage of the fall and winter warfare [illegible] artillery [illegible] the Army's rapid advances through FRANCE and GERMANY, [illegible] due in large part to their role in providing communications for speedy fire missions.

The Air OPs in the course of the campaign have proven an auxiliary to the primary mission of artillery observation and have been a vital factor in the high [illegible] of American artillery. The Thirties seventy-seven of these planes were flown from England to France with [illegible] and since the beginning of operations [illegible] have been flown. Of these many thousands were missions for the adjustment of fire on area, [illegible] while [illegible] were reconnaissance and patrol flights along the front lines or in enemy territory. In the conduct of our tremendous fire [illegible] artillery intelligence, the Air OPs have been particularly effective. The very [illegible] artillery aircraft has often been sufficient to silence enemy batteries. Artillery aircraft have been used to spot [illegible] infantry units, for reconnaissance [illegible] of enemy-held terrain and in pursuit operations have proved as observation at the head of armored and infantry columns.

Enemy countermeasures against the Air OPs have not been consistently effective. With extensive air-craft, artillery air-strips, antiaircraft and small arms fire, the enemy has destroyed less than one Air OP for every thousand hours of operation. The necessity of operating from small and unsuitable fields, of carrying observation and maintaining patrols in all weather, and--for the major part of the campaign--the lack of proper aviation fuel have added to the hazards of Air OP operations. The work of the 42d Mobile Reclamation and Repair Squadron in the maintenance and repair of aircraft and the procurement of Air Force supplies has contributed materially to the success of the Air OPs.

At the close of operations, 280 aircraft and 340 pilots, the largest number of Air OPs under the control of one army in the theater, were operating with Third U.S. Army artillery units. All units were at full strength in pilots and in aircraft, with surplus pilots attached to many divisional groups and a small reserve of aircraft under Army control.

The German Army employed nearly every artillery weapon in Europe and air and water assault equipment types were found in Third U.S. Army, from light calibers ranging from 75mm to 240mm. While the commonly known weapons were not used extensively in our area, a new weapon of heavy artillery caliber was used to remain the city of LUXEMBOURG and con-

ventional railroad artillery struck communication centers along the entire front. One minor railroad gun, which probably had never been fired, was found with a tube between 100 - 150 feet long and a 31-inch bore. In spite of these resources, our artillery has maintained ascendency over the hostile artillery at all times, even including the effective fortifications at BREST, in the defense of METZ and the SAAR RIVER during the fall of 194[illegible] and in the Germno offensive of December towards BASTOGNE. Our ordnance units have counted 3,906 destroyed or captured guns of 75mm caliber or greater from 1 August 1944 to 8 May 1945.

The tactical employment of German artillery was considerably hampered by the operations of our Air Force and our effective counter-battery artillery fires. Complete artillery regiments became fewer and fewer after the battle of Northern France and mixed weapons appeared in battalions and even in batteries. Our Air Force presented the Germans with difficult supply problems which caused apparent ammunition shortages at the gun positions together with increasingly frequent improvisations in weapons and organization which made their artillery less and less effective. The Volks Artillery Corps appeared and disappeared in five months and after the crossing of the RHINE, tanks, self-propelled guns, antitank and antiaircraft weapons supplied the bulk of the enemy's artillery resistance.

The German artillery intelligence network was broken. Pieces but managed to reform between the SAAR and the RHINE. Their ground observation facilities were good and their field artillery observation battalions were as highly organized as our own. At one time it is known that there were three observation battalions and two observation batteries operating on the Third U.S. Army front. The enemy's estimates of our artillery were as valiant in certain stabilized phases of the campaign, yet they were unwilling to fire sufficient ammunition on any but the most urgent front line targets.

The German lack of air observation, the complete breakdown of their communications under the weight of our preparation fires, their unwillingness to spend ammunition, their reliance on the self-propelled and other high velocity guns and the ineffectiveness of their harassing fires by long-range heavy weapons proved to be the undoing of their artillery. Our artillery intelligence net, Air OPs and our speedy concentration of fire [illegible], neutralized or destroyed the enemy weapons in action and freed our weapons for missions directly supporting our infantry and armor.

CHAPTER 13
LESSONS LEARNED & CONCLUSIONS

[redacted]

1. General. During the campaign in Europe it has been reaffirmed that a [illegible] search must be made to locate artillery positions, personnel, arms, command posts and lines of communication. Agencies that have proven of value for this purpose are as follows:

Photo Interpretation
Field artillery observation battalions
Artillery Air OPs
Sound ranging
Artillery photos
Prisoners of War interrogation teams
Military Intelligence interrogation teams
Aerial artillery teams
Intelligence gathered from all aerial sources

Close cooperation and frequent liaison between artillery units and [illegible] agencies are essential if complete and reliable artillery and artillery [illegible] information is to be obtained.

2. [redacted] Experience has proven that the [illegible] problem is an [illegible] one. A [illegible] search for [illegible] and artillery units must be made [illegible] ways to be [illegible]. The [illegible] search for [illegible] artillery [illegible] way, [illegible] to the [illegible].

3. [redacted] [illegible] groups

[illegible]

4. [redacted] [illegible]

5. [redacted] [illegible]

6. [redacted] [illegible]

7. [redacted] [illegible]

8. [redacted] [illegible] means of [illegible] headquarters.

9. [redacted] [illegible] general [illegible] [illegible] [illegible]

the ammunition problem. Since there are so few 4.5-inch gun battalions, they cause unnecessary complication. Actually, 155mm or 8-inch howitzer battalions would have been more effective and it is felt that there is no real place for the 4.5-inch weapon in our artillery as constituted.

20. Time Fire on Bridges. The employment of time fire or Pozit ammunition to cover the approach to bridges in many cases proved a means of capturing bridges intact. The intention of the enemy to blow a bridge at the last moment was nullified by taking the bridge under fire in such manner ten to fifteen minutes before the arrival of the tanks. Damage to the bridges was negligible and the enemy was prevented from placing demolitions or setting off some already placed and friendly tanks were able to approach the bridge site, cross the bridge and secure it against further enemy ground action.

21. Artillery Support for Armor. When the deepest armored thrusts can have immediate light and medium artillery support from corps. Each armored division was normally reinforced by an artillery group consisting of one light self-propelled battalion and two medium battalions which were placed under operational control of the division. With the divisional artillery this permitted placing two light self-propelled and one medium battalion in support of each combat command. As the artillery group was not attached to the division, admin strative and supply problems were not added to the division's burdens.

In the light of experiences of the campaign it is highly desirable to have a battalion of 155mm howitzers (self-propelled) as an organic part of an armored division. Tractor-drawn howitzers rendered very good support and a self-propelled unit of similar characteristics should improve this.

22. Corps Artillery Support of Mobile Operations. Heavy artillery--usually two battalions--was pushed forward behind the armor as rapidly as possible. Often a corps fire direction center accompanied these units, thus providing additional fire support for the armored thrusts within a few hours. One battalion of 155mm gun (self-propelled) per corps should be available for any necessary use. These weapons are particularly useful in attack of fortified positions. One battalion of 8-inch guns within an army of three corps is desirable. The additional range of such a weapon is useful in many cases for particular targets such as enemy railroad guns and distant towns and bridges. The mobility and accuracy of this weapon leave much to be desired.

23. Use of Field Artillery Observation Battalions. When more than one observation battalion per corps was available, the extra one was split between the two or more corps having the widest area. Theoretically, observation battalions operate far short of the desirable theory in most of the operations. Particularly in the fast moving armored units did the observation battalions see little employment. First priority must be given to the development of a more effective means of locating hostile batteries and mortars than is now provided by sound locators. Radar offers the best possibilities.

24. Present Methods and Training are Sound. The superior performance of artillery units was adequate proof of the efficiency of our artillery training and methods and the adequacy of our equipment and organization. Improvement in effect can be obtained by more emphasis in development of methods of, and training in, the attack of various types of targets and the surveillance of fire for effect on all targets. This is the weakest phase in artillery conduct of fire.

25. Adjustment by High Performance Aircraft. Efficient utilization of the fire power of long-range artillery requires that high performance aircraft be made available for its adjustment. Experience has shown that the procedure for obtaining and conducting Arty A missions must be prescribed and carefully followed. This procedure should be prescribed by the highest level in the theater to assure uniformity when units are transferred from one army to another. The automatic daily allotment of several Arty A missions to each corps is desirable to facilitate planning. Impromptu missions in excess of the automatic missions should be available. The method outlined in Operations Memorandum Number 4, Headquarters Third U.S.Army, dated 25 April 1945, have stood the test of combat. (See Annex 5)

26. Communications. Uniformity of codes and ciphers throughout the artillery with the army is necessary in order to facilitate handling of radio and telephone traffic between artillery headquarters and to make easier the rapid establishment of communications in the case of units changing attachment. In order to secure this uniformity, distribution from army level should be established for the following Signal Operations Instructions items to the level indicated for each:

Down to and including all field artillery battalions:

Radio call signs.
Telephone directory names and unit code group designations.

Artillery Blinds.
Artillery radio authentication code (Playfair method).
Map coordinate code (Playfair method).
M-209 converter.

Down to and including division artillery headquarters and corps field artillery battalions:

Frequency assignment lists.
Miscellaneous items such as pyrotechnic code, panels, daylight and darkness charts, etc.

The army artillery section should cooperate with the army signal section in preparing radio call signs and is responsible for the distribution of items named above.

The Army Artillery Officer's Radio Net is necessary for the transmission of photo interpretation data between corps artillery and the army photo center, the exchange of intelligence and operations data between adjacent corps and up to army headquarters, for special liaison, and for coordination of Arty A missions. The equipment should consist of one SCR-193 at each corps artillery fire direction center, one SCR-399 at army photo center, one SCR-399 at army headquarters as Net Control Station.

SUPPLY

27. Ammunition Requirements. Recommendations for operational ammunition requirements were submitted but actual delivery in quantity and types of ammunition did not approach the planned requirements. Delivery of adequate ammunition of the proper type at the right time must be insured prior to an operation. It is too late to correct errors after the operation begins.

28. Segregation of Ammunition Lots. During the first months of the operation segregation of ammunition by lot number was entirely unsatisfactory. This condition existed at the ports and reserves, at Army ammunition supply points and depots and in unit trains. Every agency from factory to the artillery battery must be thoroughly conscious of the necessity of keeping ammunition lots segregated and furnishing ammunition of uniform lot numbers.

29. Balance of Supply Rates. Experience in this and other theaters of operations has proven that original War Department maintenance supply rates for ammunition were not properly balanced by quantity and type. The proportion of ammunition by type furnished a theater should approach the following:

Weapon	Rds per tube per day	Proportion of types	Proportion of types of fuses
Gun, 4.5-inch, Field	28	95% HE	40% M51A3 6% M55 45% M67 2% T105
		5% WP	
Charge, propelling, 4.5-inch gun		60% SC 40% RC	
Gun, 155mm, self-propelled M12A1-10 and Field, M1	25	93% HE	67% M51A3 8% M55 5% M67 10% T105
		2% HC 5% WP	
Gun, 8-inch, Field	10	100% HE	95% M51A3 5% M67 15% T105
Charge, propelling, 8-inch gun		35% SR 65% WP	
Howitzer, 105mm, M2A1, Field and self-propelled	45	84% HE	75% M51A3, M5 25% M55
		7.0% WP 2.0% HC 1.4% Cld 0.2% TRAC	
Howitzer, 155mm, M1, Field	33	91% HE	80% M51A3 15% M55 5% M67 15% T105
		6% WP 2% HC 1% Clc	
Charge, propelling, 155mm howitzer, M1		40% M,A1 10% WP	
Howitzer, 8-inch, field	25	100% HE	45% M51A3 5% M67 10% M55 10% T105
Charge, propelling, 8-inch howitzer		75% WP 25% SR	
Howitzer, 240mm, M1, field	15	100% HE	65% M1A3 5% M67 20% T105

30. Basic Load Charts. Type and tonnage of ammunition vehicles varied widely between units. This and special operational requirements made impracticable the rigid adherence to published basic load charts. Nevertheless, basic load charts are necessary in counting an operation and for new units arriving in the theater during the operation. Authority to depart from basic loads as the operation dictates should be delegated to corps and division commanders.

31. Coordination with Army Finance. Since corps artillery commanders frequently called upon the Army Artillery Officer for data on availability of quantity and type of ammunition in Army supply points, it was necessary that a daily report of stockages in army ammunition supply points, depots and railheads be given the Army Artillery Officer by the Army Ammunition Officer.

Target levels of ammunition for each corps are planned by the Army Ordnance Officer so as to provide adequate quantity and type of each caliber and still make economic use of oversized transportation facilities. He must have timely information on artillery organization for combat.

32. Ammunition Reports. Ammunition expenditure reports are necessary to the Artillery Officer and the Ordnance Officer as a basis for operational planning and it was found that such reports must be made by corps daily and weekly.

Digitized by Google

DECLASSIFIED

33. Availability of Ammunition. Ammunition availability vitally affects operations. At one stage of the campaign offensive operations were completely stopped for four weeks because of an ammunition pipeline suddenly depleted with all artillery virtually silent. Supervision of ammunition expenditure is necessary when ammunition supply is not plentiful. Corps artillery commanders are entitled to know the ammunition availability picture even though ammunition is not actually rationed.

The ammunition allocation system was never followed in Third U.S. Army. At certain critical periods it was found that some supervision was necessary but only on a round-per-gun-per-day basis based on actual and forecast availability. Allotment of ammunition should be made to the several corps on a round-per-gun-per-day basis as the difference in mission between one corps and another is usually provided for by the artillery allocated to each corps.

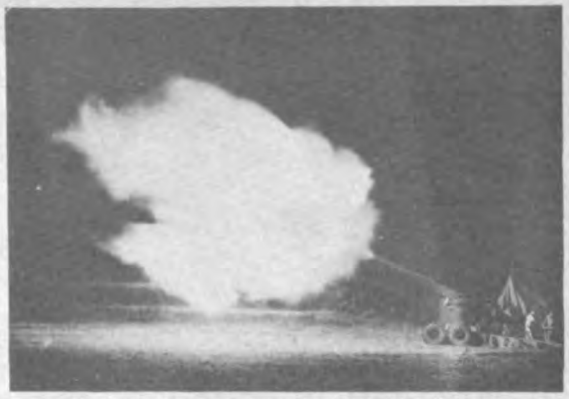
34. Vehicles for Ammunition. Tractors and trailers are not practicable for ammunition resupply. Trucks are most desirable for this purpose because they are most easily supplied and maintained and because they perform satisfactorily under difficult conditions of weather and terrain. Field artillery battalions should be issued trucks in sufficient tonnage to provide for ammunition resupply without using trailers.

Ammunition frames are not practicable since they reduce the ammunition basic load. They should be eliminated from tables of equipment.

35. Posit Fuze. From 1 January 1945 to 18 March 1945, artillery with Third U.S. Army expended 175,114 rounds of cannister ammunition, Posit fused. This represents 7.5% of the total expenditure of all types of howitzer ammunition. The greatest deterrent to the use of Posit fuzes in daylight has been the danger to friendly artillery liaison planes. Availability of projectiles and fuzes would have permitted greater expenditures. With the longer delay element incorporated in the fuze, expenditure of Posit fused ammunition will no doubt exceed 10% of all expenditures.

36. Anti-concussion Device. An anti-concussion device for the protection of cannoneers' ears in gun units was found to be very beneficial. The device developed in Third U.S. Army was an individually constructed acrylin ear plug and was processed under the direction of the dental service. More than 1,700 pairs of these plugs were fitted and used prior to 1 May 1945. The device practically eliminates the concussion effect and fatigue was greatly reduced when the device was worn. Hearing is not impaired. The telephone can be used and normal conversations carried on. Speed of firing was increased by the use of this device. This device should be produced in quantity for issue to all field artillery gun battalions.

AIR OP



37. Equipping and Planning. Aircraft and other Army Air Force table of organization and equipment items, and first and second echelon maintenance parts and supplies must be issued to units in order of established priority and records kept showing status of major items of equipment for each unit. If Army Air Force equipment is not unit loaded, but is pre-shipped, it should be in complete pack-ups, which may be called "projects". Projects should be complete upon issue, however some will not be. Requisitions made by units direct to Air Force depots lead to duplication of issue, mistakes and confusion, and no centralized follow-up may be had. A controlled initial issue requisitioning procedure must be established so that all requisitions are processed through the Army Artillery Air Officer, who must provide coordination, control, and follow-up.

Depending upon the type operation contemplated certain special equipment may be necessary. For instance, it was necessary to procure and distribute pyrotechnic pistols, life preservers, one-man life rafts and auxiliary fuel tanks to each aircraft flying across the Channel. It was not necessary to procure one per aircraft as this equipment was turned in immediately upon arrival on the Continent, transported back to the United Kingdom and re-issued. Such equipment must be procured either through normal or special supply channels or manufactured locally and procurement action initiated as early as possible as unforeseen delays always develop.

38. Special Training. During the equipping period and during all staging, flight training must be emphasized with special attention given to procedures dictated by the forthcoming operation. In the flight across the Channel it was necessary for all pilots to be able to follow the simple procedure of holding a steady compass course for a relatively long period of time over water. To this end all units had cross-country flight training; some made practice over-water flights. A prime requisite for all such flights is a properly compensated compass and an accurate deviation card in each aircraft. Special emphasis was given these items in the staging period.

39. Liaison with Air Force Supply Agencies. Frequent personal checks by the Army Artillery Air Officer should be made to insure that the proper supply levels and pack-ups are being accumulated and cared for. The Army Artillery Air Officer must do all in his power to establish the existence of the army, its requirements and its problems to the proper Air Force personnel. After this lesson was learned, Air Force supply to this command improved greatly. Definite plans must be established through channels in writing with the proper Air Force agencies well in advance of the operation for continued resupply of parts, equipment and supplies.

40. Corps Artillery Supervision. Corps Artillery Air Officers should be required to exercise general supervision over operations of subordinate units. Such supervision will provide more efficient control of Air OPs and enhance a generally standardized operating procedure. Much can be accomplished in this manner toward helping the weaker air sections and pilots toward a higher standard. Groups and divisions are the front line operating sections and the Corps Artillery Air Officer should work to keep all sections abreast of the latest technical advancements and refinements and to provide a link between the Army Artillery Air Officer and lower units' Artillery Air Officers to aid the flow of administrative information, replacement, maintenance requirements, etc.

41. Records. Complete records covering personnel and aircraft of all units in the army must be kept by the Army Artillery Section. Assignment, transfer and reinforcement of pilot personnel must be expedited and recommendations pertaining thereto must be immediately available in order to keep units up to strength 100% of the time. Record of dates of pilots' physical examinations must be complete, otherwise long lapses in required examinations will become prevalent. Individual pilot time must be recorded for general statistical purposes and for planning fatigue reinforcement requirements. Individual aircraft records must be kept showing total time of, major repairs to, each assignment of and each individual marking on, and final disposition of each aircraft of the command. This information is necessary to efficient assignment and replacement of aircraft made necessary by operational losses and fatigued or "war weary" aircraft, and for planning for future requirements.

42. Operations and Status Reports. Operational and status reports should be submitted monthly by each division artillery headquarters covering all division artillery air sections and by each corps artillery group and field artillery battalion headquarters covering its own organic air sections only. If headquarters higher than battalions submit operational and status reports covering assigned and attached corps artillery battalions, all battalions are not reported due to the constant shifting of these units among higher headquarters. Each corps artillery unit must be responsible for its own reports. These reports should show pilot, mechanic, and observer personnel; individual pilot time; aircraft and individual aircraft time, markings and condition; operational missions by type and number flown; developments, special problems and new operational procedures. Statistics compiled from these reports are essential to future planning.

Because of the fact that the Aircraft Accident Report, War Department Army Air Force Form 18, does not record all information necessary for the specialized Air OP type of operation, a form was devised and entitled "Air OP Loss Report". This form is designed to reduce paper work and to expedite replacements, and at the same time furnish the necessary information for classification of the accident, compilation of statistics for future planning, and completion of records pertaining to the equipment and personnel involved.

43. Squadron Code Markings. The published purpose of squadron code markings was to enable friendly units and personnel to identify their own aircraft when airborne and to lessen the possibility of the use of a Cub behind our lines by the enemy. Actually it has been proven that its main uses are identification of the aircraft by friendly Air OP crews on the ground and in the air and differentiation between aircraft in the air by friendly artillery units. It was necessary to issue an order prohibiting ground units from taking any liaison type aircraft under fire because of periodic "scares" that the enemy was using a Cub of a certain number behind our lines. In no case was this proven the fact.

44. Army Flight Surgeon. A flight surgeon should be available at least in army headquarters and preferably one in each corps. The duties of a flight surgeon with the army should be:-

a. To know and observe the Air OP pilots in the command.

b. To recommend to the Army or Corps Surgeon policies of relief, rest, and treatment as may be indicated.

c. To contact battalion surgeons and indoctrinate them in the care of the pilot and in the special problems of operational stress and fatigue, and to elicit their cooperation in referring personnel to the flight surgeon for special study.

d. To supervise routine and special physical check-ups.

45. Reinforcement Pilots. Personnel were not available in sufficient quantities to meet the requirements of all units of the Army. Pilot reinforcements arrived at intervals and were only in sufficient quantity to bring units back up to strength after a period of being understrength. Reinforcements should be available on a basis of:-

a. A calculated percentage for combat, operations and other losses per month.

b. At least a 10% standing pool for rotation of pilots to rest centers so that units may be maintained up to strength.

c. At least three per cent per month for rotation of pilots to other field artillery jobs.

Operations

46. Flight Altitudes. With the German Air Force operating as it did during this campaign, Air OPs discarded the original doctrine of flying at not over 600 feet altitude and in the general locality of the battery positions. [illegible] continue to fly with relative impunity over the front lines and [illegible] well into enemy territory at 2,500 to 3,500 feet altitude. [illegible] observation on difficult targets.

47. Air OP Missions. Artillery [illegible] provided a most important means of observation to the field artillery. [illegible] patrol over the division front from dawn to dusk is of [illegible] in locating targets of opportunity and discouraging enemy artillery activity. Certain conditions of poor weather, such as low ceilings and restricted visibility have proven very hazardous to Air OP operations. Spearheading of armored columns with an Air OP very greatly accelerates the progress of the column. The Cub, flying as far as two or three miles ahead, finds road blocks, condition of bridges, enemy dispositions, etc. This type of operation is very costly in aircraft as it is necessary to use unreconnoitered landing strips in the immediate vicinity of the column

OPERATIONS MEMORANDUM)
NUMBER 1)

SERENADE

1. The purpose of the procedure outlined herein, which will be designated as SERENADE, is to expedite the massing of all available fires within a corps sector in extreme emergency, when lack of time precludes prearrangement of fire. The following SERENADE procedure will be followed by all units of this command.

a. Normally a request for SERENADE will originate with a forward observer who transmits to the battalion fire direction center the following:

		Example
(1)	The code word SERENADE, which indicates that three (3) volleys are to be fired.	SERENADE
(2)	Coordinates of the center of the area to be covered.	J301794
(3)	Nature of target.	40 tanks

b. The battalion fire direction center will transmit the request by telephone to the division artillery fire direction center. If the division artillery commander (or corps artillery group commander) or his authorized representative decides that the target warrants calling for fires in addition to those of his divisional (or group) artillery, he transmits over the corps artillery radio net to the corps artillery fire direction center his request for SERENADE. He includes the desired time at which the concentration is to fall. Normally Corps and Division Artillery Commanders should realize that an allowance of ten to twelve minutes must be made to insure that all battalions will be ready, and more time will be required if checks are necessary. Time must be synchronized periodically, and each battalion firing will make its own allowances for time of flight so that all projectiles arrive simultaneously in the target area. If surprise fire is not desired because of the exigencies of the situation, the words "when ready" will be used and firing commenced as soon as possible. Example of division (or corps group) artillery request for SERENADE:

SERENADE

J301794

40 tanks

1435 (or "When ready")

c. If the target is deemed sufficiently profitable, the corps artillery fire direction center assigns the mission to all headquarters whose fire capabilities permit, and who are not engaged on a more important mission. (Note: All corps and division artillery units will have been alerted upon hearing the transmission for SERENADE over the corps artillery radio net.)

d. Firing procedure:

(1) Each battalion, firing with its normal sheaf, and centered on the coordinates given, fires three (3) volleys at center range.

(2) Targets of more than 400 yards in width or depth are covered by including an additional set of coordinates in the request for SERENADE. When more than one set of coordinates are given, the method of attack will be in the order announced.

e. If the forward observer decides that it is necessary to continue the firing on the target, he reports "REPEAT SERENADE". The battalion fire direction center will relay the request by telephone to the division artillery (or corps artillery group) fire direction center. If the division artillery commander (or corps artillery group commander) or his authorized representative decides the request is warranted, he will transmit over the corps artillery radio net "REPEAT SERENADE".

Each battalion previously assigned the mission will repeat the firing without delay or further confirmation unless directed otherwise by its higher artillery headquarters.

f. Extreme care must be exercised to insure the accuracy of location on any request for SERENADE. This is the responsibility of commanders of all echelons handling such requests. They will be responsible that the coordinates given are accurate and that friendly troops are not endangered by the shoot. In addition, they are responsible that the requests are justifiable, and that the target warrants such an expenditure of ammunition. If there is any question as to the location of the target and adjustment of fire is necessary the mission "SERENADE" becomes one not of SERENADE but of adjustment and a request for additional fires and reinforcement.

SPECIAL RADIO NETS FOR ARTILLERY AND TANK DESTROYER UNITS

A. Army Artillery Radio Net - SCR 193

1. Composition of net - five (5) stations.

a. Army artillery headquarters (Net Control Station)
b. Each corps artillery headquarters.
c. Army air photo interpretation center.

2. Purpose of net.

a. To facilitate the exchange of artillery intelligence between the army artillery headquarters and the corps artillery headquarters, and between adjacent corps artillery headquarters.

b. To coordinate the fires of the artillery with the army.
c. To transmit from the air photo interpretation center, the results of air photo interpretation.

3. Operation of net.

a. Each station will be in the net continuously.
b. Corps artillery headquarters will call direct to the army air photo interpretation center station for photo information. This information will be disseminated to field artillery and tank destroyer units of a corps over the Corps Artillery Radio Net.

4. General.

a. Corps artillery S-2's should promptly transmit over the Army Artillery Radio Net, information of the enemy, as received, over the Corps Artillery Radio Net.
b. This net is not intended to replace the command net, but is to be used to provide a direct channel for artillery intelligence within the Army.

B. Corps Artillery Radio Nets - SCR 193

5. Composition of net.

a. All headquarters of field artillery units with the corps down to and including battalions.
b. All headquarters of tank destroyer units with the corps down to and including battalions.
c. Liaison officers with other units as directed by the corps artillery officer.

6. Purpose of net.

a. To promptly collect and disseminate artillery and tank destroyer information throughout the corps.
b. To expedite the massing of fires of the artillery and tank destroyer units with the corps.
c. To coordinate and obtain clearances for fire by division artillery in sectors of adjacent divisions and by corps artillery in sectors of supported divisions.
d. To provide quick lateral communication for obtaining supplementary observation on suspected hostile installations.
e. To provide corps artillery headquarters the means of disseminating air photo interpretation information direct to all subordinate field artillery and tank destroyer units.
f. To adjustment antitank warning within the command.
g. To transmit corps synchronized time.
h. Additional uses as prescribed by the corps artillery officer.

7. Operation of net.

a. The following stations are authorized to transmit and will remain in the net continuously:
(1) Corps artillery headquarters (Net Control Station)
(2) Corps artillery fire direction center.
(3) Division artillery headquarters.
(4) Field artillery and tank destroyer group headquarters.
b. Each field artillery and tank destroyer battalion with the corps will be in the net from 0600 hours to 2000 hours daily. These stations will not transmit but will stand by in the net and log the information received. These units will comply with calls for massing of artillery fire.

8. General.

a. This net is not intended to replace the command net but to supplement it, and to facilitate communication between field artillery and tank destroyer units with the corps.
b. Division artillery and group S-2's should promptly disseminate over the net, all information of the enemy, including the source of such information.

Digitized by Google

c. Units may operate the net with the SCR 284, pending receipt of the SCR 193.

OPERATIONS (SIGNAL TRAFFIC)

MAGIC 3)

OBSERVATION OF ARTILLERY FIRE BY FIGHTER-TYPE AIRCRAFT

1. References. - Section V, FM 105 and Chapter 1, FM 6-140.

2. General. - Fighter-type aircraft may be needed to adjust long-range artillery when the target is not visible to ground observers or artillery air OPs. When this need arises, the corps artillery commander will direct the air support officer at corps headquarters the necessary instructions to complete a mission (see paragraph 3). The air support officer reports to air support headquarters by radio and may note the mission. Air support headquarters decides whether the mission can be flown. In the way, set is approved the pilot is furnished the necessary information to effect the mission. If necessary, the artillery member of the reconnaissance group or the air support officer may be sent to the aircraft to brief the pilot.

3. Required information for mission. - The information given to the air support officer at corps headquarters, preliminary to arranging a mission, should include:

a. The end purpose of the mission, whether observation of a prearranged concentration, adjustment of fire on a selected target.

b. Nature and exact location of target.

c. Magnetic bearing of gun to target line, to nearest five degrees.

d. Time of impact of artillery fire on target (for prearranged concentrations).

e. Time element - The time interval between the pilot's command to fire and the instant the burst appears at the target. Time elements include the time in flight of projectile, transmission time, and all other factors, which will be determined and estimated by the corps fire-direction center.

f. Type of ammunition (high explosive, smoke, or both).

g. Identity of artillery unit which will fire the mission.

h. What battery or battalion is to fire adjustment (if an adjustment is to be).

i. Number of rounds to be fired for effect.

j. Any other information considered pertinent to the success of the mission, i.e. height of the battery, etc.

4. Communication.

a. Radio. - The vehicular VHF radio set from the air support party will be operated, whenever, the corps fire-direction center. The pilot, upon taking off, will establish radio contact with the vehicular VHF radio set from the air support party and will report when ready to observe. Air support officer will handle ground communication for all to ground and ground to air.

b. Wire. - The corps fire-direction center will establish telephone communication with the vehicular VHF radio set from the air support party. The pilot's sensings and commands are relayed by telephone to the corps fire-direction center, thence by telephone direct to the unit designated to fire the mission.

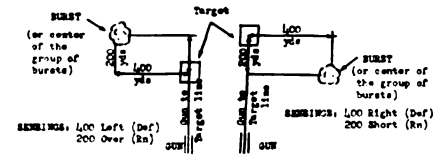
c. The normal method of communication will be two way R/T employing the vehicular VHF radio set from the air support party and the set in the fighter-type aircraft.

d. Pilots will check communication with the vehicular VHF radio set from the air support party when airborne at a given time prearranged prior to sortie.

e. Where possible an alternate channel will be designated prior to mission.

5. Missions. - Two types of mission are flown.

a. Observation of a prearranged concentration. - The mission consists of observing and reporting by a single sensing, the overall effect of a prearranged concentration of a specified target. Example: Target is a specific road junction, concentration to fall at 1500 hours. The pilot observes the concentration and sums up its effect in one sensing, such as: "Effect good" or "200 over", or "100 right, 200 short". If possible, he should observe the corrected firing and report final effect.

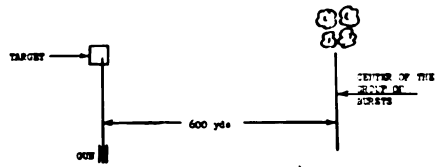


b. Adjustment of fire. - The mission consists of adjusting the fire, by successive sensings, to place the center of impact on the target.

6. Method for adjustment of fire.

a. Sensing. - The sensing of a burst (or group of bursts) is reported in two parts:

(1) Deflection sensing: Yards right or left of the gun to target line, measured at the target.



(2) Range sensing: Yards over or short of the target, measured along the gun to target line.

b. Importance of gun to target line. - It is most important for the pilot to visualize at the ground the direction of the gun to target line. Otherwise, he cannot distinguish between the deflection and range elements in his sensing; that is, he is unable to make an accurate report and the mission is wasted.

c. Procedure. - In reporting his sensing, the pilot should endeavor at first to bracket the target quickly. There is a natural tendency to underestimate, which leads to "creeping" toward the target with the resulting waste of time and ammunition. If the first burst is so far off that the gun to target line may be crossed, make a wide deflection change; for example: "400 right", "Repeat Range".

d. Number of guns. - As prearranged, adjustment may be with one, two or all guns. When more than one gun is used, the method of fire is by volley (guns firing simultaneously). When volley fire is used, the pilot senses the center of the group of bursts as a single burst or main point of impact. For example: "400 right", "Repeat Range".

e. Smoke. - It may be prearranged to fire the initial round with white phosphorus smoke, as an aid to the pilot. If the pilot fails to locate HE bursts, he may report: "Lost, fire smoke".

f. Completion of adjustment. - Adjustment is completed when the deflection is sensed on the gun to target line and the target lies inside of a 200-yard range bracket. Upon completion of a mission the pilot transmits: "Mission accomplished". The corps fire-direction center causes the ground station to transmit: "No further need of you". The plane then returns to the airdrome.

7. Example (two way radio procedure).

(Call Sign: Able) Pilot to Ground	(Call Sign: Baker) Ground to Pilot	Remarks
Baker from Able - Ready to observe		Plane arrives in area. Pilot orients himself and reports in.
	Able from Baker - Battery is ready	Pilot knows five constant and gives command to fire so that he will be in position to observe at time of burst.
Fire		Battery is always fired on command of the pilot.
	Battery has fired	Information for pilot that battery has fired.
200 Left 400 Over		Sensing
	Roger - Wait	Guns are corrected and prepared to fire.
	Battery is ready	Report to pilot to enable him to get in position to observe second burst.
Roger - Wait		
Fire		
	Battery has fired	
100 Right 200 Short		
	Roger - Wait	Guns again corrected based on last sensings.
	Battery is ready	
Roger - Wait		
Fire		
	Battery has fired	
100 Over Fire for Effect		Pilot requests "Fire for Effect" having split 200 yd range bracket. He indicates deflection is correct by not sensing deflection ("Range is always sensed").
	Roger - Wait	All batteries are corrected with latest sensing.
	Baker firing for effect Able firing for effect Charlie firing for effect	Each battery is fired as soon as possible. Pilot is notified as each battery commences fire for effect.
Mission accomplished		Sensings are made to correct individual batteries that are not on the target (i.e. "Charlie 100 right, repeat range"). If more fire is needed, pilot requests "Repeat fire for effect".
	No further need of you	Pilot returns to base.

Note: The pilot may find it impossible to continue the mission due to enemy interception. He transmits, "Unable to continue mission", and returns to base.

ANNEX NO. 4

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

9 June 1944.

OPERATIONS MEMORANDUM)
NUMBER 15)

ANTITANK MEASURES IN OFFENSE AND DEFENSE

1. GENERAL.

a. Antitank Officers. The following officers are designated as "Antitank Officers" of their respective units. They will be assisted by an officer from the highest attached tank destroyer headquarters.

Division - Division Artillery Officer
Corps - Corps Artillery Officer
Army - Army Artillery Officer

b. Available Antitank Means.

(1) The antitank means in divisions, corps, and army will be highly coordinated and disposed in depth. All available antitank means including attached artillery, antiaircraft, tank and tank destroyer units will be employed. In addition, maximum practical use will be made of demolitions, obstacles (natural and artificial), road blocks, tank traps, and mines.

(2) Each smaller unit will dispose its antitank means initially for the sole protection of the unit, coordination with higher and adjacent echelons will follow, so as to present an all-round antitank defense.

2. WARNING SYSTEM.

a. The primary means of transmitting information of impending or actual armored attacks will be by broadcast directly over the special Army and Corps Artillery SCR 193 Radio Nets. Each station will be in each net continuously. (This is a change in the instructions for the Corps Artillery Net contained in Operations Memorandum No 2, TUSA, 21 April 1944).

b. This information will be transmitted by voice. Each warning will be repeated three times. Warning messages will be modified "Flash Fox" type messages. For "Fox" type messages, see Paragraph No 2, Signal Circular 42-1, Prearranged Code. These messages will be transmitted in the clear. Essential elements of the broadcast will be:

(1) Number of tanks.

(2) Identification (type of tanks).

(3) Location of tanks expressed in grid coordinates (clear).

(4) Direction of movement.

(5) Speed of movement.

(6) Time reported.

c. Upon completion of the transmission only the following stations will receipt, in the order listed below:

Div Arty Headquarters (from right to left).
FA Brig Headquarters
TD Brig or Group Headquarters

Using other means of communication, each of the above headquarters will assure themselves that their subordinate units have received the message. It is the responsibility of corps artillery headquarters, division artillery headquarters, and direct support artillery battalions to transmit the message by fastest practicable means to corps headquarters, division headquarters and infantry regimental headquarters respectively.

d. In addition to the special antitank warning net, tank warnings will be sent by normal telephone and radio nets, supplemented by messenger or other means if available.

3. TACTICAL EMPLOYMENT.

a. Tactical employment will be in accordance with the following:

(1) FM 100-5, Pars 250-254, 591-594, 634-642, 679-695 inclusive.

(2) Letter TUSA, AG 370.2 TD, 17 April 1944, Subject: "Employment of Tank Destroyer Units."

(3) Paragraphs 27 and 28 of Letter of Instruction #5, TUSA, 20 May 44, "Use of Armored Divisions."

ANNEX NO. 5

RESTRICTED

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

OPERATIONS MEMORANDUM:
NUMBER 8:

27 May 1944.

FIELD ARTILLERY INTELLIGENCE

1. GENERAL.

Field Artillery is unique among ground arms in its possession of both trained observers and a highly developed communications system and therefore it is an important agency for the collection and dissemination of information. This memorandum is issued to assure aggressive and efficient performance of their intelligence functions by all field artillery units of this command, and embraces doctrine that has been tested and proven in combat.

2. INTELLIGENCE AGENCIES - FIELD ARTILLERY.

Intelligence agencies include the battalion, the group, the division, the brigade, and artillery sections of Corps and Army. Additional sources of information include the superior, subordinate, supported, reinforcing, and adjacent units. Also there are specialized agencies, such as field artillery observation battalions and detachments, AAF air observation, air photo interpretation teams, radio intercept and radio position finder units. Each artillery echelon will exploit to the utmost all available agencies.

There must be a constant aggressive flow of traffic through these agencies in both directions. Information is pushed in and up to the higher echelons, intelligence down and out to the lower echelons.

The examination and interpretation of information that transposes it into combat intelligence is exclusively the function of echelons higher than the battalion. The battalion is the keystone in the intelligence arch.

3. SCOPE.

Intelligence duties of the field artillery battalion fall into two equally important categories, those specifically assigned, and those habitually performed.

S-2, whether of army, corps, or division, in formulating the search for information, will assign certain items to the artillery. These will come to the battalion in the form of definite requirements specifying precisely what information is desired and time desired. Battalion compliance will be aggressive and prompt.

The remaining intelligence duties, those which must be regularly performed in every field artillery unit for it to be wholly effective, are all-inclusive. They embrace every aspect both of the enemy and of the terrain not under our control.

The duties of battalion personnel are clear. They must aggressively seek information at all times. They must report promptly, accurately and fully. They must not interpret.

4. SPECIFIC DUTIES.

Certain items of information of a type that will most often come within the purview of artillery personnel merit detail discussion.

a. Friendly and Enemy Forward Elements. No information has greater importance than the current location of our own, and the enemy forward elements. The current location of at least our own forward elements must be on all firing charts at all times. Observers and liaison officers will aggressively seek out and report the locations of forward elements. Report will be made of all changes. If there be no change, negative reports will nevertheless be made at regular intervals.

b. Fire Missions. A target worth firing upon has high intelligence value. Each unit must therefore insure that the S-2 is promptly advised of all fire missions. Coordination between S-2 and S-3 is essential. One method, used successfully, has been to place the S-2 and situation map physically within the fire direction center.

c. Targets. Observers will promptly report all possible targets, whether for artillery or other weapons, and even though not taken under fire, the information will be transmitted laterally and to higher headquarters.

d. Enemy Activity. The slightest activity, no matter how small or seemingly insignificant, is indicative of the enemy's plans and intentions and so assumes intelligence value. Observers therefore will seek out information. Liaison officers will press the unit they are with for all possible information and promptly transmit it to their own CP. Certain more important activities to be sought out and reported include:

(1) Enemy Movements.

(2) Enemy Dispositions.

(3) Inactivity. Enemy inactivity has high significance. Accordingly, reports must be submitted by all observers at regular intervals, even though the report may be negative. In addition to its intelligence value, the negative report insures that the observer is functioning and has working communications. Care is necessary in making negative reports. For example, "No enemy observed" is accurate; "No enemy", in the absence of a thoroughgoing reconnaissance, is an unwarranted conclusion.

e. Enemy OPs. Enemy OPs, both artillery and of other arms, will be sought out with industry and imagination. Every effort will be made to locate them accurately.

f. Enemy Artillery. The location of enemy artillery is a matter of especial concern to all artillery units, for early ascendancy over hostile artillery is essential to success in combat. All artillerymen will consequently be on the lookout for enemy artillery. Reports on hostile artillery will be made as complete as possible.

g. Shelling Reports (Shelrep). Reports of enemy artillery fire received are a most important source of counterbattery intelligence. It is a function of infantry, artillery and all other branches to render such reports as promptly, accurately and as completely as possible.

h. Enemy Aircraft, Armored or Chemical Activity. Artillery units in addition to the usual defensive measures, must recognize the importance of immediate transmission of full information through normal and flash intelligence channels.

Digitized by Google

1. Prisoners and Captured Material. The field artillery battalion is neither equipped nor organized for handling prisoners of war, or captured materiel. It will constitute the methods of processing to be followed by field artillery and their units. Speed in delivery to the rear is imperative as prisoners give maximum information only if interrogated before the shock of capture or injury wears off.

j. Effect of our fires. Study of the effect of our fires by observers serves both as a check upon our efficiency and as a source of valuable information. Enemy positions that have been overrun will be carefully inspected wherever possible.

5. IMPROPER PRACTICES.

Combat experience demonstrates the serious failures occasioned by certain practices. Accordingly, all artillery battalions will insure that:

a. The S-2 or a qualified assistant will remain at the CP (FDC) at all times. The S-2 will not be detailed to extraneous duties.

b. The S-2 will maintain frequent contact with observers and liaison officers.

c. The S-2 will insure that liaison officers transmit information, available at their station, to the artillery channels.

6. REPORTS.

Intelligence reports must be carefully prepared and contain what was observed, (that is, the observer), where it was, when it was seen, and a statement of its significance. What, When, Where, What Enemy, and Who, are the irreducible minimum.

7. REPORTS REQUIRED.

Each corps artillery headquarters and artillery brigade headquarters will submit the following report to the army artillery officer:

"Daily counterbattery report" closing at (see operations annexes), and including:

(1) Enemy artillery activity.
(2) Enemy artillery dispositions.
(3) Ammunition expended by the battery.
(4) Deletions from the battery list No ____
(5) Additions to the battery list No ____
(6) General.

SECTION I

FIELD ARTILLERY COMMUNICATIONS

1. RADIO.

a. Call Signs and Frequencies. Call signs for all stations operating in Third US Army net and the frequencies thereof will be published by the army, corps or division SOI. If an artillery unit changes attachment, the unit Communication Officer will, as early as practicable, coordinate all frequency allocations with the Signal and/or Communication Officer of the new superior unit.

b. Voice and CW Procedure. Frequencies have had to be so closely allocated that no interference will be anticipated using voice procedure. Army, corps and, sometimes division nets such as school and rear areas of the ZI, will operate using voice procedure wherever possible. But all stations will be prepared to operate with CW procedure whenever voice operation proves unsatisfactory.

c. Silvan. Silvan is the only secrecy code authorized for use in the artillery SCR or with Army Artillery Officer Radio Nets. Cipher settings and key centergrams for use by all stations in all artillery nets, except intra-battalion nets, will be published in Third US Army SOI.

d. Authentication Code. Third US Army SOI will publish an authentication code for use of brigade, and will be published exclusively by the Army Artillery Officer and the Corps Artillery Officer Radio Nets.

e. Composition of Nets. Field artillery brigade headquarters, all operating army artillery, will normally be the net control station of the army Artillery Radio Net. Army artillery battalions will also be in the army Artillery Radio Net. But artillery assigned a secondary mission of reinforcing a particular corps or unit thereof, in that case their SCR 193 radios will operate in the Corps Artillery Radio Net.

Only one SCR 193 radio of headquarters and headquarters battery, Corps artillery, need be operated in the Corps Artillery Radio Net. This station will serve as NCS.

f. Serenade. Division artillery or group headquarters will normally transmit the request for Serenade by radio so as to alert all units. Corps and division artillery headquarters however frequently can and should assign the mission by telephone.

g. Artillery Air OPs. It is recommended that all artillery liaison planes align their "F" bands on their respective battalion's FM channel, their "A" bands on the FM channel of the respective division artillery, corps artillery or artillery brigade.

2. WIRE.

Each corps will reserve two channels on the corps switchboard for the use of the field artillery brigade regardless of whether the brigade is supporting the corps or not.

When tank destroyers are used in their secondary role as reinforcing artillery, the field artillery battalion will establish wire communication with the attached or reinforcing tank destroyer unit.

SECTION II

FIELD ARTILLERY REPORTS

1. GENERAL.

The following reports are required:

a. To Army Artillery Officers:

From	Subject	Remarks
Corps Arty Comdr, Arty Brigade Comdr	Arty CPs & Air OP Landing Strips	When - as changes occur. Contents - location of Corps, Brigade, Div, and Group Arty CPs, and location of Air OP landing strips of own units.
	Daily Counter-battery Report	When - Daily. Contents - See FUSA Opns Memo No 6, subjects "Field Artillery Intelligence".
	Intelligence	Critical information of enemy in so far as enemy artillery, equipment installations, and assemblies, etc., immediately by most expeditious means available.
	Unit Efficiency	When - upon relief of Army Arty unit from attachment to Corps or Brigade. Contents - brief statement covering operations of unit, general efficiency status of personnel and equipment, and recommendations for maintained combat units.
	Consolidated ammunition expenditure report	Copies of ammunition reports as are compiled by Corps will be furnished Army Arty Officer
All Arty Officers	General	Submit, at any time, views, observations or suggestions as to FA or CA operations, techniques, or equipment. May be published in AIB.
Corps, Brigade, Div & Group Arty Air Officer	Aircraft monthly operations report	When - 5th day of each month. Contents - See Annex 7 to Administrative Order No 1, Third US Army

b. To Mobile Reclamation and Repair Squadron.

Corps, Brigade, Div, & Group Army Air Officer	Damage of aircraft (requiring repairs beyond field repair capabilities)	See paragraph 6 c, Annex 7, to Administrative Order No 1, Third US Army

By command of Lieutenant General PATTON:

THOR J. GAFFEY
Major General, U.S. Army
Chief of Staff.

ANNEX NO. 7

CONFIDENTIAL

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 405

AGENDA FOR SURVEY CONFERENCE, TUSA

1. Plan for the recovery and extension of survey control by combined efforts of Survey Platoons and Field Artillery Observation Battalions during operations.

2. Operation and function of the Army Survey Center.

3. Discussion of Corps SIC operations with relation to paragraph 2.

4. Technical discussion:

a. Value of trig lists.

b. Available maps.

c. Trig lists to be supplied to troops

(1) Time supplied

(2) Form of data

d. Survey technique.

PLAN FOR THE RECOVERY AND EXTENSION OF SURVEY CONTROL BY COMBINED EFFORTS OF SURVEY PLATOONS AND FIELD ARTILLERY OBSERVATION BATTALIONS DURING OPERATIONS

1. GENERAL:

a. An Army plan involving control for armies as large as France, Belgium, Holland and Germany presents problems for the Corps Engineers. If executive, there are a definite and mostly automatic system (Modern methods of less value) and otherwise. They do, however, require time and highly trained personnel.

b. First lately for us, control has been carried out by various plotting and army units to whose operation accustomed first triangulation by Cassini in the early 19th century. These are and are to be seen adjusted and the points placed in the proper positions. This information is on Table 1 the form of trig lists which have been established in comparative tests.

c. While it is true that some of these positions may be out a plus or minus 10 meters, this use of the positions as given should not affect the accuracy required for artillery use.

2. The problems to be solved by this plan are as follows:

(1) The organization of Survey Platoons (Corps and Army) with the Observation Battalions so that the proper breakdown of personnel will produce the maximum operating efficiency.

(2) Define the command of units within the breakdown.

(3) Define the function of each unit and its responsibilities.

(4) Standardize technique so that each step is carried out with a minimum of time and effort.

(5) Show by example the actual effect of the various types of errors on the final result.

3. ORGANIZATION:

a. Topographic Section (Engineer Section).

b. Army Survey Center (Survey Platoon, Engineer Topographic Battalion).

c. Survey Information Center (Corps Survey Platoon and Observation Battalion groups).

4. RESPONSIBILITIES:

a. The Topographic Section will assemble, evaluate and distribute the trig lists for the Army operational areas.

(1) It will supervise and direct the activities of the Army Survey Center.

(2) It will file copies of all new, revised and captured trig lists as they are received from any source in the theater, sending the original of these to the Army Survey Center, SHAEF, for consolidation, that not appropriate, if additional necessary, into trig lists (SHAEF).

b. The Army Survey Center will be responsible for the recovery and extension of points completing the major net.

(1) It will furnish Corps with points with which to start lower order nets.

(2) It will establish azimuth and furnish to Corps the angles and distances between the main triangulation and first order for use by Corps SIC.

(3) It will act as a reserve to Hq, Corps SIC when necessary.

(4) It will tie in Corps nets where differences exist.

(5) It will supply control to Artillery, under established Army control. This may or may not be accomplished together with an SA observation battalion.

c. Survey Information Center

(1) Will extend lower order surveys, from the major net furnished by Army Survey Center, to Corps, Division and Battalion Areas.

(2) The SIC will be in charge of the 20 of the Field Artillery Observation Battalion. The Engineer Survey Platoon (Corps) will be attached to the SIC as needed. It will be the responsibility of the Army Engineer to see that its function is so used that is in accordance with the general scheme of this plan. It will be the responsibility of the 20, Field Artillery Observation Battalion, that the talents of the Survey Platoon be utilized to the extent set forth in paragraph 4 c. (1) above and not used as a check on work done by Artillery personnel.

5. TECHNIQUE:

a. The methods to be used by ASC will conform to standard practice for 1:5000 accuracy or better.

(1) Azimuths are to be based on star observations which will be made during daylight whenever possible.

(2) Computations by graphical or logs to be made in field with final check at headquarters.

b. Corps SIC

(1) Triang lists will be carried out by these units whenever possible and will be run in order of major nets.

(2) The 4th traverse will probably be used in most circumstances. The order of traverse should be that an accuracy of 1:5000. This can be accomplished by double reading of the angles, single chaining with stadia checks, and star observations for azimuth.

(3) With proper training, survey of this order can be obtained with a minimum of personnel.

(4) Points where accuracy is below 1:5000 should not be furnished to units of Division or higher.

DECLASSIFIED

(5) For work from Division to Battalions, control should be held to accuracy of 1:3000 or better, and usually will consist of lines of transit traverse with either star or [illegible] Computations should be sufficiently accurate to [illegible] instrument accuracy.

(6) In the event that time permits the establishing of lines from Battalions to gun positions, there can be run with a transit, with distances by stadia, or by graphic plane table methods. The accuracy to be held to 1:750 or higher and computation made by logs or slide rule.

5. ERRORS AND THEIR EFFECT:

a. An error of plus or minus 10 meters in the starting point will not affect the accuracy of fire provided an astronomic azimuth is taken at start of line.

b. The results of a possible error of plus or minus 10 meters between two stations, occurring at right angles to the line between them, if used for an azimuth without an astronomic observation, is shown in Table I (attached).

c. Errors due to temperature changes are tabulated in Table II (attached).

d. It should be noted that these errors are cumulative, and unless corrections are made, they can cause errors of 1:3000 or more, depending, of course, upon the temperature at the time of survey.

AIR OP BULLETIN) 20 May 1944
NUMBER 1)

1. General. This bulletin is intended as a means of dissemination of all types of information or value in the training and administration of Artillery Air OP Sections, and in the maintenance, operation and tactical employment of field artillery aircraft. Efficient operation of the Air OP means increased striking power of the field artillery. Any information that is received by this headquarters which is sent to the Army Artillery Air Officer, Headquarters Third United States Army, APO 405. These bulletins will be classified only as may be required by the local security situation, and distribution will be made so that all concerned may receive information promptly and have it available for ready reference.

2. Operating Procedure. For the information and guidance of all concerned, a copy of Annex Number 2 to Administrative Order Number 1, this headquarters, dated 11 April 1944, in format attached as Inclosure 1.

3. Supply Procedure. Requisitions will be made on SOS, Third Tactical Air Depot, APO 140, and dispatched to Army Artillery Air Officer for approval. (Reference paragraph 3, Annex 2 to Administrative Order No 1, this headquarters, dated 11 April 1944.) If the requisitioning Air Officer so desires, the words "hold for pick up" may be entered in the requisition space on the face of the requisition. The Army Artillery Air Officer will notify the unit when equipment is ready for pick up. Otherwise equipment will be shipped to unit or an intermediate point for pick up. ASC requisitions are covered in Inclosure 1. The following is extracted from paragraph 2 b (10) (c), Administrative Order Number 1, this headquarters: "Requisitions will not be classified. The heading on the requisition will include only: 1. The Organization's serial Number, (recent arrivals who have not yet been assigned an SOS serial number, will use their shipment task force number), 2. geographical location, 3. railhead designation, and 4. telephone number. Organization designation (name) and APO number will not be placed on requisitions under any circumstances. 5. Unclassified requisitions will be enclosed in double envelopes when mailed. The inner envelope will be addressed and stamped "Confidential". The outer envelope will be ad-

Digitized by Google

dressed and will also bear the return address (name and APO number of the unit)." Blank second sheet paper may be used for the carbon copies of requisitions. Space for signature of approving officer on Form 109 should be left blank.

4. Engineering.

a. Higher echelon maintenance. Requests for higher echelon maintenance and pick up of aircraft damaged beyond local repair should be directed to the Engineering Officer, or the Assistant Engineering Officer, Third Tactical Air Depot, telephone number Wantage 200, extension 300 or 309, in accordance with paragraph 6 e, Inclosure 1.

b. Spark plugs. Difficulty in removing spark plugs has been encountered in certain cases where no anti-seize compound has been applied to the threads of the plug upon installation. To prevent this, the following compound should be applied sparingly, care being taken to keep the electrodes free of grease:

Compound, Anti-seize, Mica Base; Class OC-B
Specification AN-VV-A-576
Stock Number 7510-0-52000

One-pound cans are available on requisition through normal artillery air supply channels. Caution should be exercised to insure that only mica base anti-seize compound is used on spark plugs as other types will cause freezing.

c. Compasses. All aircraft compasses must be swung at least once every 100 hours of flying time or 90 days, whichever period is shorter, and frequently oftener under press of tactical use. This is most easily accomplished by following instructions contained in Technical Order 05-15-5. All compasses of new aircraft issued in this theater have shown marked deviation from the compass correction card installed, up to as much as 40 degrees in some cases.

d. Technical Orders. Requisitions for Technical Orders should be made direct to the Army Artillery Air Officer. It should be borne in mind that the supply of Technical Orders is very limited and cinemegraph copies only will be available.

e. Blank forms. Requisitions for blank forms should be made in the same manner as requisitions for parts and supplies.

5. Training and Operations.

a. SD 1C. Paragraph 5 a, Annex No 7 to Administrative Order No 1, this headquarters, requires that British SD 1C be requisitioned and is quoted in part: "Units will submit requisitions in accordance with provisions of Circular 77, Headquarters AFHQ, dated 18 December 1943." For the information of those who have not yet placed such a requisition, Circular 77 has been replaced by Circular 30, Headquarters AFHQ, dated 16 March 1944. Requisitions should be in letter form and must be through channels.

b. Pilot Training. Navigation training is important at the present time, for as Lt Col [illegible] says, "In the United Kingdom is different from that in the United States. A combination of unfamiliar maps, strange terrain, lack of prominent identifiable terrain features, and large distances in the air speeds of new aircraft delivered to units has accounted for pilots becoming lost. Compass errors can be corrected by a simple swinging as explained in Technical Order 05-15-5. This should be done immediately after delivery of new aircraft and again toward the end of the first month's operation. Thereafter, the interval between swinging should be not greater than that recommended in Technical Order 05-15-5 and as short as conditions warrant. Pilot proficiency training should be accomplished under full load conditions. A solo hop and a fully loaded hop are the two different aircraft in making short field landings and takeoffs. Unit commanders and pilots should realize this, and full load practice complete with passenger and radio or the equivalent weight should be emphasized. Several accidents have resulted from pilots landing in too small fields and then cracking up on taking out. In flying out of a questionable field it is not often impossible to first give it a solo try and then return to pick up the passenger or proceed to a larger field.

c. Observer Training. The following is quoted from First U S Army Artillery Information Service, February 1944:

"Methods of training will vary with the policies of the division artillery commanders, the time, the areas, terrain and facilities available. Only suggestions of more or less general application can be laid down, but briefly, selection of instructors should be made with the utmost care and the training program outlined by them should be worked out in the fullest possible detail to cover all phases from basic instruction to completion of the observation course by intensive aerial firing.

Certainly a brief period should be allowed for 'conditioning' flights in which the candidate will learn the maneuvers of a plane, its flight characteristics, and how physically and mentally to adapt himself thereto. These preliminary hops should gradually merge into orientation flights during which the student will learn the differences in the appearance which varying terrains present when viewed from the air. He will learn to judge distances from various altitudes and will gradually acquire the knack of tying in ground patterns as seen from the air with the map depiction of those same patterns. His aerial map reading will begin to be automatic rather than studied.

"More intensive training should be started in joint identification. The observer must be taught and must learn how, speedily, and accurately, to locate on a map, an indicated point on the ground as well as the easier task of spotting on the ground, from the air, an indicated map point. The length of time necessary to teach this will vary with each individual. Highly skilled instruction is necessary but no candidate should be considered qualified until he is thoroughly competent in this most important phase of aerial observation.

"Observation of maneuvers and emplacements of friendly troops from normal altitudes and distances will aid the development of this all-important knack of target identification. Talks by battle-trained observers and study of aerial photos, obliques in particular, will help. The student must be shown how to search an area for the usual ordinances of enemy batteries and other emplacements. He must be told their customary tactical dispositions. He should be taught to 'spot' a gun's flash and how, hastily but accurately, to pin point it on the ground as a prerequisite to locating its position on a map. This he will learn is vital, because of the long time lag' will be seen but once, while the gun itself is difficult, even impossible, to detect.

"When this stage of training is successfully completed, and not until then, the student will be ready to begin actual observation and conduct of fire from the air. First he should be shown burst patterns, should learn what smoke, high explosive, ricochets and time fire look like from the air. He should learn the appearance of normal shell and become accustomed to judging bursts and range deflection deviations from widely varying angles and altitudes. He will learn the differences between range rounds of 50, 100, 200, 400, and 800 yards as viewed from a plane, and should soon be able to tell that of like on the ground and in his own mind regardless of the tanks and burns he may see walking. He will begin to estimate time of flight and so to indicate to his pilot the approaches desired to permit best observation.

"Once all this has been mastered the actual conduct of fire will prove simple. The very few variations from normal forward observer procedure and technique will present no difficulties to the student, who, as he must, already knows how to shoot.

"In the final analysis, of course, only actual missions in combat will produce skilled and experienced observers. Completion of a course such as has been briefly sketched will, however, develop trained officers who will readily, quickly and smoothly assimilate battle experience.

"The artillery of any division should have a constant available pool of from six to twelve observers so trained, in addition to such pilots as may also be trained artillery officers. (Experience has shown conclusively, incidentally, that it is almost impossible for a pilot to fly a plane in combat and observe for artillery purposes at the same time, hence no reference is made to efforts which have been made to combine the two functions.) Whenever pilot is training should be carried out to increase this nucleus or to provide for replacements to maintain such a quota.

"The term 'pool' as here used does not imply a separate group, detached from the individual battalions. What is actually meant is that there should be at least two, preferably three, qualified observers available at all times within each battalion."

The following extract from Employment of Field Artillery, II Corps, in the Sicilian Campaign is noteworthy:

"Units that had trained officers for the specific job of air observer were able to obtain maximum use of their Air OPs. These units reported a large number of successful air missions. Units that used untrained air observers experienced difficulty in successfully employing their Air OPs. These units reported only a small number of successful missions."

6. Accidents.

a. Aircraft accidents continue and the causes are all traceable to one of the following:

(1) Pilot error.

(2) Overloading of aircraft.

(3) Unauthorized persons flying aircraft.

(4) Carburetor icing.

(5) Contour flying in strange areas.

(6) Low altitude aerobatics.

b. In order that personnel concerned may learn from others' misfortunes, a brief summary of major accidents with comments by the Army Artillery Air Officer will be published in Air OP Bulletins.

c. Recent accidents.

(1) Pilot, with mechanic as passenger, was contour flying"...plane struck power line and crashed. Power line was low over an open field and was partially hidden as it blended in perfectly with the turrets." It was stated that a reconnaissance of the area had been made.

Comment: None.

(2) Two pilots, ferrying an aircraft to their home station, became lost and landed in a small field to ascertain their location. This field was approximately seventy yards long with a pole line along the road and trees a short distance beyond. In the take off the pilot (with passenger) cleared the wires but crashed through the tops of the trees, and landed beyond them in the characteristic tail or spin attitude: nose end and wing tip first. This resulted in fatal injury to the pilot flying and serious injury to the other pilot.

Comment: Upon becoming lost, one is apt to get more or less excited or apprehensive, and it must be remembered that under such conditions, judgment is apt to suffer. Therefore, pick a large field, or pick a small one and be content to pull the wings off and live to tell.

(3) Pilot and passenger on a cross country flight became lost and landed in a small field to obtain directions. The field, however turned out to be too small and on take off the pilot was unable to clear a stone fence. The aircraft was ruined but pilot and passenger were unhurt.

Comment: None.

(4) Extracted from First Lettow Sutton Army Air OP Bulletin No 3, of 16 March 1944:

"(1) Pilot and passenger were operating out of a field outside of a barrage balloon area. An observation barrage balloon was located near the side of the field and was not visible to the pilot as the balloon was in the overcast at 500 feet. In circling the field the aircraft wing struck the cable which constituted a leading edge to the front spar, stalling the aircraft. With full throttle, the pilot went forward on the stick and tried to disengage from the cable. He was unable to do this so he throttled back and spiraled down with the cable still in the wing, crash landing to the top of a tree. The passenger was unhurt and the pilot suffered minor head injuries.

"Comment: The pilot by maintaining flying speed and keeping his head was able to effect a good forced landing with only minor injuries to personnel.

"(2) Recently a pilot, after making several low drags over a strange field in order to plan his approach, made a power approach or assumed, cleared the edge of the field and touched down on the slight positive slope of the field. The pilot was unable to check his landing roll due to wet slippery grass (it having rained earlier in the day) and the aircraft skidded into a stone fence resulting in major damage to the aircraft, however, the pilot and mechanic were uninjured.

"Comment: Precautious about landing in small fields that require braking to stop roll when the conditions of the ground is likely to be slippery.

"(3) While pilot and observer were flying at about 1,000 feet altitude, two miles northwest of [illegible], the engine started to lose RPM due to carburetor icing. Heat was immediately applied, but the engine did not pick up RPM. At about 400 feet altitude the engine cut out completely and the pilot prepared to make a forced landing. On the approach end of the field selected were trees and the supporting poles of a high tension line running along the edge of the field. The pilot, unable to see the wires flew into them, stalling the aircraft which crashed on its nose. Pilot and passenger were both injured, the pilot sustaining serious injuries. The aircraft was demolished.

Digitized by Google

"Coment: Except when the maximum RPM is required for short periods of time, carburetor that should always be used when outside temperatures are between -60C and +20C. Carburetor icing conditions prevail at this time of the year in the UK. WHEN IN DOUBT USE CARBURETOR HEAT."

By command of Lieutenant General PATTON:

ANNEX NO. 9

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

AG 300.2 (FA) - OPNCW 25 April 1944.

SUBJECT: Forward Observer Sections for Infantry Division Light Artillery Battalions.

TO : Commanding General, ETOUSA, APO 887, U S Army.

1. Recent campaign experiences indicate that 65 to 75 per cent of all artillery targets are provided by forward observers. In addition, a high percentage of tactical information originates with these observers.

2. Present T/O & E for artillery do not provide sufficient personnel and equipment to function as organized forward observer sections without reducing below the tactically minimum the battery personnel now authorized. It is therefore felt that certain field artillery units should be authorized appropriate increases in order to fully perform their missions.

3. The following is recommended as the essential personnel and equipment for a forward observer section:

a. Personnel:

1 - 1st Lieutenant, FA
1 - Sergeant (T/O)
1 - Technician 5th grade, operator, radio (177)
1 - Driver (345)

b. Equipment:

2 - Radio Set, SCR 536
1 - Radio Set, SCR 610
2 - Telephone, EE-8-A
2 - Wire Unit, on Reel Unit RL-39 (miles)
2 - Tool Equipment, TE-22, sets
1 - Stove, gasoline, portable vehicle type
2 - Binoculars, M7
1 - Telescope, observation, M5
3 - Carbine, cal. .30, M1
1 - Pistol, cal. .45
1 - Truck, ¼-ton, C & R
1 - Trailer, ¼-ton

4. It is recommended that tables of organization be changed to provide that forward observer sections be assigned on the basis of one per medium battalion headquarters battery (T/O & E 6-36) and one per firing battery in light battalions (T/O & E 6-27 and T/O & E 6-167).

For the Commanding General:

/s/ Hugh J. Gaffey

tion that is desirable to pass on to other units should be sent to the Army Artillery Air Officer, Headquarters Third United States Army, APO [illegible]. These reports will be used locally, or required by the Information and Education Section, for historical purposes.

2. ADMINISTRATION.

a. Operations and Status Reports. Each corps artillery headquarters, [illegible] Army Artillery Air Officer, [illegible] and consolidate all artillery reports. All reports of aircraft of the Army Artillery Officer's as to remain in the headquarters or in helping the [illegible] must report showing the fixed [illegible] of the Army artillery Air Observation Section as prescribed by the Chief of the Air Corps. In addition to the requirements set forth in section [illegible] of the directive, the following status report will be rendered [illegible] and will show:

(1) Personnel

(a) Pilots. Each assigned pilot by name, rank, serial number, organization and total number of hours in aviation.

(b) Mechanics. Each assigned mechanic by name, rank and serial number and organization. [illegible] will not be included unless graduates of the Airplane Mechanics Course, Field Artillery, School.

(c) Number of pilots authorized, and number of mechanics authorized.

(2) Aircraft

(a) Aircraft by type, AAF serial number, squadron code marking and organization to which assigned. Detailed time, and condition or extent, good, fair, poor, unserviceable) of each aircraft will be indicated.

(b) Time. Total number of hours flown by all aircraft during period of the report.

(3) Maintenance.

(a) Major repairs or maintenance performed locally. Show aircraft by serial number and extent of work accomplished.

(b) Aircraft turned in to M.R.& R. Squadron for major repair, maintenance or salvage (show aircraft serial number).

(4) Missions (number of missions in each category):

(a) Adjustment of fire - combat.

(b) Reconnaissance - combat.

(c) Patrol - combat.

(d) Night - combat.

(e) Other - combat (state nature).

(f) Training.

(g) Administrative.

(5) Miscellaneous.

(a) Maintenance or supply difficulties.

(b) Explanation of new uses made of aircraft.

(c) Explanation of any changes made in aircraft or allied equipment, that have been found beneficial.

b. Operation of Artillery Air Fields. When circumstances [illegible] artillery air fields [illegible] Army artillery, division artillery and field artillery group and brigade headquarters will be transmitted direct to the Army Artillery Air Officer without delay upon location or relocation of such fields.

c. Accidents and Accident Reports.

(1) Report of major aircraft accidents will be made direct, or through Corps Artillery Air Officer, to Army Artillery Air Officer within twenty-four hrs. If accident by the most expeditious means available. Prompt reporting will insure dispatch of pickup crew and replacement of aircraft. Report will include:

(a) Aircraft serial number and/or squadron code marking.

(b) Pilot's name.

(c) Location of accident.

(d) Exact location or point where pickup crew may meet guide.

(e) Nearest town.

(f) Name of corps, division, brigade or group Artillery Air Officer of unit in which aircraft is assigned.

(g) Condition of aircraft with especial reference to destruction by fire.

(2) Crash pickup. Damaged aircraft requiring third or fourth echelon maintenance will not be used by crash pickup crew. Crash pickup crew will be dispatched from M.R.& R. Squadron immediately upon receipt of report as required in paragraph 2 c. (1) above. Guard will be placed on crashed aircraft until aircraft is removed. Guard will be placed at point specified at time agreed upon to meet pickup crew and will remain there until crew arrives.

d. Communication channels. Artillery Air Officers of corps, division, brigade, field artillery group and separate battalions will communicate direct with Army Artillery Air Officer on all routine matters pertaining to Artillery Air Service. All written communications addressed to [illegible] for the attention of the Artillery Air Officer in any headquarters should be marked "Artillery Air Officer". Whether headquarters be [illegible] Air Service Group, Air Depot, Air Base, or Wing headquarters only the "Air Officer" should be mentioned to avoid delay in delivery.

e. Award of Pilot Air Medal. Circular 59, Headquarters European Theater of Operations, U.S. Army, May 11, 1944, is quoted for the information and guidance of all concerned:

"59. Field Artillery, Pilots and Observers qualify for the award of the Air Medal by either:

"a. Any single meritorious act while participating in aerial flight, or

"b. Thirty-five (35) sorties.

"(1) A sortie is an flight in which the airplane is attacked by enemy aircraft or any intense flight which involves either:

"(a) Adjustment of artillery fire on an enemy installation;

"(b) Surveillance of artillery fire on an enemy installation;

"(c) Registration of artillery fire on an enemy installation; or

"(d) Front line reconnaissance of at least one hour duration.

"(2) Credit for sorties.

"(a) Credit for only one sortie will be given regardless of any combination of the above missions which may be accomplished on any one flight.

"(b) Credit for a sortie will be given only when every effort for the accomplishment has been made. Such credits will be specified and approved by the battalion, group, brigade, division, corps or army artillery commander."

3. SUPPLY AND MAINTENANCE.

a. General. The 43d Mobile Reclamation and Repair Squadron has been designated to perform higher echelon maintenance and act as technical adjutant for Air Service of the Third US Army. Corps artillery Air Officers will be notified of the location of this unit as its moves from place to place. Generally this unit will move to each new location to give work to the service and the section will be tactically located at the Army Air Strip.

b. Higher Echelon Maintenance Policy. Until such time as the M.R.& R. Squadron accumulates sufficient backlog of work, it is prepared to accomplish any maintenance which cannot be expeditiously handled by Air Service units in the field. Units operating to keep an aircraft active, and having on aircraft requiring an engine change or which would be faced with the probability of having a grounded aircraft for a prolonged period, should notify the M.R.& R. Squadron in such a case which will be called upon to perform the necessary maintenance. However, normal maintenance which can reasonably be accomplished by units will not be done by the M.R.& R. Squadron.

c. Supply. All items of supply which are consumed in the process of use, such as safety wire, cotter pins, fabric, dope, etc., will be supplied on Form 61a, which will be made out by the requisitioning unit and presented direct to the M.R.& R. Technical Supply Officer. All parts will be issued only upon presentation of a like damaged part; i.e., to obtain a propeller, or landing gear, a broken or otherwise unserviceable propeller or landing gear must be turned in. It is contemplated that division, corps, brigade, group and only separate battalion Air Section representatives draw supplies at the M.R.& R. base. Battalions should habitually obtain supply through their respective division, brigade, or group Air Section.

d. Replacement.

(1) Aircraft. All replacement aircraft will be made available at the M.R.& R. Squadron through the Army Artillery Air Officer. No aircraft will be issued without proper squadron code marking. Requests for replacement aircraft will be made direct to Army Artillery Air Officer by most expeditious means available and will include:

Organization (by code name or name of Air Officer).

Squadron code or serial number of aircraft to be replaced.

Status of unserviceable aircraft (damaged, burned, lost).

Particulars of accident.

Pilots and observers names and injuries, if any.

Location of aircraft to be replaced.

(2) Personnel. Requests for replacement pilots will be made direct to Army Artillery Air Officer by most expeditious means available and will include:

Organization (by code name or name of Artillery Air Officer).

Name of pilot to be replaced.

Reason replacement is necessary.

Particulars of accident.

e. Unserviceable Air Force Equipment.

All unserviceable aircraft or parts thereof will be turned in to the M.R.& R. Squadron as soon as practicable. If the case of aircraft to be turned in for salvage or repair of major damage sustained in an accident, report will be made in accordance with paragraph 2 c. (1) above. When any aircraft or engine is turned in for any reason, [illegible] forms (1 A Log, 41a, 41b, 61a) will be turned in with it. These forms will be maintained up to date at all times. No parts will be removed from unserviceable aircraft to restore other aircraft to flying status (cannibalism) unless such parts are not available from like, in which case the unserviceable aircraft from which parts are removed will be stripped of all usable parts while aircraft is turned in for salvage. Each aircraft turned in will be complete with all unserviceable or unserviceable. In no case will aircraft be considered to contain defective spare parts kits. If unserviceable parts will be taken from the aircraft preservation as serviceable parts. All available records will be turned in with the aircraft. [illegible] or engine [illegible] or [illegible] engines will be turned in completely reassembled.

f. Unsatisfactory Report (URs).

Air Force equipment defective design or basic defects due to faulty material, workmanship, or shop operation, and failure of [illegible] under normal use will be reported promptly on URs to the Army Artillery Air Officer. URs will consolidated and forwarded through the Army Air Force channels. Unless otherwise directed, defective parts and assemblies will be tagged as defective and turned into the M.R.& R. Squadron.

g. Spare Engines and Spare Parts.

Spare engines (complete), all cowls, tail surfaces, ribs, and struts may be turned into the M.R.& R. as desired. The immediate availability of this equipment decreases necessity of maintaining such items on hand in units.

4. OPERATIONS.

a. Flights to United Kingdom.

No artillery aircraft will be flown to the United Kingdom

Digitized by Google

without prior approval and clearance through the Artillery Air Officer, this headquarters.

b. Squadron Code Markings.

(1) The purpose of squadron code marking is to:

(a) Enable friendly units and personnel to identify their own aircraft when airborne.

(b) Lessen the possibility of the use of a Cub behind our lines by the enemy.

(2) It is the responsibility of all concerned that:

(a) No field artillery aircraft be flown without proper squadron code marking.

(b) Any aircraft believed to be missing or lost over enemy territory be reported direct by the most expeditious means available to the Artillery Air Officer, this headquarters.

(c) Any field artillery aircraft observed displaying questionable squadron code markings be reported direct by the most expeditious means available to the Artillery Air Officer, this headquarters.

(d) Pilots should not circle any particular spot or small area unnecessarily as this draws suspicion upon the aircraft concerned.

(3) Certain squadron code markings at variance with those in use on artillery aircraft will be seen in forward areas on L-4 and L-5 aircraft. These are:

BC - 1 (through 10)
BR - A (through Z)
9S - A (through Z)
6C - A (through ZZ)

An L-1 aircraft may be seen operating in forward areas.

c. Flying Uniform. Leggings will not be worn by pilots or observers while flying. Hooks thereon are apt to catch in rudder cables and on projections in the aircraft. Abandoning of aircraft in flight is reported to have been impaired thereby. Heavy boots, or shoes, and other footgear that has any tendency to bind between rudder pedals and fuselage members next to pedals, will not be worn by pilots while flying. Paratroop boots or the equivalent well broken in are satisfactory in the smaller sizes; low quarter shoes are most satisfactory. Low or stiff, heavy boots make it very difficult for any but a short person to operate the brakes properly.

By command of Lieutenant General PATTON:

26 September 1944

MEMORANDUM:

TO : Artillery Commanders, XII Corps
XV Corps
XX Corps

1. In compliance with paragraph 3, Letter of Instructions No 4, this headquarters, dated 25 September 1944, it is desired that all corps artillery commanders prepare without delay overlays to the scale of 1/50,000 for prearranged concentrations on all possible avenues of tank attack for all artillery with the corps.

2. Concentrations will be numbered consecutively from north to south within each corps zone of action.

3. The following blocks of numbers are allotted to corps:

XX Corps - 1 to 999
XII Corps - 1000 to 1999
XV Corps - 2000 to 2999

4. The location of each concentration will be indicated by its center point and concentrations will be appropriately numbered.

5. Necessary registration and survey will be conducted by all artillery whose fire possibilities permit to insure accurate massed fire on the prearranged concentrations. Data for each concentration will be placed on data sheets arranged in logical sequence to aid the battery executives. Registration or metro corrections will be kept up to date.

6. Adjacent corps and division artillery commanders will be furnished ten (10) copies of each appropriate overlay. Thirty (30) copies will be furnished this office for distribution to echelons of XIX Tactical Air Command. Additions or changes to the plan will receive the same distribution.

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

18 October 1944

AIR OF BULLETIN)
NUMBER 3)

1. AD INVESTIGATION.

a. Operations and Status Reports. These reports will be submitted in duplicate so as to reach this headquarters on or before the tenth of each month covering the operations of the previous month. Subject matter required is covered in paragraph 2 a, Air Of Bulletin Number 2, this headquarters, dated 1 September 1944, and in addition hours flown by each pilot for the period will be included. A sample form for local reproduction and use if desired is attached hereto as inclosure number 1.

b. Accident Reports.

(1) Paragraph 2 a, Air OF Bulletin Number 2, this headquarters, dated 1 September 1944, is rescinded.

(2) Any incident resulting in loss of or major damage to aircraft, or loss of or major injury to a pilot, or observer, will be reported in accordance with the provisions of letter, Headquarters Twelfth Army Group, file AG 373.2 (Arty), subject: "Field Artillery Air Of Loss Reports", dated 12 September 1944, with first indorsement, this headquarters, dated 21 September 1944. Three copies of "Air Of Loss Report" form are attached to each copy of subject letter. Additional copies may be obtained from Corps Artillery Air Officers or either echelon of the L R & R Squadron.

(3) Preliminary report of any incident resulting in loss of or major damage to aircraft, or loss of or major injury to a pilot or observer will be made by most expeditious means available to Army Artillery Air Officer, direct, by the Artillery Air Officer of the corps, division, group or separate battalion concerned; prompt reporting will expedite replacement. Information given will be:

(a) Pilot (Name of and result to).

(b) Aircraft (Serial number and squadron code marking of and result to).

(c) Location of aircraft.

(d) Whether or not L R & R Squadron has been notified (see paragraph 1 d, below).

c. Separate Battalions. For all purposes in connection with Air OP activities, separate battalions are only those battalions not operating under a corps artillery, division artillery, field artillery brigade or field artillery group headquarters.

d. Crash Pickup. Damaged aircraft requiring third or fourth echelon maintenance will be picked up by the appropriate echelon of the 43d L R & R Squadron. Artillery air officer of corps, division, field artillery brigade or group concerned will initiate action by contacting 43d L R & R Squadron either direct or through the Army Artillery Air Officer. Information in items (1) - (5) below will be reported and provision made for a guide to lead crash truck from the L R & R Squadron location, or from other agreed upon meeting point to the location of the damaged aircraft.

(1) Aircraft serial number.

(2) Pilot's name.

(3) Location of aircraft.

(4) Location of point to meet guide.

(5) Condition of aircraft.

e. SD 533; SD 158.

(1) Letter, Headquarters Twelfth Army Group, subject: "Discontinuance of Distribution", dated 25 September 1944, states that distribution of SD 533 (CONFIDENTIAL) and Amendments, to field artillery units as pertaining to field artillery Air OPs has been discontinued. All copies of this publication now in the hands of field artillery troops will be returned to AG Publications, Headquarters European Theater of Operations, APO 887, U S Army.

(2) All copies of SD 158, "Routing Recognition and Identification of Aircraft", parts 1, 2 and 4 with amendments thereto, in the hands of field artillery units will be returned to AG Publications, Headquarters European Theater of Operations, APO 887, U S Army.

2. SUPPLY AND MAINTENANCE.

a. General. So much of paragraph 3 a, Air OF Bulletin Number 2, this headquarters, dated 1 September 1944, as prescribes one section of the 43d L R & R Squadron will be habitually located at the Army Air Strip is rescinded. Each echelon will be located so as to render the best service to the corps which that echelon supports.

Digitized by Google

b. Engine changes. Several engines turned in to 434 M R & R Squadron for exchange have been stamped since removal from aircraft. Moisture condensation within cylinders owing to open spark plug holes had caused rusting of cylinder walls. Engines so damaged cannot be rebuilt, as oversize pistons are not available. When engines are removed from aircraft for exchange or temporary storage, the following preparations will be accomplished:

(1) Remove oil from sump, wire drain plug to engine and insert dehydrator plug from new engine or reinstall drain plug.

(2) Through the spark plug openings, spray the valves with corrosion preventive compound, Spec AN-VV-C, or, if not available, introduce a small quantity of engine oil into each cylinder and then rotate crankshaft through several revolutions to insure that the exhaust valves and guides are filmed with oil.

(3) Reinstall either spark plugs or the shipping plugs removed from new engine. Do not leave spark plug holes or oil sump drain hole open.

4. OPERATIONS.

a. Restricted Area. General Order No 90, Headquarters European Theater of Operations, dated 11 September 1944, states: "The airspace above the city of Paris is hereby declared a restricted area. No airplane will be operated below 3,000 feet within such area, except when operationally required."

b. Fatigue. Pilot fatigue must be given careful consideration in planning operations. Some pilots of this command logged over 100 hours during the month of August. Experience in other theaters in the type of flying done by artillery pilots, and experience in other military aviation activities, point to the fact that use of pilots must be restricted and conserved. Results of pilot fatigue do not necessarily show up in easily recognizable forms but in an increasing accident rate, reduction in efficiency and in a reduced ability to evaluate quickly a set of circumstances and react to the dictates of good judgment. Few pilots will admit that they have flown too much during a period. It is believed that by careful evaluation of all contemplated missions with a view to eliminating those which could be accomplished by some other means and by consolidating patrol missions, individual pilot time may be reduced to a minimum of sixty hours per month or lower.

c. Weather.

(1) The arrival of winter weather conditions will bring new problems to Air OP Operations. Expected daily averages and minimums of temperature will warrant certain protective measures for aircraft engines. Insulation of oil sumps with non-inflammable material and closure of the control air intake opening in the engine cowling are advisable as soon as conditions warrant. (In no case will metallic or other shields be affixed to forward edges of cylinder barrels or heads as any modification to existing baffle assembly will disturb the aerodynamic function of the baffles and uneven cooling and "hot spots" within the engine will result.) Pilots should be increasingly alert to recognize signs of carburetor icing. Outside air temperature ranging from plus 20°F to plus 70°F is critical for formation of ice and under certain conditions of low temperature it can be caused in the O-170-3 engine by application of heat. During Air OP operations in September two fatalities were the direct result of engine failure due to carburetor icing.

(2) Sufficient snow to impede operations is not expected during October, November and December, but rain will make some fields too hazardous for take-offs and landings. Hazy cover in some degree is expected to be continuous. Surface winds of intensity sufficient to overturn or damage unmoored aircraft must be prepared for. It is the direct responsibility of all ground crew chiefs to securely tie down aircraft each night.

(3) The following are averages of weather observations made during the past twenty years in the Eastern France - Western Germany region during the months shown:

	Oct	Nov	Dec	Jan
Surface Winds:				
Less than 1 mph	15%	20%	20%	16%
1 - 7 mph	67%	64%	62%	70%
8 - 18 mph	16%	14%	14%	14%
Greater than 19 mph	Occasional in all months			
Winds aloft (1500 feet)				
0 - 15 mph	66%	58%	57%	59%
15 - 31 mph	29%	33%	36%	33%
32 - 47 mph	7%	6%	6%	4%
Greater than 47 mph	2%	3%	11%	3%
Frequency of ceilings 1,000' or less days per month	4	6	6	2
Frequency of bad visibility (1 mile or less at 0700 hours) days per month	7	10	11	7
Precipitation .01" or more (days per month)	9	7	8	8
Snow (days per month)	2	3	3	6
Temperature				
Mean daily minimum (°F)	43	36	30	27
Mean daily average (°F)	51	42	37	37

d. Enemy Antiaircraft Artillery. Following battle lessons are reported by the Artillery Air Officer of the 6th Armored Division:

"(1) Cubs cannot fly higher than tree-top level against mechanically controlled antiaircraft batteries. Every time the Germans shot at us they had us translated for range. Their deflection was off each time, however, and as a result we suffered no casualties.

"(2) The Germans normally fired one 'feeler' round for range and then fired salvos consisting of 3, 6 or 8 rounds.

"(3) The Germans will hold their fire until they are sure you are in range.

"(4) The Germans will follow you to zero elevation and then shoot a salvo of low airs at the point you entered the zero elevation with the hope of catching you on the ground. For this reason you must contour into your field and also stay away from friendly installations.

"(5) The Germans are wise to our principal maneuver, the Diving Turn. When they fire the first salvo it appears as if they then decrease the elevation and fire another hoping that you will execute the diving turn and run into the burst. We found the best evasive maneuver against heavy antiaircraft is an irregular flight path horizontally and vertically away from the gun.

"(6) It is our opinion that Cubs should be flown only as a last resort against positions that have heavy antiaircraft."

e. Operations in Armored Units. Extracts from a discussion of combat operations as submitted by the Artillery Air Officer of the 4th Armored Division:

(1) "Ever since this division started its rapid movements our Cubs have been used to make reconnaissance for the heads of our columns. This has proved to be one of our most useful jobs. We operate on patrol on a common channel, and any unit is free to call us direct for information. This has been especially helpful to the tanks and cavalry. On many occasions we have landed in a field next to the column and taken the Combat Commander up. He was able to weigh the situation in a matter of minutes and issue orders from the plane. This has saved us much valuable time. The pilots have all noticed an increase in the speed of our advance, either on foot or in vehicles, if a plane is near the head of the column, especially if it can get out a short distance in front of the column. One of our big difficulties has been keeping the landing field up with the column. Enemy closed in behind us as soon as the tail of the column passed, making it necessary to move the field often. Also the fact that the second field back from the road often contained enemy limited us greatly in our selection of fields.

(2) "All of the above are a problem peculiar to only armored divisions but I believe that reconnaissance is a job at least as important as our artillery work.

(3) "We have also located many targets for P-47s, and made adjustments on several and marked them for the Air Corps by smoke."

f. Other Types of Missions. 5th Infantry Division reports: "Planes have been used to deliver maps by air to infantry and artillery CPs speeding delivery by several hours. They have been used to take oblique photos of areas for ac attack on these areas. They have corrected dive bombers by the Air Support Party monitoring airplane channel, and radioing corrections to the high performance aircraft...The following are the approximate results of Air OP operations during September:

Enemy guns destroyed	10
Enemy batteries located	61
Enemy batteries neutralized	50
Enemy casualties	Unknown

Generally, most of the Air OP adjustments of fire have been registration and counterbattery. Some adjustments have been made on enemy personnel with excellent effect."

5. ACCIDENTS.

a. Air OP losses, both in aircraft and personnel, have been greatest during the initial operational period of field artillery units. Subsequent losses, although fewer in number, continue in the ratio of one flying accident loss to one enemy action loss. The majority of flying accidents, unfortunately, have been the result of pilot error. It is believed that these accidents are not due to any lack of technique or proficiency of the flight concerned, rather, they are the result of failure to make a correct consideration of the elements and hazards involved in a particular situation. Extracts of Air OP Loss Reports follow:

(1) 5 Aug 1944. A pilot with observer and radio took off uphill toward a hedgerow on a hot afternoon. Aircraft failed to clear hedgerow. Injuries to pilot: Lacerations of head and face, evacuated to hospital. Injuries to observer: Shaken up. Disposition of aircraft: Salvaged.

(2) 7 Aug 1944. Pilot took off with battalion commander on reconnaissance mission. To clear house at end of strip pilot climbed aircraft too steeply, stalled out over house and fell in trees beyond. Injuries to pilot: None. Injuries to observer: Bruises. Disposition of aircraft: Salvaged.

(3) 9 Aug 44. Two pilots and two observers were flying blood plasma to an isolated infantry unit. Planes collided in mid-air and fell in enemy territory. Injuries to pilots: Fatal. Injuries to observers: Fatal. Disposition of aircraft: Destroyed.

(4) 10 Aug 44. Pilot and observer flying on mission collided in mid-air with aircraft from another unit. Injuries to pilots: Fatal. Injuries to observer: Fatal. Disposition of aircraft: Destroyed.

(5) 5 Aug 44. Aircraft struck high tension lines in landing approach. Injuries to pilot: None. Disposition of aircraft: Salvaged.

(6) 13 Aug 44. "...while taking off, aircraft hit a soft spot on the strip, nosed over on its back." Injuries to pilot: None. Disposition of aircraft: Engine and instruments salvaged, remains burned by air section.

(7) 13 Aug 44. Pilot landed aircraft directly behind another plane. To avoid running into aircraft ahead of him, pilot used brakes too strongly, nosed over on back. Injuries to pilot: None. Disposition of aircraft: Repaired.

(8) 15 Aug 44. After making high drag of strip located in field studded with anti-glider poles, pilot made landing approach into wrong portion of field. Right wing struck pole. Injuries to pilot: None. Disposition of aircraft: Repaired.

(9) 18 Aug 44. On landing, pilot dropped plane in from approximately two feet off the ground. Wheels hit soft spot and sank into ground, causing aircraft to nose over. Injuries to pilot: None. Disposition of aircraft: Replaced. Comment: Many an otherwise serviceable airstrip is made dangerous by continued rain.

(10) 20 Aug 44. Pilot landed on bench near MONT ST MICHEL. Wheels sank in soft sand, plane nosed over on its back. Injuries to pilot: None. Disposition of aircraft: Repaired.

(11) 31 Aug 44. Pilot left aircraft while engine was running. In a sudden gust of wind aircraft started moving, flew into hedgerow. Disposition of aircraft: Repaired.

(12) 5 September 1944. Pilot riding in jeep, went out to look for other battalion pilot shot down by enemy action four days previously. Pilot and three others killed by enemy ground troops in ambush.

(13) 28 September 1944. Pilot and observer took off on reconnaissance mission in fog. At approximately 100 feet the carburetor evidently iced up and motor failed. Steep climb caused aircraft to stall out when engine failed. Pilot did not recover from stall, and the plane struck ground nose down. Injuries to pilot: Fatal. Injuries to observer: Fatal. Disposition of aircraft: Destroyed.

(14) 20 Sep 44. Pilot took off on patrol mission. In take-off tail wheel picked up several wires lying on ground and aircraft was dragged down into scrub pines at end of strip. Injuries to pilot: None. Injuries to observer: None. Disposition of aircraft: Repaired.

b. From the above summaries it is evident that with forethought on the part of the pilot and action in accordance with the dic-

Digitized by Google

tutes of good judgment, such accident would have been avoided.

ANNEX NO. 14

C O N F I D E N T I A L

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

22 November 1944

AIR OP BULLETIN)
NUMBER 4)

1. ADMINISTRATION.

a. Personnel Losses. Frequent instances of failure to report loss of pilots or mechanics due to sickness or injury have occurred. All concerned are reminded that losses, either in personnel or aircraft, even though not the result of an aircraft accident, should be reported without delay on Field Artillery Air OP Loss Report. Distribution of report is as previously directed, i.e., original through channels to Commanding General, Twelfth Army Group, duplicate to Artillery Air Officer, this headquarters, triplicate to be retained in unit files.

b. Physical Examination for Flying. War Department Circular No 250, dated 14 June 1944, directs that all field artillery pilots currently on active flying status be given a physical examination for flying (WD AGO Form 64) at least once each year. Physical examinations will be conducted by Army Air Forces flight surgeons or aviation medical examiners upon oral or written request of the field artillery unit commander or unit surgeon. A report, to accompany the November Air OP Operations and Status Report, will be prepared by each field artillery unit and will show the date and place of the last physical examination for flying of each assigned pilot.

c. Equipment in Excess of T/O & E. Certain vehicles and radio equipment in excess of T/O & E were authorized for Air OP Sections to meet operational requirements. For description and allowances of this equipment see letter, HQ TUSA, AG 400.5L GNMCW, subject: "Equipment in Excess of T/O & E" dated 24 July 1944.

d. Changes to T/O & E.

(1) Recent changes to T/O & Es of corps artillery, division artillery and field artillery group headquarters and headquarters batteries provide for the following:

(a) Deleted:

(b) Authorized:

	Item	Allowance
1.	Mechanic, army airplane and engine (747) Tec 5	1
2.	Helmet, flying, summer, type AHH-15	3
3.	Helmet, flying, winter, type AN3-1c, or helmet, flying, intermediate, type A-11	3
4.	Kit, interpreter, photographic, type F-2	1
5.	Tent, command post, complete (w/ pins and poles) for airplane maintenance	1

(c) Changes authorizing above additions are enumerated below:

1. Corps: CL to T/O & E 6-50-1, 7 Aug 44.
2. Inf Div: CL to T/O & E 6-10-1, 16 Jun 44.
C5 to T/O & E 6-10-1, 26 Jul 44.
3. Group: C5 to T/O & E 6-12, 7 Aug 44.

(2) Changes to T/O & E of headquarters and headquarters battery of 105mm howitzer battalion, 155mm howitzer battalion, or 4.5-inch gun battalion, provide for the following:

(a) Deleted:

1. Ground crew helper, Pvt SSN 521.

(b) Authorized:

	Item	Allowance
11.	Mechanic, army airplane and engine (747), Tec 5	1
2.	Helmet, flying, summer, type AHH-15	2
3.	Helmet, flying, winter, type AHH-1c	2
4.	Kit, photographic, interpreter, type F-2	1

(c) Changes authorizing above additions are enumerated below:

1. 105mm howitzer battalion: CL to T/O & E 6-26, 16 Jun 44.

2. 155mm howitzer or 4.5-inch gun battalion: C6 to T/O & E 6-36, 16 Jun 44.

e. Materiel Status Reports. Some units have included reports on current status of AAF equipment of air OP sections in the Monthly Materiel Status Reports required by letter this headquarters, AG 400 (5-3) SHCCB-J, subject: "Overseas Supply Reports", dated 8 April 1944, as amended by letter this headquarters, same file and subject, dated 12 June 1944. Information on air force equipment is not required in these reports.

f. Air OP Slides Card. Use of Unit Card #1 as an Air OP Slides card for all Army units is contemplated. This card contains only numbers, letters of the alphabet, "Switch on", and "Switch off", thus making 192 squares which can be filled in with appropriate words. It is desired that corps, division, brigade and group artillery air officers submit by informal memorandum to the Artillery Air Officer, this headquarters, a list of terms that they consider should be included on this Slides card, so that a comprehensive and usable card may be prescribed for Army wide use.

2. ENGINEERING, SUPPLY AND MAINTENANCE.

a. Supply Procedure.

(1) Items of AAF equipment for Artillery Air OP sections

DECLASSIFIED

DECLASSIFIED

Digitized by Google

will be obtained only from the 43d M R & R Squadron.

(2) Exchange of unserviceable AAF equipment may be made direct at M R & R Squadron by Corps, Division, Brigade and Group Artillery Air Officers or their representatives, or by pilots of battalions which are not attached to a Corps, Division, Brigade or Group headquarters.

(3) Requisitions for equipment other than that procured on an exchange basis will be made on AAF Form 1c in triplicate, using blank paper for duplicate and triplicate copies. Basis for requisitions will be either initial issue, replacement or combat losses, or quotation of specific authorization. The requisition will be signed by the Corps, Brigade, Division, group or separate battalion air officer, and will bear the following certificate: "It is hereby certified that the foregoing items represent shortages of authorized equipment and that the quantities shown are not in excess of authorized allowances." Requisitions will be made on the 43d M R & R Squadron and sent through the Army Artillery Air Officer for approval. For additional requirements on requisitions for winter flying clothing see paragraph c e below. Notification that supplies or equipment are ready for pick-up at the M R & R will be given to unit concerned by the Army Artillery Air Officer.

(4) All requisitions on 43d M R & R Squadron dated prior to 1 October 1944 for any class of authorized AAF equipment on which delivery has not been made as of this date will be considered void. Units will submit new requisitions in accordance with the provisions of paragraphs (1), (2) and (3) above.

b. Cold Weather Operation of Engines.

(1) With the arrival of winter weather, all pilots and mechanics should attach increasing importance to engine warm-up procedure. Cold oil circulates poorly and operation of cold engines in excess of 1200 RPM causes excessive wear and increased maintenance. When possible, warm-up should consist of the following:

(a) After starting engine, operate for at least four minutes at 700 - 800 RPM.

(b) Increase RPM to 1100 - 1200 and continue warm-up until indicated oil temperature commences to rise.

(c) Increase RPM to 1400 - 1500 for two minutes, after which magnetos may be checked and engine run up.

(2) Protracted glides should be avoided as the combination of cold outside air and V-80 fuel causes engines to load up easily. Descents should be made with partial throttle when possible, or frequent clearing of engine with good strong application of power. At least one recent accident was caused by engine failure directly attributable to engine loading up.

c. Oil Sump Insulation. A non-inflammable material for heat insulation of oil sumps, lines and air heater assemblies and tubes is being procured and will be available in the near future at the M R & R Squadron. Notification of its availability will be given units by the Army Artillery Air Officer.

d. Snow Skis. To provide for emergency operation of field artillery aircraft in the event of unusual snow conditions, a number of sets of skis for L-4 aircraft have been ordered. Delivery has been deadlined for 1 January 1945. Further information on availability and issue will be forthcoming.

e. Winter Flying Clothing. Authorization of winter flying clothing for artillery air observers on flying status has been requested. Pending publication in the very near future of instructions on requisitioning procedure, further requisitions for clothing should be held in abeyance.

f. Plexiglas for side windows. One-eighth inch Plexiglas or Lucite is being made available for installation in door and left side windows of L-4s to replace the present poor quality windows. This material will greatly improve visibility for observers but does not have as good shatter-proof qualities as the old transparency. As only small amounts of the stock become available at a time, the Army Artillery Air Officer will coordinate its installation. Units desiring the installation will so notify the Army Artillery Air Officer, who will indicate a date upon which aircraft of that unit may be flown to the M R & R Squadron for the necessary work.

3. OPERATIONS.

a. Flight Operations. The following information on Air OP Flight Operations has been compiled from the records of three months of combat operations. It is presented here as a means of acquainting all pilots with the scope of Air OP activities in the Army as well as for the lessons that may be learned from a study of past operations.

(1) Pilots flying time.

(a) August. The average flying time per pilot during the month of August was 48.4 hours. Fifty per cent of pilots in the Army flew between 36 and 62 hours. The highest flying time reported was 100 hours, the lowest 4 hours. 10,660 missions were flown averaging 59.1 minutes per mission.

(b) September. The average flying time per pilot during the month of September was 45.6 hours. Fifty per cent of the pilots in the Army flew between 38 and 54 hours. The highest flying time reported was 140 hours, the lowest 4 hours. 8,872 missions were flown averaging 60.6 minutes per mission.

(c) October. The average flying time per pilot during the month of October was 36.7 hours. Fifty per cent of the pilots in the Army flew between 27 and 45 hours. The highest flying time reported was 69 hours, the lowest 4 hours. 6,866 missions were flown averaging 65.5 minutes per mission.

(d) Excessive time. Flying time in excess of 70 hours was reported by 37 pilots for the month of August, and by 13 pilots for the month of September. No flying time in excess of 70 hours was reported for October.

(2) Air OP Losses. For purposes of this report, losses are defined as any damage to an aircraft necessitating replacement or repair by the M R & R Squadron. Fifty-one per cent of all losses are attributable to pilot error, 39.4 per cent to enemy action, and the remaining 9.2 per cent to miscellaneous causes such as engine failure, structural failure or unknown causes. During this period, one aircraft was destroyed in flight when struck by an artillery shell. No aircraft have been lost to friendly antiaircraft fire.

Operational Losses	Per cent of total losses
Takeoff (pilot error)	22.4
Landing (pilot error)	17.3
Ground handling (pilot error)	4.1
Other (pilot error)*	7.1
Engine failure	4.1
Structural failure (not in flight)	2.1
Total operation losses	57.1
Combat losses	
Enemy aircraft while in flight	9.2
Enemy ground fire while in flight	17.3
Enemy aircraft while on ground	5.0
Enemy ground fire while on ground	10.2
Friendly ground fire while in flight	1.1
Other**	2.1
Total combat losses	42.9

*Unclassified pilot error losses include four aircraft destroyed and one damaged in mid-air collision, one aircraft landed in enemy territory and abandoned, and one aircraft destroyed in a crash resulting from a tailspin.

**Unclassified combat losses include two aircraft that failed to return from combat missions. Cause unknown.

b. Night flying. Night operation of Air OPs is not favored by this headquarters for the following reasons.

(1) Involved coordination is necessary with both night fighter units and antiaircraft artillery units and identification procedure of these units would be disrupted by night flying L-4s.

(2) Extensive preparations and special facilities are necessary.

(3) Weather during the winter months will rarely approach the perfect conditions necessary.

(4) Hazard to pilots and observers not trained for night flying is not justified by operational necessity.

c. Battle Lessons and Experiences. That tactics and technique of field artillery air observation methods are still being developed is evidenced by the commendable submission in Monthly Operations and Status Reports of hitherto unpublished information, ideas, and unusual experiences. Although certain of these may not necessarily be applicable to all situations, all are the result of combat operations and will be published herein for careful consideration by all Air OP personnel. Reports of corroborative or contrary experiences are particularly desired in order that the validity of the indicated battle lessons may be determined.

(1) "A word of warning to the wise concerning selection of fields. Many units selected fields in our last operation that did not afford all weather operation. Not realizing that the situation would become so stable they suddenly found themselves bogged down when it started raining. A few accidents can be attributed to the fact that some fields were too short and too soft. It was also found that vehicles should not be allowed to drive all over the landing strip as the ground becomes cut up after a few times which ruins the field. A dismount point should be used." - Artillery Air Officer, XII Corps.

(2) "During the rainy season keep all vehicles off the field and taxi strip. The ruts destroy the field and strip." - 696 Armd FA Bn.

(3) "Many times the enemy will not fire his artillery while we are in the air. However, when making a turn, we have noticed gun flashes many times and have been able to locate them. The enemy evidently believes we are blind during a turn." - 282 FA Bn.

(4) "Advantage found in having observer face to the rear due to the fact that he can spot enemy machine gun emplacements when they fire at the plane while we are getting away from the fire." - 945 FA Bn.

(5) "While firing mission in our sector on or about 20 October 1944 noticed Cub flying in our direction, about five miles away. Upon passing us both pilot and observer were looking in direction of target area, having no knowledge of anyone else being in the air." - 278 FA Bn.

Note: Four pilots and three observers have been killed in mid-air collisions in Third US Army operations.

(6) "The enemy is evidently going back to his old trick of allowing a Cub to fly over an area without being fired upon, and then when the pilot has gained confidence in the safety of the area, unexpectedly opening fire. He will also fire flak into a certain spot on the area, and then wait for a Cub to fly through that area." - Artillery Air Officer, 5 FA Gp.

(7) "It has been found that enemy artillery becomes active during the hours when daylight is just breaking and at dusk in the evening. At these times gun flashes can be seen best by Air OPs. To take advantage of this, air OPs begin operations as soon as possible in the morning and stay up as long as light permits in the evening, noticing suspected enemy battery locations. Many counterbattery missions have been successful by use of this procedure." - Artillery Air Officer, 80th Infantry Division.

(8) "A form of flash warning for enemy artillery or mortar fire is being used with good results. The message originates with the forward observer, goes by radio direct to Battalion CP then to Air OP. Message is brief and gives coordinates of point where shells are falling to nearest 500 yards and the suspected direction of the enemy battery. The Air OP then has a direction in which to look, and can sometimes pick up the enemy battery before the concentration is completed." - Artillery Air Officer, 80th Infantry Division.

(9) "Experience in this headquarters has shown that grouping and close coordination among local field artillery units has resulted in a more efficient coverage on this front. Pilots have flown less hours and on a definite schedule thus enabling the section to coordinate time and repairs. What is most important is the control of traffic along the front. On many occasions the sky along the front has become dangerously cluttered with L-4s. As many as ten Cubs have been noted flying in an area which should allow no more than three." - Artillery Air Officer, 183 FA Gp.

(10) "The German antiaircraft adjust on clouds and shoot at Air OPs that fly near them. They shoot at two planes that are close together quicker than they will at single planes. They do not shoot at planes if they are just flying up and down the front. They do shoot if the plane starts making short circles as if it was looking at one point or preparing to adjust." - Artillery Air Officer, 4th FA Gp.

4. ACCIDENTS.

a. Enemy Artillery Fire. On 2 October 1944, four aircraft of one FA group were destroyed on the ground by enemy artillery fire from FORT DRIANT. Approximately 100 rounds fell during the hour and thirty

Digitized by Google

minutes shelling and crews were unable to evacuate the aircraft. Effective accuracy of the fire was possible because the landing strip was not defiladed and the enemy had excellent observation.

b. Friendly Artillery Fire. The problem of avoiding the trajectories of friendly artillery and mortar fire, under present conditions of masses of artillery on a continuous front, has not been solved. The coincidence of flight paths of aircraft and shells, although rare, has occurred five times, twice fatally, in this command. In some instances shells have struck aircraft without detonating.

ANNEX NO. 15

CONFIDENTIAL

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

AIR OF BULLETIN)
NUMBER 5)

8 January 1945

1. ADMINISTRATION.

a. Flying pay for observers. Regulations governing flight pay, qualifications for flight duty, and flight requirements have been collected and published in War Department Technical Manual 12-250, dated 1 March 1943. Bulletins 28 and 30, War Department, 1942, specify that flying pay for field artillery Air OP observers (non-flying officers) is a flat sum of $60 a month.

b. Renewal of observers flying status.

(1) Requests for renewal of orders requiring officers and enlisted men to participate in aerial flights should be submitted to the Commanding General, European Theater of Operations, through the headquarters, attention: Artillery Officer. Each such request will contain the name of the officer or enlisted man concerned and will cite the order which currently requires him to participate in aerial flights as a field artillery aerial observer.

(2) Initial recommendations for placing field artillery aerial observers on flying status or requests for substitution of aerial observers will continue to be prepared and submitted through command channels in accordance with the provisions of Letter, Headquarters Twelfth Army Group, 373.2 (Arty), dated 21 August 194_, subject: "Orders requiring participation in aerial flights", and 1st Indorsement thereto, this headquarters, dated 15 September 194_.

2. ENGINEERING, SUPPLY AND MAINTENANCE.

a. BA 39 and BA 40 batteries. Periodic checks of radio batteries are necessary to prevent radio failure in flight. Voltage tests give an indication of the useful remaining life of batteries. To check the BA 39 battery, which supplies power for the transmitter, place panel switch in "Plate" position. To check the BA 40 battery, power source for the receiver, place panel switch in "Fil" position. Batteries should be replaced when the panel meter indicates less than "20". The BA 39 is in use only when transmitting and has a correspondingly longer life. Design of the SCR 500 and SCR 609 precludes any voltage drain on the batteries when the switch is off. However, dirt and moisture on the battery and microphone plugs or in the microphone switch can cause slight leakage of current. Plugs must be kept clean and batteries should be disconnected when radio is not in use.

b. Drain grommets. Condensation and freezing of moisture within wings and fuselage of aircraft with consequent alteration of flying characteristics may be expected during winter if drain grommets in the trailing edge of wings and tail end of fuselage are not kept open. Periodic checks of these openings should be made and all dirt and mud removed.

c. Snow on wings. Wings of L-4 aircraft standing on the ground will not withstand the stress imposed by some snow loads that may be expected to fall during the coming months. Sufficient snow may fall during one night to cause collapse of unsupported wings. Simple props to be used beneath wings at the lift strut fittings must be made available for use when necessary. Alert crews or guards should also remove snow as it falls during heavy storms.

d. Wind damage to a raraft. During a two-week period from 20 November to 4 December nine aircraft of Third US Army units were damaged or destroyed when they were torn loose by high winds from inadequate or non-existent moorings. These results indicate that insufficient precautions are being taken against the unusual weather conditions prevailing during winter months. In some instances 3-foot mooring stakes were pulled out of soft ground by repeated jerks caused by strong gusts. Darts of the D-1 mooring kit in some cases were inverted and pulled out of the ground by the unusual force of the wind. Experience has proven the following methods necessary:

(1) Moor aircraft tail into the wind.
(2) Tie control stick forward.
(3) Keep tie down ropes snug.
(4) Do not use the type D-1 rods and darts in muddy ground ground or during strong winds.
(5) Engineer wire entanglement stakes of the corkscrew type should be procured for each aircraft. They are readily inserted or withdrawn from the ground and will withstand tensions which pull up type D-1 rods or other wood or metal stakes.
(6) Always tie down an aircraft when it is left alone.

e. Frost on wings. The aerodynamic efficiency of an airfoil is altered when its shape or the character of its surface is altered. A coating of frost or ice on wings or propeller may speedily render an aircraft incapable of flight. Frost on wings so roughens the surface as to interfere with the smooth flow of air over the wing and lift drops sharply. During the present cold weather season three aircraft of this command crashed immediately upon takeoff because of frost or ice coated wings. Material is now being procured for use in making wing covers to keep off frost and snow so that aircraft may be immediately ready for flight at any time.

f. Records to accompany aircraft. When an aircraft is transferred, detached on temporary duty to another unit, or returned to the M R & R Squadron for major or minor repairs, all forms and records will accompany the aircraft. These forms and records include Forms 1 and 1a, 41b, 60a and 60b, and 61. Their presence with the aircraft is necessary for the availability of previous flying time, maintenance, and operational information; and recording of additional inspections, maintenance or repair concerning the aircraft and engine.

g. Engine failure. The danger involved in an engine failure on takeoff is recognized by all pilots. Such failures are primarily due to freezing temperatures, and two of the possible causes have been ascertained. These two causes are not apparent during starting and warm up, but become evident during full throttle operation of engines. Water in gasoline will freeze and partially close the line between tank and gascolator bowl. This results in a metered flow of fuel which will not support full throttle operation longer than a few seconds. Precautions: Run engine at full throttle at least one minute before takeoff. A second cause of engine failure is vacuum lock in the fuel tank. Consumed fuel is replaced by air entering through the gas tank cap. Ice or snow sometimes freezes around the gas cap and prevents entrance of air into the tank. Although the fuel gauge may rise and fall normally, thereby showing that the cap is not frozen fast, the ice effectively seals the passage and air cannot enter the tank. When the hydrostatic pressure is equalled by the vacuum in the fuel tank gasoline ceases to flow to the carburetor and failure results. Precautions: Check for presence of ice in or around gas cap, run engine at full throttle for one minute before takeoff.

h. Exchange of propellers. Continued use or exposure to weather will sometimes warp or twist the blades of propellers to the extent that the pitch is altered sufficiently to reduce maximum RPM of the engine. When it is desired to exchange such "slow" propellers the aircraft will be flown to the M R & R Squadron, where the inspection and exchange will be accomplished.

3. OPERATIONS.

a. Battle lessons and experiences. The following extracts from Air OP Operations and Status Reports for November are reproduced for the contribution they may make to the combat wisdom of both pilots and observers.

(1) "A probable fatal accident was averted by the use of flare and flare gun when pilot, sent on a late mission, lost way on return to a new strip after his adjustment of fire. Many times Cubs return to strip with too little daylight margin. We believe a flare run and flares issued to each separate battalion is a good military investment for the prevention of accidents caused by aforementioned circumstances." - CO, 284th Field Artillery Battalion. (Comment: Consideration must be made of possibility of revealing location of airstrip to the enemy through use of such signals.)

(2) "About ninety per cent of all adjustments made from the air by this battalion on enemy artillery installations were located in a small group or groups of trees that do not show on a 1/50,000 scale map." - Air Officer, 278th Field Artillery Battalion.

(3) "Shellreps may be taken fairly accurately from the air." - Artillery Air Officer, 410th Field Artillery Group.

(4) "The Artillery Air Officer of this headquarters, after a recent inspection of air sections operating under Corps Artillery, found that over 80 per cent of aircraft inspected had not had compass corrections made since the aircraft were assembled at Mobile Reclamation and Repair Squadrons." - Artillery Air Officer, III Corps.

(5) "The III Corps Artillery Air Section has for over a week's period used a hard surface road for an airstrip. Muddy fields have hampered our artillery Air OP operations considerably during the last month. The use of a hard surface road for operation has proven excellent. Our planes have well camouflaged positions on the road sides and can quickly be taxied to the road strip. The use of this road has given us an all-weather strip and we have found that maintenance has almost been cut in half as we no longer have to pull wheels and clean brake drums weekly, or clean pyralin and fabric after every flight, or clean the mud from the air filter daily. Our use of the road has not tied up normal traffic operation for periods exceeding three minutes." - Artillery Air Officer, III Corps.

(6) "Be extremely careful in selection landing strips and mooring of airplanes. This Group has had two airplanes damaged by poor fields and one by poor moorings." - Artillery Air Officer, 410th Field Artillery Group. (Note: This report is typical of others submitted by units facing a common difficulty.)

(7) "A liaison pilot of the 195th Field Artillery Group claims to have flown farther into Germany than anyone else in a like type of aircraft. Losing his way in the haze and fog he flew to a point some twelve or fifteen miles behind the enemy lines.

"The pilot took off from the group airstrip in the vicinity of THIONVILLE (9685) at 2130, 5 November on a routine displacement to the new airstrip near EVENDORFF (0459). Because of poor visibility he was flying a compass course instead of using landmarks. Some twenty-five or thirty minutes later he decided he had passed his check point and...was lost. Attempting to orient himself he lost altitude and circled through a clearing in the haze and fog and saw below a sizeable city on a river. Thinking it was a Moselle River city he continued to circle until he was greeted by a volume of antiaircraft fire. He dodged and banked to miss the fire and headed east to get protection over a large woods. The town he had seen later proved to be BESSENBERG (1690BC) and the river the SAAR.

"Still flying east at the 1500-foot ceiling he tried to orient himself, but the 1/50,000 Thionville sheet map...wouldn't fit the terrain and ground features below. He continued to fly east until he saw a railroad (2595) and then decided upon a southward course over the open country, trying to avoid centers of population. During this time he contacted...the Group Air Officer and reported his situation. From this time on he was in constant contact by radio with the Group Air Officer and described, as he flew along, the terrain features and landmarks. By studying his map on the ground the Air Officer decided the last Cub must be east of the SAAR River, but about this time the pilot was more interested in dodging the lively reception given him by German antiaircraft gunners located in MERZIG (2059) and MERCHINGEN (2359).

"Upon sighting and reporting the prominent 'Y' east of the SAAR River (2518) his exact location became evident to the Air Officer, who guided him back into friendly territory. He first sighted American Armor in SCHWEINDORFF (1598) and landed on an artillery airstrip near MALSTATT (0798) a very relieved and lucky pilot. He had been in the air for over two hours and had flown over enemy territory at least half the time.

"Battle lesson: When flying over enemy territory avoid populated areas, stick to the woods and open country. When flying through small arms fire and ack-ack, change course and altitude often. Be sure your radio and compass are in good working order at all times." - Artillery Air Officer, 195th Field Artillery Group. (Comment: This

Digitized by Google

unconventional homing method saved both pilot and aircraft from loss or capture and reflects well deserved credit upon both Air Officer and pilot for their initiative and presence of mind in a highly unusual situation.)

(d) "Flew supplies to infantry, and evacuated wounded from position isolated behind enemy lines (347 missions)." - Artillery Air Officer, 95th Infantry Division.

(e) "Necessary to supply troops assaulting Fort EISENHOWER (during flooding of Roer River). Suits dropped about 5000 pounds of supplies to infantry assault battalion. Of these supplies 1500 pounds were a high explosive compound, fuses and detonators to be used in blowing doors and pillboxes. Rest of supplies was food, blankets, radio batteries, medical supplies and maps with a plan of the fortress. All flights were made at housetop height over the town of BASSENHEIM, about one-third of this town was in enemy hands at the time the flights were made. Two reasons made it impractical to fly higher, first, the explosives had to be dropped from a low altitude to keep them from exploding, second, the fortress was protected by 20mm antiaircraft. We found the guns could not be depressed sufficiently to attack the ships when they were hedgehopping." - Artillery Air Officer, 90th Infantry Division. (Comment: Although no losses were incurred this was a hazardous operation and should be attempted only when all other means fail. Although the antiaircraft defenses mentioned above were ineffective other 20mm antiaircraft installations are not necessarily subject to like limitations.)

b. Selection of airstrips. Unnecessary exposure to a variety of hazards through injudicious selection of airstrips has been a major contributing factor to the total of aircraft destroyed or damaged recently. Flying accidents, due in large part to inadequate or dangerous airstrips, and enemy artillery fire have caused losses which preclude the maximum employment of Air OPs demanded by current operations. Procurement of replacement equipment is expected to be increasingly difficult. To reduce avoidable losses the following considerations must govern the selection of airstrips.

(1) Airstrips must be adequate. Pilots landing and taking off in overloaded aircraft in sometimes difficult flying conditions should not be confronted with a field that is either too small, too wet or muddy, unmarked with ponds, obstructed by fences, trees, ditches or holes, laid out on a difficult slope, or one which has a constant cross-wind. It is appreciated that available fields meeting such specifications are difficult to locate but failure to improve established fields by removing obstacles and reducing other hazards can not be condoned. Fences and trees adjacent to the strip should be removed when advisable, and holes filled in.

(2) Air OP installations are high priority targets for enemy artillery. Loss of nineteen aircraft of Third US Army units to enemy artillery or mortar fire is ample evidence of the necessity for reduction of this hazard. Defilade of the airstrip and dispersion of the aircraft must be consistent. Some losses occurred from stray rounds incidental to the shelling of other targets adjacent to the airstrip. Do not locate near bridges, towns, crossroads, or other likely targets.

(3) A once long dormant Luftwaffe is no guarantee of freedom from air attack. The activity of the GAF is unpredictable, and recent attacks in force are possible of repetition in other areas. Standards of camouflage and concealment, and efficiency of local defense measures have long been permitted to deteriorate. A well located, properly prepared machine gun must be constantly ready for aggressive use.

(4) Proximity to the unit CP must be of secondary importance to the requirements listed above. The consequent difficulties of communication, messing, shelter and supply which may be involved must not influence the selection of an airstrip to the extent that aircraft and personnel are in constant jeopardy. When safety exists only to the rear then airstrips should be so located. It is not desired to restrict the aggressive employment of Air OPs; however, conservation by all possible means of both pilots and aircraft has become necessary, in order that the new indispensable function of the Air OPs continues undiminished.

ANNEX NO. 16

CONFIDENTIAL

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

AIR OP BULLETIN) 27 January 1945
NUMBER 6)

1. ADMINISTRATION.

a. All artillery Air OP pilots should be given an opportunity to read these bulletins.

b. Special report on observers. It is desired that a separate report, to accompany the monthly Air OP Operations and Status Report for January, be submitted by each unit showing the serial observers who are currently on flying status or observers for whom flying status has been requested. Report will show name, rank, and serial number of each officer or enlisted man concerned, the period of flight status authorized, and the file number of the orders which authorized such status. The following example is furnished:

1st Lt John C. Smith, 0111111, FA From 1 January - 30 June 1945, per letter, Headquarters ETOUSA, subject: "Orders", file AG 300.4 (20 Jan 45) ML55, dated 20 January 1945.

c. Distinctive marking of aircraft.

(1) Pursuant to directive contained in change 5 to Operations Memorandum Number 15, Headquarters European Theater of Operations, United States Army, distinctive markings (black and white stripes) will be removed from all field artillery and liaison aircraft of this command at the earliest practicable date. Subordinate headquarters will not prescribe any markings for field artillery or liaison aircraft. Should there be a requirement for distinctive markings, application will be made to Supreme Headquarters Allied Expeditionary Force through this headquarters.

(2) The removal of these distinctive markings in no way affects the presently prescribed national markings, which will continue to be carried on aircraft.

(3) Aircraft of Allied manufacture may be seen with or without distinctive markings (black and white stripes); this does not necessarily indicate that the aircraft is hostile.

d. Status of mechanics. Recent changes to T/O & Es of headquarters and headquarters batteries of corps artillery, division artillery, field artillery groups, 105mm and 155mm howitzer and 4.5-inch gun battalions have deleted the air section ground crew helper and substituted therefor an airplane and engine mechanic (747) in the grade of Technician Fifth Grade. (See Air OP Bulletin Number 4, dated 24 November 1944.) Similar changes for heavy battalions have not as yet been received. When the formerly authorized ground crew helper (591) has become proficient through practical experience in all the duties of an airplane and engine mechanic (747) and is considered competent by the artillery air officer, this military specialty should be entered on the Soldier's Qualification Card. In this regard see War Department Circular Number 20, dated 17 January 1944. Successful completion of prescribed course of study at any army service school is not a prerequisite to a rating of airplane and engine mechanic (747) if the necessary proficiency has been attained through practical experience. Assistant mechanics who have been rated 747 will be shown on the Air OP Operations and Status report as such even though they may not hold the grade of Technician Fifth Grade authorized.

2. ENGINEERING, SUPPLY AND MAINTENANCE.

a. Winter oil. Temperatures experienced thus far and to be expected this winter do not justify the use of an engine oil lighter than 1065. Non-detergent aviation oil of proper winter grade is available at the 424 Mobile Reclamation and Repair Squadron; procurement of oil from other sources is not advisable. Quartermaster POL dumps stock only detergent oils (which dissolve the paint lining of the continental C-170-5 crankcase), and non-detergent oil obtainable from other depots may be of improper viscosity.

b. Cold weather starting suggestions.

(1) Two men, one at propeller, second at controls.

(2) With switch off, pull engine through eight compression strokes, priming meanwhile.

(3) Advance throttle slightly just before starting.

(4) Continue priming after engine is started until smooth operation is obtained. Caution: Have fire extinguisher handy.

(5) Ice may foul the gaps of spark plugs and prevent starting altogether. For this and also a simple engine heater see subparagraphs (2), (3) and (6), under "Battle Lessons and Experiences".

c. Additional signal equipment. SCR 593 radio receivers have been made available for issue to headquarters and headquarters batteries of corps, brigades, airborne, armored and infantry division artilleries, and field artillery groups. The receiver is to be used to monitor the AAA enemy aircraft warning nets. Instructions for procurement of these sets are contained in Circular Number 5, this headquarters, dated 20 January 1945.

d. Extract from Field Artillery and Tank Destroyer Summary Number 15, Ninth US Army, dated 15 January 1945 -- "The Artillery Air Officer, XIII Corps Artillery, has reported the following method of snow and ice removal from aircraft wings and tail surfaces: 'Attach a hose to the exhaust of a motor vehicle. Remove two inspection plates from wing. Insert the hose in one of the inspection holes. The circulating warm air not only melts the ice but leaves the surfaces dry. If an attachment to the hose to "spread out" the warm air can be fashioned, direct application to the surfaces will also be successful in accomplishing the task quickly.'"

e. Aircraft cleaning. Oil, or a mixture of gasoline and oil will not be used as a cleaning agent to remove dirt and mud from dope and fabric surfaces. Surfaces so treated become softened, lose their resiliency, and the fabric is slowly rotted. After a period of such deterioration recovering of the aircraft becomes necessary. The interiors of aircraft often accumulate an unnecessary additional cargo of discarded maps, loose tools, ropes, hand grenades, dirt, etc. The additional weight carried and the possibility of aileron control jamming by loose objects is good reason for periodic inspection and clean-up.

f. Air Corps supplies to artillery units. Headquarters Ninth Air Force Service Command has instructed Headquarters 2d Advanced Air Depot Area that Air Corps supplies will not be issued direct from depot groups to artillery units without a written request from the appropriate mobile repair and reclamation squadron or from the appropriate Army Artillery Air Officer. For proper supply procedure see paragraph 2 a, Air OP Bulletin Number 4, this headquarters, dated 22 November 1944.

3. OPERATIONS.

a. Battle lessons and experiences.

(1) The following report from a field artillery group is reproduced for the excellent exposition it makes of the advantages of a system whereby all air observation sections come under close operational supervision of the Group Air Officer.

"The CO of this headquarters has instituted a plan which has shown excellent results for a period of one month's operation.

"The CP tent is installed on the field, complete with stove, and is used as an immediate headquarters for pilots and observers. (In this weather, the tent and stove are a must.) Inside the tent is a bulletin board on which are kept an operations map and all latest G-2 and air information data. Pilots and observers inspect the board and map before each flight and return after each flight to leave a written report of their observation.

"An operations man is kept on duty in the tent and has the job of briefing the pilots on the situation, both enemy and friendly. He keeps flight personnel advised of the organization for combat. He keeps an overlay of the front lines, unit boundaries, and gun positions with their lateral limits of fire. All enemy information is kept on this map too. As a result, each pilot and observer takes his flight with complete and late knowledge of the situation and can more intelligently observe and shoot.

"The operations man keeps close liaison with Group S2 for S-2 and S-3 information.

"I believe that this system will alleviate one of the major troubles of the Air OP. Air sections are normally far removed from their CPs and personal contact for pilots and observers is too often lost. Losses in Air OP have been the result, in many cases, of ignorance of the situation. Pilots must know where the front lines are,

Digitized by Google

the plan of attack, and the mission of the battalion, those sections of the front where enemy activity with small arms and AA is apt to be heaviest, and information of the enemy's capabilities in his terrain.

"Given this information, the Air OP can fly with a marked degree of improved observation and safety." -- Air Officer, 183d Field Artillery Group.

(Comment: This plan presupposes the use of a common airstrip by all aircraft of the attached battalions. Many units employ a similar or modified version of the organization outlined above. Additional advantages are better control and coordination of the use of aircraft, pooling of facilities, and closer supervision of aircraft maintenance.)

(2) "If planes won't start after a cold damp night check the spark plugs for formation of ice in the gaps. One morning all eight plugs on one engine would not fire due to ice formations in the gaps." -- Air Officer, 965th Field Artillery Battalion.

(3) "Preheating of engine utilizing vehicle exhaust fumes reduces cold weather starting difficulties." -- Air Officer, 512th Field Artillery Battalion.

(4) "It has been found that by using the fine meshed tank camouflage net instead of the regular truck camouflage net formation of frost on the wings and control surfaces can be abolished. This facilitates preparation of planes for early morning flights and reduces the danger of accidents due to frost (on wings)." -- Artillery Air Officer, 5th Infantry Division.

(5) "Aluminum welding rod used as a gas gauge will not rust and has been found to be more satisfactory than the factory installed gauge in the L-4H airplane." -- Air Officer, 204th Field Artillery Group.

(6) "Due to the low temperatures encountered recently, the water that gets into the fuel tank from condensation, etc., will freeze and choke off the fuel to the carburetor. This was experienced three mornings before the cause was determined and each time the tank was drained but some of the ice remained. The mechanic was able to thaw the fuel system out thoroughly by connecting a piece of hose to the exhaust of a vehicle and playing the hot exhaust gases along the fuel tank and fuel lines until all traces of water and ice were gone. By carefully straining all fuel as it is used and keeping the tank full we hope to minimize the amount of water that collects in the fuel system... Airplane gave trouble with symptoms of icing up during flight. A forced landing was avoided by applying carburetor heat immediately and pumping fuel in to the engine by rapid strokes of the primer before the propeller stopped windmilling." -- Air Officer, 204th Field Artillery Battalion.

(7) "It is becoming more difficult to pick up enemy guns by their flash, however, we have picked up some guns by their smoke rings rising behind woods and tree lines on calm days. The enemy appears to be using more decoys for his artillery, requiring us to fly higher in an effort to pick them up. When flying at comparatively high altitude, it is extremely important that Air OPs get flash warnings of all enemy aircraft in vicinity." -- Air Officer, 252d Field Artillery Battalion.

(8) "SCR, radio hookup with local AAA gives excellent enemy aircraft warning. All aircraft should operate on common channel and acknowledge receipt of warning before they 'hit the deck'." -- Air Officer, 195th Field Artillery Group.

(9) "We have found that when firing on snow covered terrain the observer can find his first round more easily if a round of high burst is fired." -- Artillery Air Officer, 6th Armored Division.

1. ADMINISTRATION.

* * * * * * * * * * *

2. ENGINEERING, SUPPLY AND MAINTENANCE.

* * * * * * * * * * *

3. OPERATIONS.

a. Battle lessons and experiences.

(1) "The SCR-593 radio, recently authorized to corps, division and group headquarters has a definite latent communication value to air sections of these units. The 'A' channel affords a direct contact with the AAAIS enemy aircraft warning system. This channel is of instant value to the plane and eliminates the inevitable 'middle man' and delay which can be dangerous.

"The 'B' channel can be lined up on an SCR-193 frequency and is a big step in long-range communications for air sections. It is realized that the SCR-577 is a receiver only. This fault is minor when it is realized that emergency messages or orders can be sent back to air sections, left behind and out of 500-600 series radio range, for distances as great as twenty miles. This group has often made displacements of twenty miles and communication and liaison is lost, adding confusion to the abandoned section. Now we have control and even though it is a one way affair, it is a big improvement over nothing at all." - Artillery Air Officer, 183d Field Artillery Group.

"We have installed an intercommunication system in our planes and now consider interphone almost indispensable." - Artillery Air Officer, 5th Armored Field Artillery Group.

(2) "During the past month one of our pilots had an accident at another artillery field. The pilot was hospitalized and our battalion was not notified until sixty hours later. When pilot did not return that night we assumed that he was either lost or had a forced landing. Due to the fact that we were not notified, the division and group planes spent one and one half days searching for the plane...When an accident occurs on another field, I believe it is the responsibility of the senior officer of that field to notify the unit concerned as soon as possible." - Air Officer, 696th Armored Field Artillery Battalion.

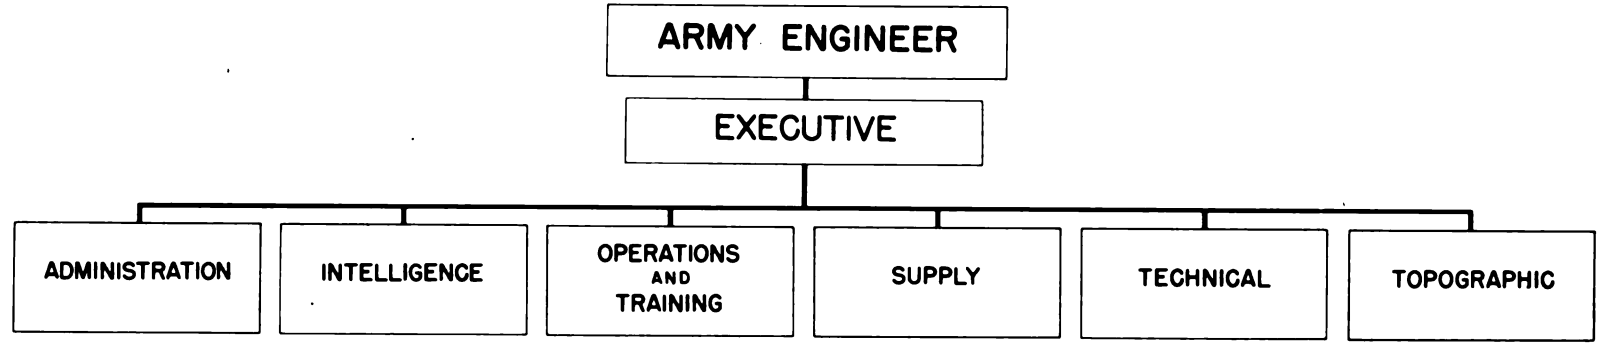
HEADQUARTERS
THIRD UNITED STATES ARMY
Office of the Engineer
APO 403

SUBJECT: Transmittal of After-Action Report of the Engineer Section.

TO : Commanding General, Third U.S. Army, APO 403.

1. Transmitted herewith is the After-Action Report of the Engineer Section, Headquarters Third U.S. Army, beginning with the arrival of the Engineer Section at Camp Peover, Cheshire, England, on 23 March 1944, and continuing through the planning phase, the pre-operational phase on the Continent, and the campaigns of Normandy, Northern France and Germany.

2. The work of the Engineers of Third U.S. Army during these campaigns covered all normal engineering work in support of an Army in combat, including breaching of enemy obstacles; location and removal of mines; assault crossings of rivers; floating and fixed bridging; road maintenance and construction; construction of prisoner of war enclosures; rehabilitation of damaged billets and hospitals; water supply; camouflage; fire fighting; mapping, including reproduction and distribution; furnishing of engineer intelligence data; furnishing of engineer supplies and maintenance of engineer equipment, and many other miscellaneous engineer tasks. Of all the engineer work done, the largest single item was bridging.



JOHN F. CONKLIN,
Brigadier General, U S Army,
Engineer.

ENGINEER SECTION

Organizational and Functional Chart

DECLASSIFIED

ADMINISTRATION

Operates the Section message center.

Maintains the Section correspondence files.

Consolidates the Daily Logs of the several Sub-sections, and incorporates them into the Section Log.

Coordinates thru G-1 all administrative personnel actions affecting engineer troops with the Army, including allotment of school quotas.

Coordinates thru the Headquarters Commandant all details connected with the local defense, movement, office supply and operation of the office establishment of the Engineer Section.

Coordinates thru the Headquarters Commandant all matters of military discipline affecting enlisted personnel of the Engineer Section.

Coordinates thru the Adjutant General the distribution of Engineer Technical publications.

Supervises the use of transportation allotted to the Engineer Section.

Performs, in addition to the above, all functions of an administrative nature necessary to the comfort and orderly conduct of the Section.

INTELLIGENCE

Collects, evaluates and disseminates engineer intelligence pursuant to policies established by the Army Engineer or prescribed by higher authority.

Arranges through G-2 for the collection of engineer intelligence from Army intelligence agencies.

Maintains a reference library of technical, geographical and geological data pertinent to present or prospective operations.

Maintains maps to reflect the current status of the engineer intelligence situation.

Supervises and controls the operations of Engineer Technical Intelligence Teams assigned to Army Headquarters.

Designs, in consultation with other Sub-section Chiefs, engineer intelligence reporting devices and procedures to insure complete coverage, by reconnaissance agencies, of data essential to engineer operations, and initiates their promulgation to units concerned.

OPERATIONS AND TRAINING

Outlines training objectives and prescribes standards of technical proficiency to be attained by all Engineer troop units with the Army.

Prepares plans for the disposition of Army Engineer Troops, coordinating with G-3 as such plans affect tactical displacement, and with G-4 as they affect troop movements.

Prescribes the nature and scope, and supervises the conduct of training undertaken by Army Engineer troop units.

Coordinates through the Administrative Officer the distribution of training publications.

Conducts training inspections and tests of engineer troop units with the Army.

Keeps the Engineer informed of current Engineer troop dispositions by maintaining the Engineer Troop Disposition Map.

Drafts the engineer paragraphs of and the engineer Annexes to Field Orders.

SUPPLY

Computes Class II engineer requirements for the Army.

Assembles, evaluates, and consolidates all engineer supply requirements, initiates their procurement, and follows up to insure their delivery in the desired quantities, at the proper places, on time.

Coordinates through G-4 the preparation of the engineer supply plan and drafts engineer paragraphs and annexes to Administrative Orders.

Takes all necessary action to effectuate the Engineer Supply Plan.

Maintains stock records of engineer items of supply and keeps the Engineer currently informed of the status of engineer supply.

Prepares the Engineer Equipment Maintenance Plan for the Army and coordinates through the Engineer Operations Officer the disposition of Engineer Maintenance Companies with the Army.

TECHNICAL

Prepares estimates of the const. requirements of the Army; translates these estimates into phased bills of materials and labor requirements and transmits them to the Supply Officer and to the Operations Officer, respectively, for procurement.

Draws plans and specifications for specific const. projects as directed by the Army Engr.

Develops plans for the const., repair, maintenance, and operation of utilities necessary to the functioning of the Army.

Prescribes standards of const., maintenance, and operation of communications (except signal) and utilities.

Supervises the execution of const, maintenance, and operational tasks charged to agencies, other than Engineer Troop Units, operating under direct control of the Army Engineer.

Inspects for technical proficiency, the execution of Engineer operational tasks by Engineer Troop Units with the Army.

Collects detailed engineering data and prepares engineering plans pertaining to: Fortifications, minefields and barriers; demolitions; assault of fortified zones; camouflage; floating bridges; water supply.

Reconnoiters the available road net and recommends action necessary to fully exploit its capacity with a minimum of attendant maintenance.

Maintains schedules, progress charts, and operations maps to reflect the current status of all const., maintenance and utility operations under supervision of the Sub-section.

Acts as consulting agency for Army on technical engineering matters.

Discharges all functions pertaining to the acquisition and disposal of Real Estate delegated to the Engineer by higher authority.

TOPOGRAPHIC

Plans and supervises the procurement, production, storage, and distribution of maps, map substitutes, photographs, charts and models for the Army.

Coordinates the survey activities of the Corps Topographic Companies and the Army Topographic Battalion to the end that the survey requirements of the Army as a whole are best satisfied.

Works in close liaison with the Army Artillery Officer in formulating survey plans so that full utilization will be made of the combined survey means available to Army.

Prepares, subject to G-2 approval, the Army Map Plan as an Appendix to Field or Administrative Orders.

Supplies the reproduction needs of Army Headquarters.

Maintains records affecting accuracy of maps and survey control in current use and takes active steps to immediately disseminate corrections to affected unit headquarters.

DECLASSIFIED

CHAPTER 1
PLANNING IN UNITED KINGDOM

On 23 March the Engineer Section moved into the Forward Echelon of Headquarters Third U.S. Army at CAMP PEWSER.

The Section, upon its arrival, consisted of twenty-eight officers, one warrant officer, and forty-three enlisted men, organized under T/O [illegible], dated 17 July 1943. Functional chart of the organization is shown on the preceding page.

Here began a period of intensive planning covering troop phasing requirements, terrain analyses, bridge requirements, river crossing sites, road studies, traffic circulation plans, computation of all engineer supply requirements up to D plus 90, and survey and mapping plans. Strategic terrain analyses were prepared from a study of all available data on the region of Northwest France, north of the LOIRE River and west of the SEINE River, and later extended to cover the area south of the LOIRE. Annex [illegible]. A special study was also made of these same regions as to their suitability for tank warfare. Each of these studies was published by A.C. of S. G-2 in a series of Target Area Analyses.

In computing the bridging requirements for the operations contemplated by Third U.S. Army, an arbitrary roadnet of Class 70 and Class 40 roads was selected, in accordance with the policy established in "OVERLORD" for roads to be provided and maintained within the assault zone. This policy proposed the following as normal road requirements for planning purposes:

(a) One Class 40 road per front line division forward of Corps rear boundary.
(b) One Class 70 road and one Class 40 road per Corps in rear of Corps rear boundary.
(c) Lateral roads at 11 mile interval in rear of Corps rear boundary, alternately Class 70 and Class 40.

After selecting the most suitable roadnet based on the above policy, the bridging requirements were estimated on the assumption that all bridges would be destroyed and would require replacement. Where data on stream widths were not available, the probable bridge requirements were calculated from the size of the drainage areas above the crossing sites. It was estimated that during the period D plus 29 to D plus 90 standard 13½-foot double-double Bailey bridges would be required.

All major rivers were carefully studied to determine the most suitable crossing sites. The widths of the river, depth of water, condition of the riverbed and nature of the banks, as well as the adequacy of the roadnet leading to the crossing site, were taken into consideration.

Road studies comprised such items as road widths, surfacing, sharp curves, and other critical restrictions. From these road studies tentative traffic circulation plans were prepared, with the realization that the final traffic circulation plans must be based on actual ground reconnaissance.

Class II supplies were calculated logistically, based upon the troops to be assigned. Class IV supplies were calculated from intelligence data, map studies, and capabilities of engineer troops to be assigned. Requisitions were sent in to include supplies up to D plus 90. Four light pontoon companies were equipped with Bailey bridges prior to embarkation and all combat battalions were equipped with D-7 tractors in addition to T/E.

In April the 1581st Engineer Survey Liaison Detachment was assigned to Headquarters Third U.S. Army and attached to the Engineer Section. This detachment of five officers and nine enlisted men was incorporated into the Engineer Section and was charged with the planning and supervision of map reproduction, supply and distribution; and surveys.

A plan for the recovery and extension of survey control by combined efforts of Survey Platoons and Field Artillery Observation Battalions during operations was adopted and published as an Operations Memorandum (Annex 2).

Map distribution on the Continent was covered by an Operations Memorandum published 11 June (Annex 3). This memorandum outlined the procedure for distribution of maps in the United Kingdom to troops leaving for the Continent, both build-up or in assault, as well as for distribution on the Continent. This depot closed operations at ALTRINCHAM on 3 July and opened on the Continent in France after the arrival of Headquarters Third U.S. Army.

Several relief models were constructed for study of Western France and certain fortified islands. Third U.S. Army having no model making detachment, the models were constructed by three enlisted men of the Army Topographic Battalion. Photographs were made of these models and halftone reproductions made at a final scale of approximately 1/50,000. These models were used extensively by staff sections for planning and later in operations. They were forwarded to the War Department after operations extended beyond their area of coverage. The halftone "mosaic mosaics" made from the originals were distributed down to and including regiments. They were also later used to supplement and illustrate G-2 Order of Battle reports and the "OVERLORD" War Report.

At about the same time the terrain models were being constructed, considerable interest was demonstrated in third dimensional Vectography and, at the request of the A.C. of S, G-2, an officer from the Topo Subsection was assigned the task of investigating facilities for their production in large quantities. Visits to [illegible] and HIGH WYCOMBE, England, revealed a plant in the process of completion capable of producing 75,000 vectographs per month. These facilities were utilized by the G-2 Section for several orders of considerable size and the results were received with enthusiasm. However, the eventual fast pace of the campaign, coupled with the fact that vectographs could only be supplied from the United Kingdom, made their use impractical.

Prior to leaving the United Kingdom it was realized that there should be a reproduction unit with Army Headquarters to take care of the many small rush jobs required. It was believed that there would be many situations when the Engineer Topographic Battalion, because of its space requirements and relative immobility, would be located at a considerable distance from Army Headquarters. In forming this reproduction detachment, it was decided to take a press trailer with a Harris 40" x 22½" lithographic press, a camera van and a 2½-ton truck, together with the necessary personnel consisting of one officer and nine enlisted men, all from the Army Topographic Battalion. This detachment proved to be of immense value in turning out rush jobs for Army Headquarters and in relieving the Army Topographic Battalion of many small jobs which might have interfered with the larger reproduction work of the battalion.

During this entire planning phase the training of all Third U.S. Army engineer units in the United Kingdom was continuously checked and coordinated. Periodic inspections were made and deficiencies in training corrected as rapidly as possible. Training activities were largely concentrated on Bailey bridging, construction and maintenance of roads, mines and booby traps, including the use of the non-metallic mine detector, and waterproofing of vehicles. Training Memorandum No. 2, issued 17 April (Annex 4), covered the objective and scope of engineer training during this period. The Engineer Battalion of the 2nd French Armored Division was trained in the use of Bailey and U.S. Floating Bridging.

Procurement directives covering the acquisition of real estate, billeting, (Annex 5) and hiring of civilian labor (Annex 6) were drawn up in consultation with Headquarters European Theater of operations memorandum (Annex 7).

On 27 June the 2890th Engineer Technical Intelligence Team, consisting of three officers and six enlisted men, joined the Engineer Section, being attached to the Intelligence Subsection. The mission of this team was to search for and examine captured enemy materiel and to send to higher echelons for further examination and evaluation samples of any new type equipment located. The team was also immediately to disseminate to troops any information of value pertaining to new types of enemy engineer materiel.

After Headquarters Third U.S. Army moved to a concentration area near SOUTHAMPTON, the Engineer Section moved to SOUTHAMPTON on 4 July and embarked for the Continent.

CHAPTER 2
PRE-OPERATIONAL ON CONTINENT

The Engineer Section landed on UTAH Beach in an LST the evening of 6 July, from which beach the Section moved to a bivouac area near NEHOU (T-1998) on 7 July.

The period from date of landing to the start of operations was principally devoted to final stages of planning. Reconnaissance of roads was made in the major portion of the captured region of France to acquire actual data for comparison with the road information used during preliminary planning stage in England. Although it was found that the Germans had not destroyed as many bridges as was contemplated no major changes were made in the estimated bridging requirements.

Bridging and other engineer material requirements were estimated for the period D plus 90 to D plus 120 during this final planning phase.

Shortly after arrival on the Continent, a reconnaissance of bivouac areas was made for the concentration of engineer units. The arrival of the units was coordinated and arrangements were made for guiding them from the beaches to bivouac in the concentration area in the vicinity of BRICQUEBEC (O-1304). During the period from 7 July to 1 August, the following engineer units arrived:

UNITS	ARRIVAL	UNITS	ARRIVAL
1092d Engr Util Det	7 July	993d Engr Trdwy Br Co	22 July
168lst Engr Surv Lm Det	7 July	66th Engr Top Co	22 July
2d Bn Engr C Bn	13 July	2894th Engr TIT	22 July
666th Engr Top Co	14 July	18th Engr Hv Pon Bn	23 July
2896th Engr TIT	14 July	528th Engr L Pon Co	23 July
133d Engr C Bn	14 July	15th Engr C Bn	24 July
652d Engr Top Bn	16 July	168th Engr C Bn	24 July
1117th Engr C Gp	16 July	994th Engr Trdwy Br Co	24 July
1101st Engr C Gp	16 July	88th Engr Hv Pon Bn	25 July
970th Engr Maint Co	17 July	996th Engr Trdwy Br Co	25 July
509th Engr L Pon Co	18 July	1303d Engr GS Regt	25 July
514th Engr L Pon Co	18 July	2877th Engr TIT	26 July
1277th Engr C Bn	18 July	997th Engr Trdwy Br Co	26 July
994th Engr Trdwy Br Co	18 July	87th Engr Hv Pon Bn	27 July
459th Engr Depot Co	18 July	1240th Engr FP Plat	27 July
1107th Engr C Gp	19 July	2890th Engr TIT	27 July
529th Engr L Pon Co	19 July	165th Engr C Bn	28 July
660th Engr L Equip Co	19 July	24th Engr C Bn	28 July
1411th Engr MS Co	19 July	553d Engr Hv Pon Bn	30 July
632d Engr L Equip Co	20 July		

These units concentrated on training in mines and booby traps and performing maintenance of equipment. The Technical Intelligence Teams under Army and corps gave lectures and demonstrations to all engineer units on new enemy mines and antipersonnel devices that were being encountered on the front of the VIII Corps, which corps was in operations at that time under First U.S. Army.

After arriving on the Continent but before becoming operational, the survey elements of the Army and corps were ready for action. But it appeared that the tactical situation would not require engineer participation to augment the observation battalions. However, plans were accomplished to make their services immediately available if and when the occasion arose.

The Army Map Depot opened on the Continent at BRICQUEBEC (O-1304) on 19 July for issuance of operational maps in limited quantities only, in that operational maps were not authorized Army prior to its becoming operational.

On 31 July, Forward "A" Echelon of the Engineer Section moved from the vicinity of NEHOU (T-1998) to an assembly area 12 miles northeast of MONTSURVENT (T-2064) prior to becoming operational on 1 August.

CHAPTER 3
AUGUST OPERATIONS

I - OPERATIONS

When Third U.S. Army became operational, the engineer mission was to support the operation through normal engineer functions. Division, corps and Army engineer troops were to be responsible for all engineer work within their respective areas; with the exception of installation of bulk POL facilities, reconnaissance and reconstruction of rail and port facilities, which were responsibilities of engineer troops of Communications Zone; and the construction of air fields, which was the responsibility of the Air Force.

From the start the operations were characterized by rapid advances and equally rapid changes in attachments of engineer troops to meet the changing situation.

Digitized by Google

Engineer Operational Instruction No. 1, defining areas of responsibility for army engineer troops, was published as of 0200GB August. At this time the disposition of engineer troops was as follows:

VIII Corps

116th Engr C Gp
117th Engr C Gp
4th Engr C Bn
125th Engr C Bn
154th Engr C Bn
196th Engr C Bn
203d Engr C Bn
540th Engr L Pon Co
541st Engr L Pon Co
543rd Engr L Pon Co
622nd Engr L Equip Co
94th Engr Maint Co
994th Engr Trdwy Br Co
997th Engr Trdwy Br Co
66th Engr Top Co
2893d Engr Tech Int Team

XV Corps

111th Engr C Gp
11th Engr C Bn
165th Engr C Bn
1457th Engr C Bn
540th Engr L Pon Co
993rd Engr Maint Co
994th Engr Trdwy Br Co
666th Engr Top Co
646th Engr L Equip Co
2897th Engr Tech Int Team

III Corps

2897th Engr Tech Int Team

XX Corps

664th Engr Top Co
2897th Engr Tech Int Team

Army

111th Engr C Gp
204th Engr C Bn
528th Engr L Pon Co

613th Engr L Equip Co
111th Engr MS Co
139th Engr Fill Det
1st Engr Surv Co Det
1st Engr FF Plat (Atchd XV Sea Supply Co)
2893d Engr Tech Int Team
997th Engr Trdwy Br Co

The 111th Engineer Combat Group was placed in support of the VIII Corps, followed by the 143d Engineer General Service Regiment in the Army area.

On 5 August the four Engineer Heavy Pontoon Battalions under the 111th Engineer Combat Group were detached in order to perform essential hauling of engineer Class IV supplies. The 994th Engineer Dump Truck Company was also detached from the 111th Engineer Combat Group and attached to the 143d Engineer General Service Regiment to lend mobility and hauling facilities to the regiment.

By 7 August the XV Corps had become operational and the XX Corps was concentrating preparatory to becoming operational. Two combat groups, six combat battalions, three light equipment companies, one camouflage company, two dump truck companies, one light pontoon company, and one treadway bridge company were assigned to Third U.S. Army from First U.S. Army. On 7 August Engineer Operational Instruction No. 2 was issued with the 111th Engineer Combat Group being attached to XX Corps and the 1109th Engineer Combat Group concentrating under Army. The 1117th Engineer Combat Group was placed in support of XV Corps and the 143d Engineer General Service Regiment in support of VIII Corps, both operating in the Army area.

On 9 August Engineer Operational Instruction No. 3 was published. At this time the 151st Engineer General Service Regiment had concentrated on the Continent and was available for operations and was placed behind the 1117th Engineer Combat Group supporting XV Corps. The 143d Engineer General Service Regiment remained in support of VIII Corps and the 1st Engineer General Service Regiment was concentrating to support operations. The 111th Engineer Combat Group was attached to XV Corps and the 113th Engineer Combat Group was attached to XX Corps.

On 11 August Engineer Operational Instruction No. 4 was published, placing the 1340th Engineer General Service Regiment on the south flank and assigning the 111th Engineer Combat Group, with four heavy pontoon battalions, the mission of coordinating and effecting the movement of engineer Class IV supplies.

On 13 August Engineer Operational Instruction No. 5 was published, at which time the 111th Engineer Combat Group was attached to XII Corps. The 151st Engineer General Service Regiment was assigned the mission of supporting the XV Corps, the 1st Engineer General Service Regiment the XX Corps, and the 143d Engineer General Service Regiment remained in support of VIII Corps.

On 15 August Engineer Operational Instruction No. 6 was published. At this time the VIII, XV, XX, and XII Corps were all in operation, and the bulk of engineer troops assigned Third U.S. Army had arrived on the Continent.

The 130lst, 1303d, and 1306th Engineer General Service Regiment were placed in support of the XII, XV and XX Corps, respectively, and the 111th Engineer Combat Group was actively engaged in moving forward engineer Class IV supplies.

On 19 August Engineer Operational Instruction No. 7 was published, effecting the detachment of one combat battalion from VIII Corps and two combat battalions, one treadway bridge company and one light equipment company from the XV Corps and their attachment to XII Corps. 111th Engineer Combat Group and the 1306th Engineer General Service Regiment. Missions remained unchanged.

On 21 August Engineer Operational Instruction No. 8 was published, effecting the attachment of Hq & Hq Co, 1135th Engineer Combat Group to XII Corps, one treadway bridge company to XV Corps and Hq & Hq Co, 1107th Engineer Combat Group to Army. The 1135th Engineer Combat Group was given the mission of concentrating prepared to support either XII or XX Corps. The mission of the 111th Engineer Combat Group, 1st, 1303d, and 1306th Engineer General Service Regiments remained unchanged.

On 24 August Engineer Operational Instruction No. 9 was published. At this time XV Corps reverted to First U.S. Army, together with all corps engineer troops. The 1107th Engineer Combat Group was assigned the mission of performing all engineer work in the zone of the Army supporting the 1306th Engineer General Service Regiment and the 1137th Engineer Combat Group, respectively.

II - CONSTRUCTION

Roads and Bridges.

One of the most critical problems confronting the Engineer, Third U.S. Army, at the start of operations on 1 August was the selection and maintenance of an adequate network of north-south roads through a very narrow zone over which the entire Third U.S. Army and supporting supplies must pass. The zone of action established for this Army consisted of a narrow strip along the western coast of the CONTENTIN Peninsula, varying in width from ten to twenty miles. This zone was cut deeply on the west by three tidal estuaries, one at the south of the DIGUE River near ST. JAMES (T-4457), and the other two at the mouths of the SEE and SELUNE rivers near AVRANCHES (T-2417). Only two principal north-south highways extend through this area and these converge in and follow the same route through COUTANCES (T-2457) and AVRANCHES (T-2817).

At ST. JAMES (T-2447) it was found possible, by extensive bridging operations and continuous maintenance of a secondary road on the west of ST. JAMES (T-4457), to separate these two routes and eliminate this first potential bottleneck.

In the town of GRANVILLE (T-1134), the existing highway followed narrow winding streets which were definitely unsuitable for military traffic. This condition was corrected by selection and repair of the two one-way by-pass routes immediately to the east of GRANVILLE (T-1134).

The greatest restriction through which this Army was forced to move all troops and supplies was at AVRANCHES (T-2817), where the zone narrowed to ten miles or less. All axial highways within this zone converged on AVRANCHES (T-2817) and then followed only one principal route south for five miles to PONTAUBAULT (T-3010). The town of AVRANCHES (T-2717) itself was badly demolished from bombing and the streets were full of debris, which engineer troops expeditiously cleared from the principal streets. The bridge over the SEE River at AVRANCHES (T-2817) was captured intact; however, the bridge at PONTS (T-2718) was demolished. This latter bridge was rapidly repaired to accommodate two-way Class 40 traffic by using a Bailey bridge on one-half of the roadway and sections of treads from a treadway bridge company on the other half of the partially demolished structure. These treads were removed as soon as possible by constructing a Class 70 fixed timber trestle bridge alongside the partially demolished structure. While this timber bridge was under construction by the 1303d Engineer General Service Regiment, one soldier was killed and five injured as a result of enemy bombing.

The enemy attempted nightly to bomb these critical bridges, including the bridge over the SELUNE River near PONTAUBAULT (T-3010), as a countermeasure to the possibility that one of these three vital structures might suffer a direct bomb hit, every possible crossing within the narrow zone of the Army was reconnoitered. The results revealed four north-south local gravel roads to the east of AVRANCHES (T-2817) on which the bridges were found intact. These alternate routes were very narrow, winding and rough; but were considered usable in an emergency.

It was found impracticable to attempt to bridge these estuaries at any point west of AVRANCHES (T-2817) and west of Highway N 176 at PONTAUBAULT (T-3010), due to the extreme width and the large tidal fluctuations.

Realizing that the success of accomplishing the mission of Third U.S. Army depended upon the continued flow of troops and supplies through this narrow funnel, an existing railroad bridge over the SEE River at AVRANCHES (T-2817) was prepared to accommodate highway traffic. A treadway bridge was placed across the SELUNE River about 300 yards upstream from the existing masonry arch bridge near PONTAUBAULT (T-3010).

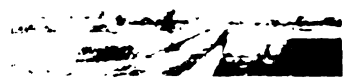
As soon as this defile was passed, the road net available to the Army extended to the west, south and east, providing excellent routes of advance in those directions.

Once the breakthrough was accomplished, the combat troops moved so rapidly that enemy destruction of bridges was only a small percentage of that contemplated in the planning stage. The town of FOUGERES (T-3879) has been badly damaged by bombing and artillery fire, but the debris was rapidly removed from the more important thoroughfares, bomb craters filled and military traffic was kept rolling with a minimum of delay. FOUGERES (T-3879), having eight principal highways radiating from the city similar to the spokes in a wheel and without suitable by-pass routes, was immediately recognized as a major traffic problem. A study was made of this city and a traffic circulation plan devised and submitted for approval. This plan was immediately adopted and its execution materially improved the flow of traffic through this city.

The BRITTANY Peninsula and the area south to the LOIRE River was exploited so rapidly that the majority of the bridges were captured intact and the roads were found in very good condition. Engineer road and bridge work in this area consisted principally of patrolling the roads with maintenance crews to check the condition of the roads and to make immediate repairs to critical spots, such as shell craters or bombed bridges. Very little enemy action of this nature occurred other than in the restricted area around AVRANCHES (T-2817).

In executing the movement to the east and southeast, it was found that the enemy had destroyed all the bridges across the MAYENNE River with the exception of two bridges south of LAVAL (T-6846), one at MA SSAY (T-7027), and the other at CHATEAU GONTIER (U-7219). Five Class 40 Bailey bridges were immediately placed across the river, two of which were in LAVAL (T-6846), one at the crossing of GC 3 near ENTRAMMES (T-7698), one at CHANGELLAY (U-7405), and one at LE LION (U-7147). With the mass of supplies flowing through LAVAL (T-6846), it was decided to construct an additional Bailey bridge at LAVAL (T-6846) of Class 70 to accommodate the Class 70 vehicles which were used to transport ammunition from one Army dump to another. A Class 24 one-way trestle bridge was also constructed in LAVAL (T-6846) to accommodate the civilian traffic, thus permitting the Bailey bridges to be used to the maximum extent by military vehicles only. Many of the bridges over the SARTHE River were also destroyed or partially destroyed by the enemy. At LE MANS (V-4062) all bridges, except one two-way stone arch bridge, was destroyed. One Class 40 Bailey bridge was constructed in LE MANS (V-4062) to provide for a more complete utilization of the highway net leading through LE MANS (V-4062). By-pass routes to the north and south of LE MANS (V-4062) were also found and used on which existing bridges had not been destroyed.

In the drive to the SEINE River many of the major bridges were found demolished, but were rapidly replaced by first constructing Bailey bridges.



Because of the extended supply routes, every effort possible was made to replace the Bailey bridges with fixed timber bridges or steel I-beam bridges of local materials in order to keep pushing the Bailey bridges forward for re-use by the Corps and Division Engineers.

The reconnaissance information was consolidated and traffic circulation diagrams prepared and submitted for approval and execution. Throughout the rapid advance of this Army it has been impracticable to obtain current road and bridge information through normal intelligence channels. To offset this handicap, each engineer combat group and general service regiment under Army control, but in support of corps, were instructed to push their reconnaissance agencies forward through the zone of corps responsibility and report their reconnaissance data direct to the Army. In addition to these sources of information, three officers from Army engineer units were given the special mission of projecting road and bridge reconnaissance as far forward as enemy action would permit.

The normal bridging requirements were about two sixty-foot bridges

DECLASSIFIED

Class 40 Double-Single Bailey bridge across the ARNO River at EMPOLI. Length 260 Ft. Built by the 1302nd Engineer General Service Regiment 30 August 1944.

Since the 5th Division planned to cross the TIBER river south of MONTERIANO (R-4667), it was necessary to have a suitable crossing over this stream, so a railroad bridge just south of MONTERIANO (R-4667) was planked and was used by the infantry and lighter vehicles and an old civilian pile bridge at MILE 268 RIBBI (T-5068) was strengthened to carry heavier loads. This bridge was too weak for tank loads, and XX Corps ordered the 88th Engineers to construct another heavy pontoon bridge near this site.

Digitized by Google

in the vicinity of COURTALAIN (W-0464), approximately one mile north of the town. Reconnaissance was made on 17 August. The site was located on a stream in a large pasture. It was rectangular in shape and was approximately 750,000 square feet in size.

On 22 August the necessity for a new prisoner of war enclosure was indicated in the vicinity of NEMOURS (A-1070). Work was started on 24 August and completed on 28 August. Because of a lack of concertina wire, the 1341st Engineer General Service Regiment was given the task of dismantling and returning to the depot all wire contained in the BRUYAS (2-2833) site.

III - SUPPLY

Class II and IV engineer supplies, for which pre-scheduled requisition had been submitted, were arriving on the beaches by 1 August and were being stockpiled by Advance Section Communications Zone. Requisitions for Class II and IV supplies for depot stocks were submitted to Advance Section and a representative of the Supply Subsection of that headquarters assisted in securing release of all available supplies. The most serious problem which presented itself was the question of transporting these supplies from beach dumps to the Army depot, which was to be located in the vicinity of LE MANS (T-2066). The railroads as yet were not in operation. To overcome this situation, four Army heavy ponton battalions were organized under an engineer combat group into a Provisional Transportation Group, and by this means supplies were picked up at beach dumps and transported to the Army depot. By the afternoon of 1 August approximately 3,000 tons of engineer supplies were stocked at the depot in LE MANS (T-2066). Two corps dumps were established primarily for storing Class IV supplies and a small amount of other Class IV supplies. Heavy ponton transportation was used for hauling these supplies. No. 1 corps dump was located at ST. AUBIN DE TERREGATTE (T-3102) and No. 2 in the BRITTANY Peninsula in the vicinity of ST. MALO (G-4614).

The next movement of the Army depot was from LE MANS (T-2066) to LE MANS (T-4062). This movement was accomplished by heavy pontion battalions, which were at the same time continuing to pick up supplies at the beach dumps.

On 25 August the Army depot was advanced to PUISEAUX (A-1070). At this time Advance Section Communications Zone had been able to secure the assignment of sufficient trucks and rail facilities to transport supplies into CHARTRES (A-4062), and in some cases even up to the Army depot.

The average daily tonnage which was hauled by the four heavy pontion battalions was approximately 1,500 per day from 1 August to 25 August. One of the most serious problems encountered was securing replacements of treadway bridging. About 24 August Communications Zone established Army area trucking trucks loaded with M-4 and M-2 treadway bridging. This bridging was short certain essential parts, and it was necessary to dispatch trucks to beach dumps to secure these parts. Another serious shortage of material was in water purification equipment. The front line combat battalions were losing equipment due to enemy action and replacements were very difficult to secure. By the end of August this situation had been relieved slightly. Electric lighting equipment was also short in the early stages. However, several German installations were found to be stocked with electric equipment and were taken over by the Supply Section, electric equipment being issued as required. Several large stock piles of timber were also captured, which eliminated the necessity of transporting large quantities of timber. In most cases, this captured timber was in short lengths, and it was still necessary to bring in a certain amount required for bridging in the Army area.

IV - MAPS

From 6 July to 1 August, when Third U.S. Army was non-operational, the maps covering France were all controlled by First U.S. Army. Communications Zone had two advance depots at "UTAH" and "OMAHA" beaches, but these were also under First U.S. Army control.

The lack of access to these stocks by Third U.S. Army became at once a serious handrance. Staff planning requirements could only be met by going to First U.S. Army, securing a release, then going to both of the depots for a pickup.

During this time every effort was made through Third U.S. Army G-2 and through Engineer and Signal channels of Twelfth U.S. Army Group to secure the release of these maps in operational quantities. However, no maps were released in operational quantities until Third U.S. Army became operational. Map distribution on an operational basis started at 1100A, 1 August, in the middle of a field located two miles northeast of MONTSURVENT (T-2064).

To expedite emergency mapping on the movement south in the event that Army became operational arrangements had been made for divisional breakdown of maps separately carried on trucks as follows:

1 Armored Division) Covering Brittany Peninsula to its
1 Infantry Division) western edge (VIII Corps area).

1 Armored Division) Covering area south from COUTANCES (T-2457)
1 Infantry Division) to the general line of LAVENT (G-7231,-
BANTIES (G-0554), (XV Corps area).

In addition to receiving the above maps, as planned, there arrived from Communications Zone in the field referred to above eight truck loads of maps, scale 1/50,000 and 1/25,000, covering the BRITTANY Peninsula from ST. MALO (G-8614), west. With these maps on hand, the First Tank Destroyer Brigade was supplied in operational quantities for its initial mission. Approximately sixty per cent of these maps were delivered to the unit's tivouac area at 0900, 2 August, and the remainder at 1500 of the same day. Because of a change of mission, these maps were returned the following day. It later developed that this was but one of the many instances in which it became necessary, because of a change in the tactical situation, to remap the same unit.

During the time that the above was accomplished, the first Third U.S. Army Map Depot was set up in a residence located at MONTSURVENT (T-2064), under operational conditions.

During the month of August the following personnel were used to augment the regular Third U.S. Army Map Depot personnel:

Four officers and two enlisted men from the 1668st Engineer Survey Liaison Detachment
One platoon from the 293rd Engineer Combat Battalion from 1 to 8 August
Survey Platoon of the 65.nd Engineer Topographic Battalion from 7 August to September

The following movements were made by Third U.S. Army Map Depot:

From BRICQUEBEC (G-1364) to MONTSURVENT (T-2064) - 2 to 4 August
From MONTSURVENT (T-2064) to PUISEAUX (T-3879) - 7 to 8 August
From PUISEAUX (T-3879) to LE MANS (T-4062) - 16 to 17 August
From LE MANS (T-4062) to PUISEAUX (A-1070) - 23 to 24 August

A reproduction project consisting of twenty-six sheets, 1/25,000 topographic maps in the vicinity of COUTANCES (T-2457)-AVRANCHES (T-4851), commenced on 28 July, was completed and delivered to the Army Map Depot on 3 August in quantities ranging from 1,000 to 5,000 copies of each sheet.

On 6 August a reproduction project consisting of fifteen sheets, 1/25,000 topographic maps in the vicinity of BAIN DE BRETAGNE (A-9924), commenced on 31 July and completed and delivered to the Army Map Depot in quantities of 1,200 copies of each sheet.

CHAPTER 4
SEPTEMBER OPERATIONS

I - OPERATIONS

On 1 September the disposition of engineer troops was as listed below, having been changed by engineer operational instruction No. 10, published at 2XXXA0 August, and the assignment of two treadway bridge companies to First U.S. Army:

VIII Corps	XV Corps (cont'd)
11st Engr C Gp	509th Engr L Pon Co
113th Engr C Gp	537th Engr L Pon Co
15th Engr C Bn	94th Engr Trdwy Br Co
44th Engr C Bn	99ist Engr Trdwy Br Co
153th Engr C Bn	66th Engr Tow Co
204th Engr C Bn	28th Engr TIT (2)
540th Engr L Equip Co	1st Plat, Co A, 602d Engr Cam Bn
969th Engr Maint Co	

XV Corps	Army
511th Engr C Pon Co	113th Engr C Gp
99th Engr Trdwy Br Co	1137th Engr C Gp
665th Engr Top Co	133rd Engr GS Regt
28ist Engr TIT (2)	1303d Engr GS Regt
2d Plat, Co A, 602d Engr Cam Bn	1306th Engr GS Regt
	61st Engr C Bn
XII Corps	145th Engr C Bn
111th Engr C Gp	148th Engr C Bn
113th Engr C Gp	249th Engr C Bn
133d Engr C Bn	293d Engr C Bn
166th Engr C Bn	609th Engr L Equip Co
167th Engr C Bn	632d Engr L Equip Co
248th Engr C Bn	5208th Engr L Pon Co
613th Engr L Equip Co	976th Engr Maint Co
72d Engr L Pon Co	948th Engr Trdwy Br Co
511th Engr L Pon Co	572d Engr Gp Trk Co
99ist Engr Trdwy Br Co	76ath Engr Gp Trk Co
999th Engr Trdwy Br Co	77ath Engr Gp Trk Co
67ad Engr Tow Co	87th Engr Hv Pon Bn
28ist Engr TIT (2)	84th Engr Hv Pon Bn
4th Plat, Co A, 602d Engr Cam Bn	160th Engr Hv Pon Bn
	551st Engr Hv Pon Bn
XI Corps	553d Engr Hv Pon Bn
11.3d Engr C Gp	652d Engr Tow Bn
143rd Engr C Gp	43.st Engr Depot Co
135th Engr C Bn	294th Engr TIT (2)
15.th Engr C Bn	1611th Engr MS Co
156th Engr C Bn	1612th Engr MS Co
179th Engr C Bn	12.4th Engr FP Plat
204th Engr C Bn	1644th Engr FP Plat
4.0th Engr C Bn	168ist Engr Surv Un Det
6.3d Engr L Equip Co	1692d Engr Util Det
96ist Engr Maint Co	Co A, 602d Engr Cam Bn (a)

XII and XIII Corps, which were abreast facing northeast, were being supported by the 113th Engineer General Service Regiment and the 1137th Engineer Combat Group, respectively. These two units were, in turn, supported by the 133d Engineer General Service Regiment and the 1306th Engineer General Service Regiment. The VIII Corps, which was cleaning up the BRITTANY Peninsula, did not require the support of army engineer troops.

At 1800GOB September, Engineer Operational Instruction No. 11 was published, effecting the transfer of one combat battalion from XX Corps to XII Corps, one treadway bridge company and one heavy pontion battalion from Army to XII Corps and two heavy pontion battalions from Army to XX Corps. XV Corps, with supporting corps engineer troops, had reverted back to Third U.S. Army, and the 133rd Engineer General Service Regiment was placed in support thereof. The VIII Corps, with all supporting corps engineer troops, was transferred to Ninth U.S. Army. The mission of the 1137th Engineer Combat Group, 1137th Engineer Combat Group, 1306th Engineer General Service Regiment, and 1306th Engineer General Service Regiment remained unchanged.

At 212000A September, Engineer Operational Instruction No. 12 was published, effecting the transfer of one treadway bridge company from XII Corps to XV Corps, the attachment of one treadway bridge company to XII Corps, and the transfer of one light pontion company and one heavy pontion battalion from Army to XV Corps. Missions of Army troops remained unchanged.

At 300BUG September, Engineer Operational Instruction No. 13 was published. At this time the XV Corps, with all supporting corps engineer troops, had been transferred to Sixth Army Group, effective 242400A, and the 133d Engineer General Service Regiment, previously in support of XV Corps, was placed in support of the 1306th Engineer General Service Regiment. The missions of the remainder of the Army Engineer troops remained unchanged.

II - CONSTRUCTION

Roads and Bridges

The terrain over which engineer units of Third U.S. Army were responsible for road and bridge work during the month of September was dissected by such major rivers as the MARNE, the MEUSE, and the MOSELLE, together with numerous smaller streams and canals. During this period of operations enemy bridge demolitions continued to improve both in quality and in the number of bridges destroyed. This was particularly true after Third U.S. Army operations, because of critical shortages of gasoline, were materially slowed down, allowing the enemy more time to prepare and execute bridge demolitions. As a result, practically every bridge over rivers, streams and canals were destroyed that would present an obstacle to our further advance. The

DECLASSIFIED

Digitized by Google

every bridge over the main streams in the area was demolished, and though the streams were generally at a low level during this period, it was necessary to maintain the main highway bridges on the Traffic Circuit intact, since bottlenecks created at by-passes at these points were undesirable for the movements taking place because enemy air activity was always a threat. The start of the rainy season further kept the traffic busy on the roads.

The state of the AB Arms area was not so disruptive as that existing in the south, since, with the exception of bridges at [illegible], and minor crossings over the AISHB, which could be forded, the principal bridges as far east as YB1484 (L-2965) had been overcome and repaired intact. This was particularly fortunate along the coast (Highway YA8435 [illegible] road), since this highway was to be the main army maintenance supply route to Aba and the Hall Arms as well.

The Sittang River crossing at the point where north to south met the east to west, encountered and, as before, all the bridges had been destroyed except, unfortunately, the main highway bridge through Pegu [illegible]. The crossing was expedited by the construction of treadway bridges [illegible] and a ferry. However, once this river had been crossed, the nature of the [illegible] country afforded further advantages.

The [illegible] was very thoroughly [illegible] with [illegible] and [illegible] by the many valleys traversed by [illegible] for the [illegible] to [illegible] a flood season.

[illegible] of [illegible] passed of [illegible] [illegible] [illegible] [illegible]

[illegible] [illegible] [illegible] [

DECLASSIFIED

necessary to leave in all the bridges, since even a short interruption to communications might have been critical at this time.

South and west of NANCY (U-8611), the XII Corps objective, each of the many areas of the MOSELLE presented an individual crossing problem and the initial crossings had to be made by the Infantry in assault boats or by wading. The advances were made under direct artillery and small arms fire and as an indication of the intensity of the fighting, about seventy assault boats were damaged or lost in this area alone.

In the northern section of the corps area, a crossing was attempted near PONT-A-MOUSSON (U-7725), but it was unsuccessful. Subsequently, a successful crossing was made at DIEULOUARD (U-7828), where the MOSELLE flows through a long, wide flat valley, commanded on all sides by high hills. Successful Infantry crossings were made here and the crossing was exploited by putting in several floating bridges. After the bridges were pushed over, the task of defending the bridges was thrust upon the small Infantry force, the heavy pontoon battalion, and some combat engineers. In this manner the bridgehead was held for several days until NANCY (U-8611) was finally captured and Infantry and Armored columns came in and cleared the area.

In NANCY (U-8611), destruction of bridges was complete. Not a single route over the canal and MEURTHE River was left intact, and in all eleven bridges had to be constructed to provide adequate traffic circulation through the town.

Following the fall of NANCY (U-8611), the project of putting in a bridge at PONT-A-MOUSSON (U-7735) was again started, since it was planned to make this a main axial highway and possibly the Army main supply route. However, the east bank was still held by the enemy and one of the officers surveying the crossing was killed by a sniper. The area was finally cleared and an 800-foot bridge was erected at the town using existing piers. The bridge consisted of two Bailey bridges joined by a long stretch of I-beam bridging. An additional obstacle to the building was the fact that the vicinity of the bridge was heavily mined, and it was necessary to clear the area before work could begin. The project was completed in sixty hours of continuous work by the 249th Engineers, and as can be seen in the photographs, it was a major accomplishment.

800 ft Bailey and Steel I-Beam Bridge Constructed By 249th Engineer Combat Battalion at PONT-A-MOUSSON (U-7735) Across the MOSELLE River

Once the MOSELLE had been crossed in force, bridges again came into the picture east of the river, but no major obstacles blocked the way.

XV Corps entered the operational stage back with Third U.S. Army on 5 September, and had the MARNE, MEUSE and MOSELLE River to cross. The principal crossings were made at CHAUMONT (X-3977), NEUFCHATEAU (Z-4979) and CHAMES (U-4976), respectively.

VIII Corps operations under Third U.S. Army on the BREST Peninsula were completed on 5 September, when this corps was transferred to Ninth U.S. Army. No major bridging operations were reported during this period, since the principal task was the siege of BREST (V-9599) and other cities in the BREST Peninsula.

Other Construction.

As during the month of August, the only other construction of any importance during September was prisoner of war enclosures.

On 1 September work was started by the 1303d Engineer General Service Regiment on a prisoner of war enclosure at EPINAL (T-9829). At this site the standard prisoner of war enclosure, 750 feet square, was constructed. This standard was developed after experimentation as to size and arrangement of interior pens and was approved by the Provost Marshal Section.

Because of the shortage of barbed wire, all salvagable wire was picked up and delivered to Engineer Dump No. 6 at CHALONS (T-5465).

On 6 September the 1303d Engineer General Service Regiment was given a work order to construct a standard prisoner of war enclosure in the vicinity of FREMEN (U-4657). Reconnaissance was made on 9 September, construction started the following day, and work was completed 11 September.

Because of the approach of inclement weather and the availability of quarters, the next prisoner of war enclosure was located in the French artillery barracks in TOUL (U-6410). Buildings were encircled with wire of the triple concertina, with some exceptions, where four-strand wire was constructed. Box-type latrines were constructed over holes twenty-four inches in diameter by twelve feet deep. Two water tank platforms and four guard towers were constructed. This work was performed by the 1303d Engineer General Service Regiment. The work order was issued on 18 September, reconnaissance was made on 19 September, and work completed on 21 September.

III - SUPPLY

As of 1 September two Army Engineer supply installations were being operated by the 459th Engineer Depot Company and two Quartermaster Service Companies. These were Engineer Depot No. 5, located in the vicinity of JUSSEAUX (X-1070), stocked with Engineer Class II, IV and V supplies and spare parts; and Advance Engineer Supply Point No. 6, supporting XII, XX and XV Corps, located in the vicinity of CHALONS (T-5445), and stocked with Class IV Engineer supplies, consisting mainly of Bailey bridging. Class II and Class IV Engineer supplies, with the exception of Bailey bridging, were transported to Army Engineer depots by Advance Section Communications Zone and Army transportation. Bailey bridging was being brought into Army depots by Communications Zone truck transportation.

On 7 September a new supply procedure was instituted by Communications Zone whereby supplies furnished each service of the Army were based on a daily tonnage allocation. The Engineers were allocated forty-three long tons daily for all classes of supplies. Daily requisitions representing this tonnage were submitted to A.C. of S., G-4, Army, for forwarded them to the 24th Regulating Station. From there they were routed to the G-4 Section, Advance Section Communications Zone. Such items as were available in Advance Section Communications Zone Engineer depots were filled and the remaining items extracted to Communications Zone. Supplies were forwarded to Army trainheads and railheads by Communications Zone transportation. Items on the daily requisition which were filled by Advance Section Communications Zone were forwarded to Army Engineer depots by Advance Section Communications Zone transportation, augmented, when necessary, by Army transportation.

Daily tonnage allocation to the Engineers was increased to seventy-three tons on 12 September, since it was found that forty-three tons were not sufficient to supply Third U.S. Army units with Engineer supplies. A special allocation of 3,554 long tons for Bailey bridging was obtained from Communications Zone. This bridging was moved to the Army area by special bridge trains dispatched directly from the NORMANDY Base Section.

Third U.S. Army Engineer Depot No. 7 was established for all classes of Engineer supplies in the vicinity of FREMEN (U-4657) on 8 September. Since this depot was located well forward in the Army area, it was designed to service both corps and Army troops.

Engineer Depot No. 7 at FREMEN (U-4657)

All inter-depot movements of Engineer supplies continued to be performed by the 119th Engineer Combat Group and attached units. Because of the rapid movement of the Army, this work required the constant use of approximately 170 2½-ton trucks. At all times priority was given to the movement of bridges. At no time was there a shortage of bridging available to the corps.

In the area occupied by the Army during this period, considerable quantities of captured Engineer materials were encountered. A system was established whereby all captured supplies would be used to the maximum extent. Units reporting captured supplies immediately placed guards and reported the location to the Army Engineer. In order to relieve corps of most of this work, teams made up from the 273d Engineer Combat Battalion were assigned to each corps for the purpose of making complete inventories and maintaining guards. Materials were issued to all troops on the approval of corps or Army Engineer. One officer and two enlisted men from Advance Section Communications Zone were attached to the Engineer Supply Section for the purpose of coordinating the transfer of captured Engineer materiel from Army to Advance Section Communications Zone, which also assisted in guarding captured dumps in the Army area. Captured Engineer supplies, particularly lumber, electrical supplies, and explosives were found to be extremely useful during this period of operations.

First rail shipments of Engineer supplies directly to the Army area were received at VERDUN (U-2965) railhead on 19 September.

Army Engineer Depot No. 8 was opened at TOUL (U-6410) on 26 September. Inside storage was available for Class IV supplies. Prior to this time no inside storage had been used. Railway facilities were also available which enabled rail shipments to be received direct from Communications Zone and Advance Section Communications Zone.

In general, quantities of Engineer supplies received from Communications Zone and Advance Section Communications Zone were adequate to supply the Army. Principal shortages consisted of topographic supplies, paint, spare parts, and bridge flooring. By the end of September there was a decided shortage of bridge lumber because of the fact that most captured lumber dumps had been exhausted. Efforts were started to take advantage of local saw mills for the production of bridge materials.

A shortage of second and third echelon spare parts prevailed throughout the first two weeks in September. However, by 20 September second and third echelon coverage on approximately twenty types of Engineer equipment had been obtained. All spare parts were transported by Army transportation from Advance Section Communications Zone Spare Parts Depot at PARIS (R-0544). Because of the comparatively small demand for spare parts during the rapid advance of the Army, the shortage of spare parts was not a major problem.

Battle Losses of equipment were confined primarily to river crossing equipment, such as Brockway bridge trucks, assault boats, treadway bridging and pontoon bridging. This equipment was replaced from Army and Communications Zone depot stocks.

Digitized by Google

over the period 1 September to 30 September, inclusive, 6AF long tons of Class II, IV and V items, 4 long tons of Class IV, and twenty-two long tons of Class V engineer supplies were received into Army depots from Communications Zone and Advance Section Communications Zone.

During the month of September, the average stock on hand in all Army supply installations by classes and by days of supplies was as follows:

Type of Supplies	Tonnage on Hand	Days of Supply
Class II	[illegible]	2
Class IV	[illegible]	39
Class V	341	3

IV - MAPS

A reproduction program was in progress during all the month of September. First priority work was the [illegible] Project [illegible], covering the [illegible] in front of Third U.S. Army. The facilities of the 41st Engineer Topographic Battalion, 40th Engineer Topographic Company and the 23rd Engineer Topographic Company were used. The program consisted of the [illegible] of 1,000,000 copies each. In addition, [illegible] were printed in sixty-four [illegible] each. With the movement of the Army into Germany it was necessary to [illegible] maps from the area covered by the [illegible] to meet the situation of the Army. This consisted of fifty-seven [illegible] of 1,000 copies each. During this period the situation developed that large scale maps were needed in the [illegible] area. A [illegible] and a [illegible] project was started. These consisted of thirty-nine quadrangles of 8,000 copies each.

In addition to the reproduction work of the Army units, reproduction of [illegible] maps was carried on in PARIS (S-5446), with facilities [illegible] by the 653rd Engineer, Third U.S. Army, and supervised by an officer from this section. This was necessary because Third U.S. Army [illegible] area of which no coverage of the scale was available. It was felt that precautions had to be taken immediately to alleviate this [illegible]. Several days after this project was started, and covering the period I area began to arrive through normal channels and the PARIS (S-5446) plant was closed.

A planimetric map from air photos was made by the 653rd Engineer Topographic Battalion, as a test, in seventy-two hours.

A photomosaic project of nineteen sheets covering the area around [illegible] was [illegible] and completed during the month. Reproduction of these sheets amounted to 8,000 copies each.

A chart was requested by the Army Commander covering the area east of [illegible]. Work was undertaken by the 41st Engineer Topographic Battalion and the chart delivered in eight days.

To assist the Artillery, a project consisting of six 1/100,000 quadrangles was [illegible] trig data. The plotting, checking were done [illegible] Army area production, consisting of 1,000 prints, was done by the Communications Zone plant in PARIS (S-5446).

A system for transposing German trig data to existing theater grid was established by Third U.S. Army in conjunction with Twelfth U.S. Army Group. Work on a graphic solution covering this transformation was carried on.

Several captured map and supply installations were visited during the month. Eight captive truck loads of paper and topographic supplies were sent to the engineer depot.

Conferences were held in PARIS (S-5446), REIMS (T-3080), Twelfth U.S. Army Group and at this Headquarters on map supply and distribution. As a result of these contacts, map supply for Third U.S. Army for the entire month was complete and complete. Maps were being received through normal channels by the end of the month.

Contacts were made with divisions. At the 5th Infantry Division, when the Commanding General desired 1/50,000 maps in an emergency, these were [illegible] Twelfth U.S. Army Group and reproduced by the 653rd Engineer Topographic Battalion.

A letter was sent out cautioning various groups against the use of captured maps, calling their attention to the differences in grids and the possible complications which might arise from their use.

V - INTELLIGENCE

With the military situation moving rapidly, efforts were concentrated upon securing all available information of our interested area deep in our front in Eastern France and Southwestern Germany. The information in which we were mainly concerned was as follows:

a. Topography and roads.
This was to include all terrain analyses indicating areas and roads which favored cross country movement of tracked vehicles and those areas which did not.

b. Rivers.
This was to include width of rivers, velocity, type of river bed, condition of banks, and those areas which were favorable for assault crossings, and those which were not. The rivers of main interest were the MOSELLE, the MEURTHE, the SAAR, and the RHINE.

c. Bridges.
This was to include the location, type, length, width and strength of each bridge, with water gap and existing road net.

All such information available was obtained, appraised, compiled and disseminated to all Third U.S. Army Engineer units. The source of such information was two-fold. Higher headquarters and our own resources, which included the Photo Center, Third U.S. Army, and the 28[illegible]th Engineer Technical Intelligence Team.

The following intelligence data were distributed to various units within this Army:

a. Topography and roads.
There were fifteen terrain studies of various areas, including I.S.T.U. reports and Terrain area maps, issued.

b. Rivers.
There were eleven different studies and reports issued.

c. Bridges.
There were three different bridge reports issued. With reference to bridge reports, it is to be noted that many of the river reports also contained reports on bridges. Bridge studies based on recent photography were issued on the SAAR and RHINE river bridges.

The 28[illegible]th Engineer Technical Intelligence Team prepared a mine chart, [illegible] the various types of German teller mines with the new non-removable igniter. Since this was based on the actual finding and examination of the igniter, a wide distribution throughout the Army was made. The unit was occupied also with the examination of enemy mines at [illegible] (T-5446), [illegible] (U-4464), and [illegible] (U-4670). Items of exceptional interest which were examined were the German seven-inch rifle grenade and the German "J" Heavy Pontoon bridge.

VI - WATER SUPPLY

Nineteen Army water points and three water distribution points for Army troops were opened during the month of September.

Operation of eleven Army water points and one water distribution point, four of which had been opened in August, was assumed by the [illegible]th Engineer Water Supply Battalion of Advance Section Communications Zone. Operation of an Army water supply mobile unit in the city of ORLEANS (W-6442) was discontinued on 2 September.

The [illegible]th Engineer Water Supply Company, assisted by the 687th Engineer Water Supply Battalion of Advance Section Communications Zone, started on 5 September supplementing the water supply of the city of ETAIN (U-4770) by hauling an average of 55,000 gallons of water per day and delivering it to the water system. Approximately one-half million gallons of water were added to the city supply.

The water supply system of the city of NANCY (U-8611) was inspected and the water was declared unsuited for Army use for drinking and cooking.

By the end of the month, five Army water points and two water distribution points were furnishing approximately 140,000 gallons of water per day, including that supplied to the city of ETAIN (U-4770).

Water supply points were located in the close proximity of Evacuation hospitals, with the view of providing uninterrupted water supply to these units. Convalescent hospitals, Medical air evacuation holding units, and prisoner of war enclosures were supplied by haulage to their storage tanks.

VII - CAMOUFLAGE

On 1 September the four platoons of the [illegible]AP Company, 602nd Engineer Camouflage Battalion, were attached to [illegible] VIII, III, IV and XX Corps.

The operations of the platoons consisted of continuous inspection of corps units and divisions, making corrections, advising and assisting in camouflage matters. Their chief findings related to supply shortages. In order to correct deficiencies the supply situation was investigated and estimates submitted indicating material requirements for immediate use.

The company commander and technical sergeant camouflaur gave their attention to the camouflage of the area of Third U.S. Army Headquarters, making periodic aerial and ground inspections of the area. Interpretation of aerial photographs was the principal method of obtaining information relative to the camouflage of areas inspected, although during the latter part of the month, inclement weather made aerial inspection impossible.

On 5 September, a German camouflage net factory at SEMS (I-6965) was investigated, but because of lack of supervising personnel, it was not reopened.

On 16 September the second platoon reverted to company control from VIII Corps and was used in improving the camouflage of Rear Echelon of Army Headquarters. Improvement in the camouflage of the area was achieved by continuous inspection. It was found that inspection personnel achieved best results when they could show the personnel of units inspected aerial photographs of their own area.

The Camouflage Coordinator, European Theater of Operations, U.S. Army, inspected units of XX Corps.

On 21 September the survey of Army camouflage requirements was completed and an estimate submitted indicating requirements for the month and for a sixty-day period following. During the month the supply of camouflage nets was greatly increased by shipments from Advance Section Communications Zone, nets being obtained through turn-in by Advance Section Communications Zone and by increased supply from England and the United States.

On 23 September inspection of Rear Echelon of Army Headquarters revealed improvement in camouflage practice, although inclement weather had caused the area to become unduly marred and muddy.

On 30 September the 3rd platoon returned to company control after attachment to XV Corps.

Under the conditions prevailing at the end of September, with units quartered in towns, a change in camouflage policy and practice was necessary. These changes were dealt with by individual contact by inspection personnel, so that units inspected would learn the new principles involved when camouflage was practiced in towns rather than in wooded terrain.

VIII - FIRE DEFENSE

The Headquarters Sections and Type No. 2 units of both Engineer Fire Fighting Sections remained attached to Ordnance Groups for protection of Class V depots. The six type No. 1 units assisted the Quartermaster Gas Supply Companies, to which they were attached, in setting up fire defense and remained with them for fire protection.

In addition to the fire protection furnished, the commanders of the units inspected all ammunition supply points and assisted, when necessary, in setting up fire defense. Careful attention was given to preventive measures and no fires occurred during the month.

CHAPTER 5
OCTOBER OPERATIONS

I - OPERATIONS

There were very few major changes in the disposition of engineer troops throughout the month due to the static situation. The 130th Engineer General Service Regiment and the 1137th Engineer Combat Group remained in direct support of the XX and XII Corps and were, in turn, supported by the 130lst and 1303d Engineer General Service Regiments, respectively. The 1134th Engineer Combat Group continued its mission of coordinating depot hauling activities.

On 2 October the 178th Engineer Combat Battalion arrived from the NORMANDY Beach and was attached to the 1137th Engineer Combat Group.

On 5 October the 87th Engineer Heavy Ponton Battalion reverted from Seventh U.S. Army to the control of Third U.S. Army and was attached to the 1134th Engineer Combat Group.

On 8 October one platoon of the Light Equipment Company attached to the 1306th Engineer General Service Regiment was detached therefrom and attached to the 130lst Engineer General Service Regiment to equalize the equipment available.

At 152000A October Engineer Operational Instruction No. 14 was published. At this time major disposition of engineer troops remained unchanged. The 528th Engineer Light Ponton Company, 998th Engineer Treadway Bridge Company and the 3d Platoon, Company A, 602d Engineer Camouflage Battalion reverted from Seventh U.S. Army to the control of Third U.S. Army, effective this date, and the 1354th Engineer Dump Truck Company had arrived from the NORMANDY Beach.

Effective 18 October, changes in the attachments of the four Engineer Dump Truck Companies were effected to provide for the attachment of one Dump Truck Company to each of the three Engineer General Service Regiments and the Engineer Combat Group under Army.

At 231400A October Engineer Operational Instruction No. 15 was published effecting the above noted transfers and the attachment to the XX Corps of the 996th Engineer Treadway Bridge Company, which unit had been assigned Third U.S. Army from First U.S. Army, effective 20 October.

Starting 25 October, a three-day school in floating equipage to include construction of the Class 70 floating Bailey bridge, use of storm boats, tandem M-2 assault boats (powered), rafts and ferries, was commenced. A schedule was drawn up for all Army Engineer troops to attend, taking one battalion, or the equivalent, each three day period.

Effective 27 October, the 55lst Engineer Heavy Ponton Battalion was relieved from assignment to Third U.S. Army and assigned to Ninth U.S. Army.

The disposition of Engineer troops at 312400A October was as follows:

XII CORPS

II - CONSTRUCTION

The road maintenance work performed by engineer troops during the month consisted of cleaning out ditches to improve drainage, removing mud from surface of asphalt pavements, patching of raveled areas in these paved roads and the construction of access roads into bivouac areas and supply installations.

Some sections of pavement on main supply routes became badly raveled and "chuck holes" developed, which necessitated patching to insure the safe and continued smooth flow of supply traffic over these vital arteries.

To accomplish this necessary extensive patching, two central mixing plants were operated, one in the vicinity of ETAIN (U-4770) and the other at TOUL (U-6410). These two asphalt mixing plants produced several hundred tons of premix asphaltic patching material which was used on road repairs within reasonable hauling distance from the plants. Several German rolling kitchens were utilized as melting pots for asphalt and tar and the aggregate mixed by hand with this hot binder to supplement the production of the central mixing plants.

After utilizing all available crushed aggregate at the TOUL (U-6410) plant and in the absence of any available rock crus-r, an experimental patching mixture was developed, using pit-run sand-gravel and cement. The sand-gravel was excavated from a pit adjacent to the central mixing plant at TOUL (U-6410) and contained about the correct amount of water to hydrate and cure the cement. The only action necessary was to add cement to the pit-run sand-gravel and mix about forty-five seconds in the same rotary drum mixer as had previously been used for mixing asphalt and crushed gravel. Captured German cement was used for this purpose and proved successful as an expedient method of patching "chuck holes" in asphalt pavements.

The continued rainy weather during October necessitated a considerable amount of work at the entrances to bivouac areas and supply points, many of which had been located along main supply routes. This work was of two kinds: First, the mud carried onto the main highways had to be cleaned off continuously to prevent accidents resulting from the slippery roads; secondly, the access roads leading off the main paved highways had to be gravelled in order to prevent mud being carried onto the main roads and also to facilitate movement in and out of the otherwise muddy area. This work was a continuing task for all units because of the continued moving of units and the lack of sufficient engineer equipment to improve the situation at all points at once. In order to utilize the skills of engineer troops in more essential work, French civilians were hired to shovel the mud off the roads in most instances. Because of the vast amount of mud on the roads, it was also necessary to improvise plows and drags to help keep them clear. However, as the number of bridging projects was reduced toward the end of the month, more equipment became available for this purpose and good results were obtained by preparing access roads to areas ahead of occupancy.

Other engineer work consisted of removing mines and booby traps from roads and areas to be occupied by supply installations; also the repair of buildings and water systems of evacuation hospitals.

During the month, the following bridges were constructed by Army units:

Type	Number	Total Length-Feet
Bailey Bridges	17	2,300
Treadway Bridges	13	650
Timber Bridges	1	9,000
Infantry Support Bridges	1	200

Bridging operations in October required a relatively small amount of tactical bridging as compared with previous months, but a substantial amount of permanent bridging was constructed. The principal tactical bridges were the Bailey bridges constructed on the SEILLE River by XII Corps units. Since, however, the front line was so close to the MOSELLE River along the entire front, most of the bridges constructed to replace tactical bridging could well be called tactical bridging. Of the bridges constructed over the MOSELLE, the pile bridge at ARNAVILLE (U-7647) is perhaps the most noteworthy. It was an unusual day when work could proceed without interruption by artillery fire directed at the site. Though accurate at first to the point of damaging some of the unit's equipment, work could proceed without direct interference from shelling by re-establishing a smoke screen across the valley north of the bridge site.

2-WAY PILE BRIDGE OVER THE MOSELLE AT ARNAVILLE (U-7647) SHOWING SMOKE SCREEN IN THE BACKGROUND

When the forward movement of the Army temporarily stopped, the bridging situation was surveyed and immediate steps taken to replace all tactical and temporary bridging with high level permanent bridging. This work was the major task of all Army units during the month. It was well worthwhile, since a short period of high water, late in the month, indicated that the temporary low-level bridges would not have been capable of permitting an uninterrupted traffic flow. Ponton and treadway bridging, however, were held available for any contingency.

All the permanent type bridges were of pile bent construction and each one represented a distinctly individual task in its construction, first, because the number of pile drivers available was relatively small; secondly, the policy was to use all possible local materials, such as I-beams, lumber, etc. This policy, though requiring some ingenuity, worked out satisfactorily.

One casualty occurred during the month. An existing concrete civilian bridge at PEMPEY (U-8221), to which a military bridge had been connected, failed by the collapse of a concrete pier brought about by the swift water during a rise. Debris from the demolished section of the original bridge which had fallen into the stream, blocking a substantial part of the water opening and therefore imposing an unusual and severe scouring action on the already weakened member, was a contributing factor to its collapse. A completely new pile bridge is being constructed at an adjacent site.

During the month three other projects were engaged in, namely, the floating equipage school; the destruction of ETANG DE LINDRE Dam (Q-2832); and the establishment of a flood warning system in the MOSELLE watershed. The destruction of the ETANG DE LINDRE Dam (Q-2832) was done to prevent the enemy from creating a flood on the SEILLE River. The destruction of the dam was so carried out that a controlled flood was created, thus not damaging any military installations. A large measure of credit in providing this protection is due to the 1135th Engineer Combat Group, which unit took a major part in controlling the waters by judiciously sandbagging critical spots.

Since the watershed of the MOSELLE River is subject to serious flooding, a system of gaging stations was established, to be used for providing information needed both for planning of bridging and tactical requirements.

III - SUPPLY

Third Army Engineer Depot No. 8 at TOUL (U-6410) and Depot No. 7 at FRESNES (U-4657) continued in operation during the month. All classes of engineer supplies were stocked in Depot No. 8, but only Bailey bridging in Depot No. 7.

Because of the static tactical situation and the nearness of the Army Depot to the corps and forward army engineer depots were not established. [illegible] supply points containing bridging material

DECLASSIFIED

Digitized by Google

THIRD U.S. ARMY FORESTRY OPERATIONS

Lumber was also stockpiled in two lumber depots, one in the XII Corps area and the other in the II Corps area. The final issue of civilian and army vehicles was to the 3rd Replacement Depot. A high survival rate of vehicles was maintained by the army engineers. In addition maintenance instructions issued to the operating troops from the Third Army Engineer's office, was aimed to supply lubricants to give an assured safety factor of nothing.

Expendable items of engineer Class II supply were the hardest to secure. A serious impairment in the supply of saws and saw blades, and vehicle parts were evident. Only a part of these requirements received during the month. The supply of heavy equipment continued to be adequate. A shortage of mechanical power was encountered during the month, but local procurement of axles prevented this shortage from becoming a critical one.

Third Army Engineer Report No. 7 was issued on 30 October. The 113th Engineer Combat Group, with attached units, was used as the transporting agency for inter-theater movement of supplies, movement of

Third Army Air Corps dated 6 October (Annex No. 8). This circular contained new air distribution tables revised to accommodate new and special units.

Reproduction facilities included a battery of printing presses and lithographic equipment in the Army area. A total of 1,56 sheets of the 1:25,000 series were printed. Sixteen of these sheets were overprinted with the defense overprints.

The Army Map Depot handled approximately seventy tons of maps during the month. During the month liaison was maintained with the topographic unit of the army and with the Topographic Branch, Engineer Section, Twelfth Air Force, Army, in order to coordinate effectively the topographic functions of Third U.S. Army.

V - OPERATIONS

As the situation remained static during the month of October, the functions of the Directorate pertained to a matter of detail than previously. Measures were for specific areas and particularly of our immediate front, rather than long term army territory as theretofore experienced.

To assist in training in the Defenses of the MAGINOT Line, numerous French officers were interviewed and questioned. In addition French officers were secured for the purpose to provide first-hand information from those actually manning the defenses of the MAGINOT Line and also were well versed with the documents used.

The Air Liaison Officers were tasked with the supply personnel with air photographs of the [illegible] Sea and various documents pertaining to the terrain to enable them to arrive at a decision whether or not the [illegible] Division. This survey was also responsible for the preparation of wind data on the field warming system used in the Maginot Line area.

Considerable effort was exerted during the month to compile base maps of the Silver Star area for [illegible] sites. This was accomplished with a [illegible] photographic material on the [illegible] the assistance to the Army. Valuable studies in the way of [illegible] were completed by the Third Army Photo Center on individual target and [illegible] sites.

The Photo Center also furnished the First Special Mine Study as specified by this section, including sheet Nos. 5, 6, 7, 8, which was a photographic interpretation of proposed water supply routes from the present line to the Seine River.

Maps and aerial photographs witnessed the issuance of Engineer Intelligence Publication No. 1 and Engineer Information Notes No. 1 to all Third Army engineer units. The arrival of ill-supplied for a complete issue of [illegible] ultimately [illegible] ended for their areas and the issue for [illegible] already. The issue distribution of intelligence publications as mentioned, for a higher head, orders was also carried out to the proper [illegible].

[illegible] Castle of Luxembourg, Belgium, Texas left [illegible] Army [illegible] and [illegible] Third Army Corps [illegible] Engineering, the [illegible] and started a training program for the [illegible] with Army engineer units consisting of [illegible] demonstrations of [illegible] and [illegible] plans and [illegible] were also formulated [illegible] so that future training may be [illegible].

VI - WATER SUPPLY

The supply of water in the Army area during the month presented problems that [illegible] encountered during normal use. The [illegible] was a license, and high water caused heavy pollution in all rivers and streams.

Because of the inability of the portable units to produce more than [illegible] million of water in twenty-four hours of continuous operation at ten gallons per minute, and because it was impracticable, in many instances, to [illegible] over twenty-four hour periods, additional water points for additional water supply equipment for each portable unit. This additional equipment consisted [illegible] gallon tanks, canvas, storage, one filter unit [illegible] purification unit and two [illegible], trailer, fifty five gallons per minute. For the mobile unit, two 5,000 gallon tanks, canvas, storage, and one pump, 4 meter, 22 gallons per minute, were requested.

Twelve Army water points and four water distribution points for Army troops were opened during the month. The 113th Engineer Water

Digitized by Google

Supply Battalion, of Advance Section Communications Zone, assumed operation of one water point and First U.S. Army assumed operation of another. By the end of the month, four Army water points and four water distributing points were furnishing approximately 95,000 gallons of water per day. These points were operated by the two Army water supply companies. Medical air evacuation holding units and prisoner of war enclosures were supplied by hauling water to their storage tanks.

VII - CAMOUFLAGE

Camouflage inspections during the month were continuous. Failure to use wired paths and roads was one of the most common defects, with the result that some areas were badly treaded up. Most units showed need for additional garnishing in nets, and corrective measures were taken; however, because of the shortage of garlands, the process was slow.

Since most units other than front line were billeted, one of the principal functions of camouflage personnel was to render assistance in blacking out and in enforcement of blackout discipline.

VIII - FIRE DEFENSE

The Engineer fire fighting section's operations for the month were similar to those of previous months. Units remained attached to Quartermaster gas supply companies and Ordnance units operating Class III supply points, Class V supply depots, and railheads. They assisted in setting up fire defense at all of these types of installations and stayed at the installations to provide immediate protection. In addition to the fire protection furnished, the commanders of the sections inspected all ammunition supply points and assisted, when necessary, in setting up fire defense.

Advance Section Communications Zone moved the 1232d Fire Fighting Section into NANCY (U-8501) for protection of military installations established there during the month. One fire truck unit and one trailer unit were installed in the city, one on the west side of town and one on the east side. The other two trailer units of this section were located in TOUL (U-6410), mainly for protection of hospitals.

Arrangements were made for the NANCY (U-8501) civilian fire department to furnish assistance, if needed, in extinguishing fires in military installations. In turn, the military fire fighting units in NANCY (U-8501) were to assist the civilian fire department, when practicable, but would not assume responsibility for a civilian fire except insofar as it might affect a military operation or installation.

Careful attention having been given to preventive measures, no fires occurred in military installations during the month. Assistance in extinguishing fires was given to three trucks which caught fire from unknown causes near Class III Supply Point No. A1, located four miles southwest of NANCY (U-8501) on Highway N 74, and to one truck which caught fire while backing over smoldering trash at a trash dump located two miles west of TOUL (U-6410) on Highway N 4. Assistance was also given to extinguishing civilian fires consisting of a burning hay barn at ST. NICOLAS (U-9404), six miles south of NANCY (U-8501), a chimney fire in a civilian dwelling in NANCY (U-8501), and a burning shed in ST. MAX (U-8913), just northeast of NANCY (U-8501).

CHAPTER 6
NOVEMBER OPERATIONS

I - OPERATIONS

The major disposition of Engineer troops at the beginning of this period remained unchanged. The XX Corps was supported by the 1306th and the 1301st Engineer General Service Regiments in that order, while the XII Corps had the 1137th Engineer Combat Group and the 1303rd Engineer General Service Regiment for support. The 1134th Engineer Combat Group continued its mission of coordinating hauling depot stocks and experimenting with special river crossing equipment and devices.

Tactical guarding of bridges over the MOSELLE and MEURTHE Rivers from ARNAVILLE (U-7647) south to the Army boundary and a main supply route in the Army area, amounted to a considerable problem. Corps was made responsible for those bridges forward of its rear boundary, while Army troops were given those designated by the Army Engineer. Guard personnel required for the fifty-four bridges during the second week of November aggregated sixty squads daily; for the last two weeks of the month for the twenty-odd bridges, approximately twenty squads were needed.

At 141200A November, Engineer Operations Instruction No. 17 was published, effecting the following transfers and attachments:

1367th Engineer Dump Truck Company attached to 1134th Engineer Combat Group.
981st Engineer Maintenance Company attached to XII Corps.
88th Engineer Heavy Pontoon Battalion attached to XX Corps.
1006th Engineer Treadway Bridge Company to 1134th Engineer Combat Group.

On 15 November, Naval Unit N-2 reported to Army and was attached to the 1134th Engineer Combat Group the following day. At this time also the 633rd Engineer Light Equipment Company arrived from the NORMANDY Beach and the Company, less one platoon, was attached to the 1303rd Engineer General Service Regiment; the platoon was attached to the 1301st Engineer General Service Regiment.

During the latter part of this month, XX Corps was successfully reducing and at the same time by-passing the METZ (U-8656) forts. The 1306th Engineer General Service Regiment was actively engaged in bridging operations at THIONVILLE (U-8765) and METZ (U-8656) on the MOSELLE. To provide support for the advance of XX Corps to the east, the 1301st Engineer General Service Regiment was by-passed around the 1306th Engineer General Service Regiment and placed in support of the XX Corps; the 1306th Engineer General Service Regiment meanwhile prepared to take the line of the MOSELLE and to support the 1301st Engineer General Service Regiment. The missions of the 1137th Engineer Combat Group and the 1303rd Engineer General Service Regiment in the III Corps zone remained unchanged.

On 22 November, the 998th Engineer Treadway Bridge Company was attached to the XII Corps and on 25 November, the 1006th Engineer Treadway Bridge Company was assigned to the Ninth U.S. Army.

Disposition of Engineer troops as of 302400A November was as follows:

XII CORPS	ARMY
1119th Engr C Gp	1134th Engr C Gp
1135th Engr C Gp	1137th Engr C Gp
133d Engr C Bn	145th Engr C Bn
150th Engr C Bn	178th Engr C Bn
166th Engr C Bn	188th Engr C Bn
167th Engr C Bn	249th Engr C Bn
248th Engr C Bn	293d Engr C Bn
613th Engr L Equip Co	1301st Engr GS Regt
72d Engr L Pon Co	1303d Engr GS Regt
513th Engr L Pon Co	1306th Engr GS Regt
995th Engr Trdwy Br Co	609th Engr L Equip Co

664th Engr Top Co	
961st Engr Maint Co	
68th Engr Hv Pon Bn	
180th Engr Hv Pon Bn	
2898th Engr TIT (G)	
1st Plat, Co A, 602d Engr Cam Bn	

II - CONSTRUCTION

Roads and Bridges

Bridging activities of Third U.S. Army during November exceeded those of any previous month. Unusually heavy rainfall during this period twice flooded the MOSELLE Valley, washing out some bridges and inundating approaches. This required the construction of 120 Bailey bridges, 111 treadway bridges, sixty-five timber spans and two heavy pontoon bridges; Army units also built thirty-four culverts, light rafts and ferries, four Infantry support rafts and three foot bridges, a grand total of some four and one-half miles.

During the first week of this month, only semi-permanent timber bridging over the MOSELLE and MEURTHE Rivers was required at various points between ARNAVILLE (U-7647), PONT ST. VINCENT (U-7902) and LAMBYVILLE (U-8908). Bridges at VLAVIENY (U-8698), TOUL (U-6410), VANDIERES (U-7541), PAGNY (U-7544) and ARNAVILLE (U-7647) were completed, and an excellent network of crossings was available throughout the Army area. It was during the three following weeks that the bulk of the November bridging activities took place.

When the drives of the XII and XX Corps were launched, tactical bridging requirements were again taxed heavily. In the XII Corps zone, crossings were made over the SAAR and SEILLE Rivers, employing normal methods for such operations; however, the retreating enemy, capitalizing on the unusual precipitation, blew craters and culverts at such low spots that actual bridging was necessary to span these gaps. This resulted in an unusual expenditure of Bailey bridging, and at one time during the month, 3,900 feet of crossings of this type were in place in the XII Corps area alone.

In the XX Corps area, as part of the first phase of operations, the 5th Infantry Division was assigned the mission of encircling METZ (U-8658) from the south. This involved crossing the SEILLE and MOSELLE Rivers, and at the beginning of the operation, existing bridges over the MOSELLE at ARNAVILLE (U-7647), PAGNY (U-7544), VANDIERES (U-7541) and PONT-A-MOUSSON (U-7735) appeared adequate. Continued rains, however, caused other rivers in the area to rise to flood heights, the greatest since 1920, flooding the entire plain across the MOSELLE Valley, and washing out all bridges except the one at PONT-A-MOUSSON (U-7735), a high level structure. Even this bridge was temporarily out of use because of the unusual amount of rainfall, but this interruption was of short duration and did not materially affect the accomplishment of the assigned mission.

RISING WATER PILE BRIDGE OVER THE MEUSE RIVER AT TOUL

PILE BRIDGE AT TOUL TAKEN OUT BY FLOOD

PUMPEY BRIDGE OPENED TO TRAFFIC 6 NOVEMBER. WITHSTOOD ALL HEAVY FLOODS

On the north flank of the corps, the 90th Infantry Division was to cross the river and meet the 5th Infantry Division east of METZ (U-8658). Because of the flood, this juncture was delayed several days; initial crossings in the north sector were made in storm boats at CATTENOM (U-9291) and MALLING (U-9593), while a feint was made by the 95th Infantry Division at UCKANGE (U-8679). At CATTENOM (U-9291), an attempt was made to put in an Infantry support bridge, but the current was so swift that it was swept away. Soon thereafter, the water rose to such a height at the bridge site that the approaches were submerged three feet, the river overflowing the country side as much as three miles in places.

Meanwhile, the 99ist Engineers continued erecting a Treadway bridge at MALLING (U-9593) in spite of rising water and intermittent, well-placed artillery fire. With this bridge across and its abutment raised, trucks and supplies were loaded on trailers and towed across by prime movers with freeboards in excess of fifty-four inches until the water receded enough to allow normal passage of vehicles over the bridge.

TREADWAY BRIDGE AT MALLING

Enemy artillery, again firing on this crossing, destroyed eleven floats. Repair of the bridge was begun immediately, but the current tore it loose, carrying it a short distance away. Fortunately, only relatively minor damages resulted. Since the water was beginning to fall, it was then decided to construct a treadway ferry at this site, and approximately a battalion of armor was crossed by this means, when the ferry was hit by artillery fire and sank.

Another bridge was then started, but since the water was now receding quite rapidly, a bridge at CATTENOM (U-9291) was begun and was finished before the one at MALLING (U-9593). Construction at MALLING (U-9543) proceeded uninterrupted by artillery fire until the bridge was completed. It was then fired upon by enemy artillery, but was not hit.

M-1 TREADWAY BRIDGE OVER MOSELLE RIVER AT CATTENOM LENGTH 600 FT - PICTURE TAKEN DURING PROTECTIVE SMOKE SCREEN

FLOATING BAILEY BRIDGE AT CATTENOM WHICH REPLACED THE TREADWAY BRIDGE

During this period, with the water too high to permit use of bridges, supply and the evacuation of the wounded were effected by the use of storm, powered assault and utility boats, all of which proved invaluable expedients.

At THIONVILLE (U-8785), meanwhile, construction was started by the 1306th Engineer General Service Regiment on a 200-foot double triple Bailey bridge to span a gap on a destroyed highway bridge. The small bridgehead here was held chiefly by Engineer troops, but with their organic weapons they could not drive back the German mortars, long-range machine guns and artillery which kept up harrassing fire for thirty-six hours, despite a good smoke screen. This bridge was completed before two final bridges at MALLING (U-9593) and was used to cross part of the 10th Armored Division. To augment this crossing, and to provide a factor of safety, floating Bailey bridges were constructed at both THIONVILLE (U-8785) and at CATTENOM (U-9291).

At UCKANGE (U-8679), a heavy ponton bridge was built by the 69th Engineers to provide a crossing for the 95th Infantry Division. This site was the object of enemy artillery fire and actual construction was thus delayed for forty-eight hours.

After the fall of METZ (U-8658), the 180th Engineers built a heavy ponton bridge and several floating Bailey bridges over the MOSELLE to afford passage through the city.

ANOTHER BLOWN BRIDGE AT METZ SHOWING THE STARTING OF A BAILEY BRIDGE TO CROSS THE GAP

The above bridges had just been completed when a second flood, even greater than the first one, inundated the area. The crossings were maintained without loss, but their access roads were completely flooded and could not be used.

Rafts were used in the crossing at MALLING (U-9993), but were not too successful principally because the site was poorly suited to their employment. A steep hill rose from the river and made the construction of an adequate ramp impossible.

While actual bridge construction was the principal activity of Army engineer troops during this month, maintenance of roads was also a considerable problem. During the period, with excessive rainfall, mud on roadways constituted not only a hazard but did much to impede traffic.

The removal of mud tracked onto the surfaces of main supply routes by Army vehicles leaving bivouac areas, supply depots and parking lots was the largest single item under road maintenance. Road graders, improvised drags of logs and steel I-beam construction, were employed in this work. In some places, however, manual labor was required to shovel thin coats of mud from the road.

Although maintenance work on roads in the Army area consisted primarily in clearing mud from roads, repairing wearing surfaces, building new access roads and providing additional lateral and longitudinal drainage taxed the capabilities of general service troops.

Repairs to wearing surfaces of roads in the Army network were carried on as extensively as the weather and volume of traffic would permit. Excessively heavy traffic over most of the roads caused numerous pot-holes to develop and many of the edges began to ravel and crack. Such patching was accomplished by the operation of a "pre-mix plant," consisting of kettles improvised for mixing and heating asphalt and aggregate.

Access roads were constructed mainly in and near the military cemeteries at ANDILLY (U-6420) and LIMEY (U-6533), in addition to several approach roads to crossings, to supply depots, and to hospitals. This consisted principally of spreading and rolling gravel and stone on roads and parking areas.

To release engineer troops for more essential employment, French civilian labor was used extensively.

III - SUPPLY

Third U.S. Army Engineer Depot No. 8 at TOUL (U-6418) continued to operate as the principal depot servicing the Army. Bridging and lumber dumps were operated by the III Corps and XI Corps in their respective areas.

Army Engineer Depot No. 9 was established on 27 November in the vicinity of HELLACK (J-1754), to be used as an advance storage area for Bailey bridging and Engineer Class IV supplies.

Engineer depot stock was replenished from Communications Zone and Advance Section Communications Zone Engineer depots by both rail and Army truck transportation. A total of 1,728 tons was transported by Communications Zone rail and 2,429 tons by Army truck. All rail shipments were made to the TOUL (U-6418) railhead. Truck transportation of Engineer supplies was coordinated by the 1134th Engineer Combat Group with transportation from the following Engineer units:

87th Engineer Heavy Pontoon Battalion
293d Engineer Combat Battalion
548th Engineer Light Pontoon Company
558th Engineer Light Pontoon Company
1369th Engineer Dump Truck Company
1370th Engineer Dump Truck Company

On numerous occasions it was found necessary, because of congested rail conditions west of PARIS (S-0545), to dispatch Army transportation to Communications Zone depots in the NORMANDY Base Section. This long distance hauling by truck was found to be unsatisfactory and was suspended. The maximum economical hauling distance from Communications Zone and Advance Section Communications Zone depots to Army depots was found to be from 100 to 150 miles. To expedite the release, shipping and loading of critical supplies in the Communication Zone depots, it was found necessary to send officers to Communications Zone depots.

In [illegible] handling supplies forward from rear supply installations [illegible] Engineer Combat Group was responsible for the movement [illegible] railroad [illegible] points, the move-

DECLASSIFIED

vert of timber from civilian sawmills to engineer depots, and the movement of bridging materials to corps dumps. An estimated tonnage hauled of these items is as shown below:

	Short Tons
Collection of captured material	800
Movement of timber from sawmills	700
Movement of bridge material to corps dumps	2,100

The supply of bridge timber remained critical. Twenty-nine civilian sawmills produced a total of 1,500,000 board feet measure of timber for the Army. The civilian contractor Forestry Company, operating with two sawmills still units, delivered 900,000 board feet measure of bridge timber to the army, while a total of 600,000 board feet measure was received from civilian sawmills. This production was far below the requirements for the army, which was estimated at 2,500,000 board feet measure per month. Efforts were then made to increase production of civilian sawmills. The Eighth Corps Combat Group was assigned the mission of supervising all civilian mill operations. The Corps Engineer Forestry Supply Depot operated on a trade-in-for-duty basis to the army for timber. Only meager supplies of captured timber had been encountered during the month.

Items from Ordnance depots during the month were mainly items of assault river crossing equipment. As the result of battle losses, an acute shortage developed in the supply of assault boats, M-2, Infantry support rafts, foot bridges, wire rope, and wire rope clips.

The supply of spare parts and Class II Engineer items improved considerably. Spare parts for Mercedes bridge trucks were still nonexistent. Arrangements were made to supply spare parts to the IX Air Force. One officer and ten enlisted men were attached to the Spare Parts Platoon of the 49th Engineer Depot Company to assist in the storage and issue of additional spare parts.

RHINE River crossing requirements were compiled and assembling of equipment was begun. Contracts for the manufacture of the following special equipment was placed with civilian concerns:

Bridge bolts
Steel shovels
Hooks, spanner, treadway
Steel bearing plates
Pulley bows, Bailey bridge, ponton
Drift pins and bolts
Metal signs
Saddles, treadway bridge, M-2
Beizes, treadway bridge, M-2

The 778th Engineer Maintenance Company, in addition to the normal maintenance of Engineer equipment, manufactured the following equipment:

Assault boat pins
Traffic signs
Brackets for Bailey pontons
Screw plows
Pile driver attachments for 3/4 yard shovels

The principal problem of Engineer maintenance was that of maintaining generators in hospitals. To teach preventative maintenance, an inspection team was furnished by the 778th Engineer Maintenance Company and assigned the task of making periodic inspections of hospital generators.

Sufficient local supplies of steel "I" beams and piling were encountered to satisfy all fixed bridging requirements in these materials.

The 16 30th Engineer Gas Generating Unit, an Advance Section Communications Zone unit, was set up to generate oxygen and acetylene gas at Engineer Depot No. 8. This unit, together with civilian sources, supplied commercial gas to meet Third U.S. Army requirements and reduced a shortage which formerly existed.

Captured engineer material during the month consisted of steel "I" beams, sheet metal, utility supplies, hardware, wire rope, plywood, and electrical supplies. Reconnaissance parties continued to operate in corps and Army area. All usable supplies were concentrated in captured material collection points and placed under guard. One point was designated for each corps.

The average stock of Engineer supplies on hand in all Army engineer supply installations by classes during the month of November was as follows:

CLASS	TONNAGE (LT)
II	[illegible]
IV	12,195
V	473

IV - MAPS

Early in November recommendations were prepared for submission to the Commanding General, Twelfth Army Group, for providing each Army with map depot detachments similar to the one set up under T/BAE 5-500 on the basis of one per corps.

During the latter part of October specifications had been drawn up covering the revision of 1/25,000 maps, 5025 G, series, in the area assigned by Twelfth Army Group. This area covered the Army front east to the RHINE River, north of latitude 49° 16'. This project was turned over to the Army Topographic Battalion and covered the revision of the sheets with respect to woods, culture and major changes in hydrography. Intelligence photography at a scale of 1/10,000 was the main source of new information, supplemented by basic photo coverage at various scales ranging from 1/8,000 to 1/15,000. During the month twelve sheets were completed and reproduced and work was done on all the remaining fifty-three sheets. The addition of the woodland to the 1/25,000, 5025 G, series, in the Army area was completed during the month. This project was initiated in September, covered forty-seven sheets, and involved a color separation of the wooded areas.

Compilation and reproduction of a special road map, scale 1/250,000, was initiated during the month due to the lack of such a large scale road map in Germany. This map had many special features and is based upon the operational 1/250,000 5025 4346 series.

Requests for terrain models during the month were limited to the 1/50,000 scale pressed models secured through Twelfth Army Group.

Four conversion graphs for rapid conversion of German Gauss-Kruger rectangular coordinates to Theatre Nord de Guerre grid coordinates were prepared and published.

Total maps received during the month approximated thirty-five tons, or 779,000 sheets, while maps issued to Army units totaled fifteen tons, or approximately 285,600 sheets.

V - INTELLIGENCE

In the month of November the main concern was to obtain information on the SAAR Region for dissemination to all Army units concerned. Two original reports from the Office of the Chief Engineer, European Theater of Operations, namely, "Selected Routes in SAAR Territory" and "Special Reconnaissance in SAAR Territory" were distributed to Army units. Another study, "Special Road Study, Sheet U1, XE 831824EM" was prepared and issued to Army units. In addition, the ETO Report No. 47", "Crossings of the SAAR River," was received from the Office of the Chief Engineer, European Theater of Operations, and distributed.

Since units in the field were encountering more and more enemy minefields, distribution of various mine and booby trap charts was made. Two charts on mines, one on the Tellermine and the other on the Anti-Tank Topmine, were produced and issued.

Engineer Intelligence Notes Numbers 8 and 9, together with Engineer Intelligence Bulletin No. 7, were published and issued to all Army Engineer units.

In addition, for planning and future use, the section obtained and distributed various intelligence data and studies. Such studies included the "SAUER River Hydrology Study," "Effects of Snow on Roads in Southwest Germany Study," "Report on Water Supply of METZ," and "ML Pontoon Gear Equipment Manual". Also, Technical Bulletin No. 132, Office of the Chief of Engineers, "The Snake M-2" and Training Bulletin No. 23, "The Mark 2 Longer" were reproduced and issued to all Engineer units.

The 2899th Engineer Technical Intelligence Team continued to give lectures and demonstrations on German mines and booby traps to Third U.S. Army units for the first two weeks during the month. They then followed behind the advance of field units to examine captured German Engineer dumps. Upon discovery of the new German Anti-Tank Topf Mine, they proceeded to examine this mine and aided in the preparation of the Topf Mine Chart.

VI - WATER SUPPLY

During the month Army troops operated sixteen water points. The total consumption was approximately 3,000,000 gallons. Water was delivered to army hospitals and prisoner of war enclosures and supplying of water to the city of METZ (U-8658) was continued.

VII - CAMOUFLAGE

The five platoons of Company "A", 602d Engineer Camouflage Battalion engaged in various activities during the month. Headquarters platoon remained attached to Army, the first platoon was with IX Corps, the second and third with Army, while the fourth platoon was attached to the III Corps.

During this period, Headquarters platoon was engaged in re-garnishing, repairing and replacing camouflage nets belonging to Headquarters Third U.S. Army, and continued this project until all nets were brought up to the desired standard.

The first platoon was engaged principally in inspecting Field Artillery units. This included recommendations for improvement of concealment and suggestions for obtaining nets, of which there was found to be a shortage.

In addition to the above, the first platoon investigated the use of smoke, generated to screen engineer bridge building activities. The Commanding Officer of the 206th Engineer Combat Battalion was interviewed and his observations are reported here.

It was believed that better use could have been made of smoke screens than was possible with the limited equipment on hand at that time. Of eighteen smoke generators, twelve at a time were normally in operation for periods of from eight to ten hours. This small number of units, coupled with periodic shortages of fuel, was sufficient only to cover a small area, with a wind velocity in excess of two miles per hour, the screen thus produced was too thin to obscure observation.

The second platoon engaged in developing methods of snow camouflage for the 64th Fighter Wing. This method consisted of pattern painting of white shrimp nets with white and olive drab paint. The Wing had several radar installations on snowy ridges and had become definitely snow-camouflage-conscious.

The third platoon experimented with a two-piece hooded snow-camouflage suit of fabricated white muslin. It was estimated that the Army units would require 972 suits, based on one suit for each man of a twelve-man patrol per battalion.

The fourth platoon inspected Field Artillery units principally, checking especially on track-marks of organic vehicles. Nothing else of an unusual nature marked the activities of the unit during the month.

VIII - FIRE DEFENSE

Army fire fighting units were attached to Quartermaster gas supply companies and Ordnance units operating Class III, Class V and railhead installations. They assisted in setting up fire defense at these types of installations and furnished protection to gasoline, ammunition and other installations in the order of priority listed here.

The 1232nd Engineer Fire Fighting Platoon, assigned to Advance Section Communications Zone, furnished fire protection for NANCY (U-8461) and vicinity. This platoon also assisted Army in providing protection for Class III installations when they were too numerous and widely separated for immediate protection to be given completely by Army units.

With a view to requirements for closer protection of Class III and V installations when they are located in Germany, arrangements were made with Advance Section Communications Zone for them to assist in furnishing protection for these installations as required in future operations.

Seven fires occurred, none of which resulted in serious military damage.

CHAPTER 7
DECEMBER OPERATIONS

I - OPERATIONS

The major disposition of Engineer troops at the beginning of this period was essentially the same as in the past, with the exception that the 1301st Engineer General Service Regiment completed by-passing the 1306th Engineer General Service Regiment and was in support of XII Corps and was, in turn, supported by the 1306th Engineer General Service Regiment. In the XII Corps zone the 1137th Engineer Combat Group remained in support of the XII Corps and was, in turn, supported by the 1303rd Engineer General Service Regiment. The 1134th Engineer Combat Group continued its mission of coordinating depot haulage activities and experimenting with special river crossing equipment. Complete disposition of troops was as follows:

XII CORPS	III CORPS
1117th Engr C Gp	296?d Engr TIT (C)
1135th Engr C Gp	
111?rd Engr C Bn	ARMY
150th Engr C Bn	1134th Engr C Gp
166th Engr C Bn	1137th Engr C Gp
167th Engr C Bn	149th Engr C Bn
248th Engr C Bn	188th Engr C Bn
613th Engr L Equip Co	178th Engr C Bn
72d Engr L Pon Co	249th Engr C Bn
513th Engr L Pon Co	293d Engr C Bn
995th Engr Trdwy Br Co	1301st Engr GS Regt
997th Engr Trdwy Br Co	1303d Engr GS Regt
998th Engr Trdwy Br Co	1306th Engr GS Regt
673d Engr Top Co	609th Engr L Equip Co
981st Engr Maint Co	632d Engr L Equip Co
553rd Engr Hv Pon Bn	673d Engr L Equip Co
2897th Engr TIT (C)	548th Engr L Pon Co
4th Plat, Co A, 602d Engr Cam Bn	528th Engr L Pon Co
	976th Engr Maint Co
	572d Engr Dp Trk Co
XI CORPS	764th Engr Dp Trk Co
1103d Engr C Gp	776th Engr Dp Trk Co
1139th Engr C Gp	1364th Engr Dp Trk Co
135th Engr C Bn	1369th Engr Dp Trk Co
160th Engr C Bn	1370th Engr Dp Trk Co
179th Engr C Bn	87th Engr Hv Pon Bn
204th Engr C Bn	652d Engr Top Bn
206th Engr C Bn	459th Engr Depot Co

88th Engr Hv Pon Bn	2890th Engr TIT (R)
180th Engr Hv Pon Bn	Naval Unit N-2
2898th Engr TIT (C)	
1st Plat, Co A, 602d Engr Cam Bn	

On 3 December the advance of both the XI and XII Corps was proceeding satisfactorily to the northeast and at 1800A that date Engineer Operational Instruction No. 19 was published, establishing new areas of responsibility for Army engineer troops. Missions remained unchanged.

On 5 December the III Corps became operational with the mission of completing the reduction of the remaining forts at METZ (U-8658). In order to provide Engineer assistance, the 1306th Engineer General Service Regiment, which was supporting the 1301st Engineer General Service Regiment, was given the additional mission of supporting the III Corps.

On 9 December the push of the XI and XII Corps to the northeast continued and III Corps mission remained unchanged. Engineer Operational Instruction No. 20 was published on this date at 1800A establishing new areas of responsibility for Army engineer troops. Mission remained unchanged.

On 11 December the 1134th Engineer Combat Group started two-day schools for 22½ horsepower outboard motor operators to provide a minimum of 110 operators per letter company of at least two battalions of the 1137th Engineer Combat Group. Because of operational activities, only one company at a time could be sent to this school. The school closed 13 December after instruction had been provided to the lettered companies of the 188th and 249th Engineer Combat Battalions of the 1137th Engineer Combat Group.

On 14 December the reduction of METZ (U-8658) had been completed, and the III Corps was assigned a zone of action in the center of the Army zone. On this date at 1800A Engineer Operational Instruction No. 21 was published establishing new areas of responsibility and shifting the 1306th Engineer General Service Regiment from support of the 1301st Engineer General Service Regiment to support the III Corps and attaching the 178th Engineer Combat Battalion to the III Corps.

On 15 December the 676th Engineer Light Equipment Company arrived from the beach and was attached to the 1303rd Engineer General Service Regiment. The 633d Engineer Light Equipment Company (less 2d platoon) was detached from the 1303rd Engineer General Service Regiment and attached to the 1301st Engineer General Service Regiment.

By 19 December the drive of the Germans in the EASTERN (P-5558) area had split the First U.S. Army and reached such proportions that the III Corps, which had not yet become actively engaged on the SAAR River front, was shifted to the north in the ARLON (P-6122) area. To provide engineer support for its drive, the 1137th Engineer Combat Group with the 145th, 188th and 249th Engineer Combat Battalions, the 770th Engineer Dump Truck Company, the 632d Engineer Light Equipment Company, the 995th Engineer Treadway Bridge Company, and the 72d and 513th Engineer Light Pontoon Companies from the XII Corps, were all attached to and moved into the zone of the III Corps. The 1303rd Engineer General Service Regiment was placed in support of the XII Corps. The VIII Corps, had had been on the south flank of the first U.S. Army, was cut off and came under operational control of Third U.S. Army, together with its corps engineer troops of two Combat Group Headquarters, four Combat Battalions, one Light Equipment Company, two Light Pontoon Companies, one Topographic Company and one Technical Intelligence Team (Combat). Two of the VIII Corps Combat Battalions, the 168th and 44th, were badly mauled, suffering fifty and seventy-two percent casualties, respectively, and were no longer effective.

On 20 December the 183rd Engineer Combat Battalion, which had arrived from the beach and had been temporarily attached to the 1303rd Engineer General Service Regiment, was detached therefrom and attached to III Corps. The 553rd Engineer Heavy Pontoon Battalion and the 998th Engineer Treadway Bridge Company were detached from XII Corps and attached to the 1134th Engineer Combat Group.

On 20 December the German drive had reached break-through proportions, and the XII Corps was shifted from its westward drive and moved to the LUXEMBOURG (P-8413) area, facing north. The Sixth U.S. Army Group took over the area vacated by the XII Corps, and the 1117th Engineer Combat Group, with the 167th and 248th Engineer Combat Battalions, passed to their control.

On 21 December operational activities of the XII Corps to the north in the LUXEMBOURG (P-8413) area necessitated withdrawal from the XI Corps, which corps had the mission of holding the SAAR River line in their zone, of the 1103rd Engineer Combat Group, 160th Engineer Combat Battalion, 204th Engineer Combat Battalion, 909th and 537th Engineer Light Pontoon Companies, and the 996th Engineer Treadway Bridge Company and their attachment to the XII Corps.

On 23 December the 998th Engineer Treadway Bridge Company was relieved of attachment to the 1134th Engineer Combat Group and attached to III Corps to support its operations. To provide haulage facilities for engineer Class II and IV supplies forward to the new area of operations, the 88th and Company "B" of the 180th Engineer Heavy Pontoon Battalions were detached from the XI Corps and attached to the 1134th Engineer Combat Group.

On 24 December the 991st Engineer Treadway Bridge Company (less one platoon) was detached from XI Corps and attached to the 1134th Engineer Combat Group for refitting and placed in Army reserve.

On 25 December the situation had become somewhat stabilized and Engineer Operational Instruction No. 22 was published at 0900A effecting the above noted changes. At this time the VIII, III, and XII Corps were abreast on the ARLON (P-6122)-LUXEMBOURG (P-8413) line facing north and the XI Corps was on the right flank along the SAAR River facing northeast. The 1303rd Engineer General Service Regiment was in support of the XII Corps, the 1306th Engineer General Service Regiment was supporting both the VIII and III Corps and the 1301st Engineer General Service Regiment was patrolling the majority of the Army area with priority of work being to support the XI Corps barrier plan. The 262d Engineer Combat Battalion reverted to Third U.S. Army from First U.S. Army and was attached to VIII Corps.

On 26 December, the 974th Engineer Maintenance Company reverted from First U.S. Army to Third U.S. Army and was attached to VIII Corps.

On 27 December, the 243d Engineer Combat Battalion arrived from the port of ROUEN (W-1915) and was attached to the III Corps.

On 28 December, the 991st Engineer Treadway Bridge Company (less 1st platoon) had completed refitting and was attached to the VIII Corps.

On 29 December, the 88th Engineer Heavy Ponton Battalion (less Company "B") was alerted and moved to XII Corps, effective 31 December, to support contemplated operations.

On 30 December, the 44th and 168th Engineer Combat Battalions, which had been badly mauled during the initial break-through, were detached from VIII Corps and attached to the 1134th Engineer Combat Group for reorganization and refitting. To offset this loss and furnish Engineer support for projected operations, the 243rd Engineer Combat Battalion was detached from III Corps and attached to VIII Corps.

On 30 December, the 996th Engineer Treadway Bridge Company and the 995th Engineer Treadway Bridge Company were interchanged between the XII and III Corps, respectively, in order to support an interchange of Armored Divisions.

On 31 December, the light equipage platoon of the 72d Engineer Light Ponton Company was detached from the III Corps and attached to the XII Corps to build up engineer means of the XII Corps for contemplated operations.

II - BRIDGES AND ROADS

During December the amount of bridging constructed by Third U.S. Army engineer units was in excess of 20,000 feet, despite the fact that during the last fifteen days of the month very few bridges were put in, since the changed tactical situation existing after 15 December involved mass troop movements principally over bridges previously constructed. An analysis of the bridging is as follows:

TYPE	NUMBER	LENGTH IN FEET
Bailey Bridge (Fixed)	101	7,660
Heavy Ponton Bridge	2	700
Infantry Support Bridge	4	1,000
Timber Bridge	122	7,810
Treadway Bridge (Fixed)	80	2,810
Treadway Bridge (Floating)	7	1,210
Total	316	21,190

In addition to this construction more than a hundred culverts were repaired, over 1,000 feet of footbridges were constructed, and twenty or more rafts of various types were constructed and operated. Three floating bridges over the MOSELLE River constructed in November were also maintained during this period.

The chief water obstacles encountered during the month were the SAAR, NIED, and BLIES Rivers and their tributaries. All of these streams were more of an obstacle than would normally be expected, inasmuch as the incessant rains had raised them to flood stage. The flooding in XII Corps zone was further aggravated by numerous small lakes formed by the dams that had been constructed as part of the SIEGFRIED Line. To alleviate the flooding from this cause, many of these dams were destroyed when captured. The enemy utilized the high water by extensive cratering of the roads and destruction of culverts on a scale greater than any previously encountered.

The major assault river crossing operation of the month was that engaged in by XI Corps on the SAAR River. With the exception of the extraordinarily fortunate seizure of the main highway bridge at SAARLAUTERN (Q-2804) shown in photograph below, every other attempt to cross or to bridge the river was strongly contested by the enemy.

HIGHWAY BRIDGE ACROSS SAAR RIVER AT SAARLAUTERN

Digitized by Google

The bridge at SAARLAUTERN (q-[illegible]) was taken in a secret night crossing by assault elements of the [illegible] Infantry Division, and though it was an excellent bridge, it was never of any great value as a crossing, since as soon as the Germans discovered that it had been captured, they began a barrage of direct observed artillery fire from the high ground on the east bank of the river of such intensity that practically no traffic could make the crossing.

To overcome this restriction, an infantry support bridge and a footbridge were constructed at a nearby site, but both of these were destroyed by direct artillery fire before any value could be derived from them.

Concurrently, crossings were attempted at DILLINGEN (q-[illegible]) and infantry troops were successfully crossed, but the attempts to put in a treadway bridge were repulsed by enemy artillery fire.

The only tactical bridge that remained in for any appreciable time was an infantry support bridge at LISDORF (q-2879), which remained in for thirty-six hours before it was knocked out by enemy artillery fire.

Similar bridging attempts were made at SAARLOUIS (q-2862), FREMTEN (q-2584), and DILLINGEN (q-2784), but all were equally unsuccessful because of the intensity and accuracy of the artillery fire. Losses in personnel and equipment were extremely heavy at all these crossings.

During the entire operation, from the time the first troops were loaded until the operation was suspended, because of the changed tactical situation existing after 15 December, rafts and boats, usually operated at night, served as the only supply and reinforcing line across the river.

Of the tactical bridges constructed during the month, the largest was the double-triple Bailey bridge at HEMMELTDORF (q-1783), shown in the photograph below.

180-FOOT DOUBLE TRIPLE BAILEY BRIDGE OVER SIEG RIV AT HEMMELTDORF

At the end of the month, due to the changed tactical situation, activity in XII Corps consisted of maintaining and holding the bridgehead at SAARLAUTERN (q-2882) and DILLINGEN (q-2784). No further major crossings were attempted.

In XII Corps once no single line proved to be so defensible as the SAAR line in XX Corps, but the crossing of the SAAR and BLIES were strongly contested at every point.

The most important bridge and the most difficult to build was the 160-foot double single Bailey bridge at SARREBRUCHEN (q-5454), shown in the photograph below. This bridge was built under direct artillery fire, and work had to be stopped many times because of the intensity of the fire.

At SAARALBE (q-4844), a heavy pontoon bridge was initially constructed for the crossing of the 35th Infantry Division, and a floating treadway was put in over the BLIES River at REICHEIM (q-4959).

About 22 December, the XII Corps was shifted to a new area of operations as a result of the changed tactical situation, and from this time until the end of the month bridging did not play an important part in these operations.

Tactical bridging constructed by III and VIII Corps was incidental to other operations and did not involve any major tasks during

period. The bridge constructed over the SAAR [illegible] River at FLORENVILLE (P-4676) is shown below:

BAILEY BRIDGE OVER SAAR RIVER AT SARREBRUCHEN

BRIDGE OVER THE SEMOIS RIVER AT FLORENVILLE

The major part of new permanent timber bridging was contained generally in the areas between the MOSELLE and SAAR Rivers, though a small amount of bridging was accomplished in the LUXEMBURG (P-6413) area as the month drew to a close.

In the following photographs are shown typical examples of the bridges constructed:

TIMBER TRESTLE BRIDGE OVER MOSELLE RIVER IN METZ

DECLASSIFIED

PILE BENT BRIDGE OVER SEILLE RIVER IN METZ

PILE BENT BRIDGE OVER MOSELLE RIVER AT TWINVILLE

Since the river was about 300 feet wide at this point, the timber bridge was constructed from the remains of an existing timber bridge in the foreground at an angle, over to the remains of the old stone bridge to which the Bailey is connected. This solution saved a substantial amount of lumber and piling, since by doing this, the amount of bridging required was cut from 400 feet to 200 feet.

TIMBER TRESTLE BRIDGE AT FRIESTROFF OVER NIED RIVER

TIMBER TRESTLE BRIDGE OVER SAAR RIVER AT SAAR UNION

PILE BENT BRIDGE OVER SAAR RIVER AT SAARALBE

TIMBER TRESTLE BRIDGE OVER NIED RIVER AT LANDROFF

Maintenance work on bridges, for the most part, consisted of driving piles for ice fenders, replacing bracing members weakened by flood waters, depositing additional rip rap around the base of bents that had begun to scour, regrading and resurfacing approaches that had been damaged under the impact of excessively heavy traffic.

Most of the road work undertaken during the month consisted of maintenance of main supply routes. New roads constructed were mainly access roads to Ordnance depots, supply points, hospitals and military cemeteries. Mud on the highways did not constitute the problem it presented in November, since falling temperatures and frozen ground lessened the amount of mud tracked on the roads.

Maintenance work on roads included filling in craters, sweeping roads and shoulders for mines, repairing blown culverts, reconnaissance for new routes, stockpiling sand along main highways in anticipation of ice conditions and the preparation of drags and plows for removal of snow from the roads.

III - SUPPLY

During the first half of December major efforts were devoted to the accumulation of special equipment for the RHINE River crossings. A considerable number of items were procured from local sources. The status of certain issue items required for this project, however, remained critical. This was especially true of light equipage. The MOSELLE River crossings had proved extremely costly and all units were short this equipment to meet their requirements. During the latter part of the month some small shipments were received and some table of equipment shortages were filled.

A concerted effort was made by the 1134th Engineer Combat Group to place all available civilian sawmills in production. A noted increase in output of bridge lumber was the result. Communications Zone furnished an officer for the purpose of assisting in the procurement of lumber and he proved to be a material help. A release was obtained from Communications Zone for two million board feet of lumber from Southern Line of Communications for the month of December. An Engineer platoon was dispatched the latter part of the month to load out by rail, and shipments against this release were started. Another release for three million board feet of lumber was received for January. Two corps dumps were taken over by Army, using depot personnel. These dumps were stocked with Bailey bridging and lumber.

As the result of the enemy penetration on 17 December, the axis of supply for Third U.S. Army was altered by approximately ninety degrees. This resulted in large quantities of supplies being shipped by rail and truck in order to meet the situation. A Class IV dump was selected in the vicinity of ESCH (P-7301) and a Class II and IV depot site was selected at ARLON (P-6122). Supplies were generally moved in sufficient quantities and in time to satisfy the troops. Large demands for explosives and fortification materials were made. It is estimated that 400 tons of explosives were issued during this period. Several large stocks of captured fortification materials were available for immediate issue.

Large demands were received for snow suits and white camouflage paint. Production of suits by civilian mills was initiated, using the supervision of Company "A", 602d Engineer Camouflage Battalion. Carbide slag was found to be suitable for use as white paint. This slag is being supplied to all units from local sources.

IV - MAPS

During the month approximately sixty tons of maps were received. Approximately fifty-seven tons were issued to Army and corps units.

Sixty-three sheets of revised editions of the G503 AAA series, scale 1/25,000, were declared operational by Third U.S. Army during the month.

Because of the sudden breakthrough of enemy forces on the left flank of Third U.S. Army and the resulting change in the Army boundary, the following corps and divisions were mapped during the period 18 December to 28 December for an area previously north of Army boundary: III, VIII, and XII Corps; 4th, 5th, 26th, 28th, 35th, 80th, and 87th Infantry Divisions; 4th, 6th, 10th and 11th Armored Divisions; 17th and 101st Airborne Divisions.

On 19 December, III Corps opened their map depot at ARLON (P-6122) with instructions from Army to temporarily service all units in the area, even though they were not under corps control.

On 20 December arrangements were made with Twelfth U.S. Army Group temporarily to use the Communications Zone Advance Map Depot

Digitized by Google

at VERDUN (U-2865) for servicing directly Third U.S. Army troops. A standing operating procedure was established on 22 December for operating under this temporary arrangement without losing control of the critical stock available in the new Army area.

On 25 December the advance Third U.S. Army map depot was opened at LONGWY (P-5905) to service Third U.S. Army troops in the usual manner. The temporary arrangements for servicing Army units made with the III Corps map depot at ARLON (P-6122) and the Communications Zone Advance Depot at VERDUN (U-2865) were discontinued. Although the Army Map Depot at NANCY (U-6411) was closed as a distributing point on 29 December, it was retained as a temporary storage point for maps that were not of immediate interest to Army.

The recent change in Third U.S. Army operational area necessitated a considerable enlargement of the current reproduction program. No 1/25,000 map stocks were available in the new area, which meant that entire Army reproduction facilities had to be thrown into the task of providing immediately the sheets needed for the new operation. Difficulty was encountered during the first few days in obtaining complete sets of medallions for sheets immediately required, and it was found necessary to reproduce some of them in monochrome only. In no case were three sheets printed with a green medallion, inasmuch as First U.S. Army did not make that color separation. To date, sixty-six sheets of this new area have been printed and distributed. Quantities printed ranged from 10,000 to 18,000 copies of each sheet.

During the month several requests for papier mache pressed models, scale 1/50,000, were received and filled. An order for three terrain models, scale 1/25,000, covering the RHINE River from BINGEN (B-1252) to MANNHEIM (B-5798) was placed with the Engineer, Twelfth U.S. Army Group. The first model of this series was received and later turned over to Sixth U.S. Army Group because of changes in the tactical boundaries.

V - INTELLIGENCE.

For the major portion of the month this section was able to concentrate on engineer intelligence data on enemy equipment new to troops of Third U.S. Army. This new data took the form of enemy engineer equipment, such as the "J-Feder 50A" (Time Delay Igniter), German Anti-Lifting Device (Entlastungszunder) and "Tarnlade" (Explosive Coal). The first two items were encountered in the area of the Seventh U.S. Army. Charts were produced and distributed to all Army units on these three items, while further details were given in Engineer Intelligence notes and bulletins published by this section.

In the course of the rapid change of the tactical situation, information was obtained and disseminated to cover the Army's new area of responsibility. A road and bridge study, scale 1/500,000, covering eastern Belgium, Luxembourg and Western Germany to the RHINE River was also prepared and distributed.

To aid the corps engineers and commanding officers of Army Engineer Combat Groups in preparing for the crossing of the RHINE River, the section obtained and distributed such studies as "RHINE River Study (RI 10)", RHINE River Hydrology Study (Office of the Chief Engineer, European Theater of Operations) and a "Study of Bind Characteristics Along the RHINE River." In addition, in conjunction with the Third U.S. Army Photo Interpretation Detachment, a dossier of certain bridge sites on the RHINE River was completed. This dossier included photo interpretations, traces, stereopairs and other data taken from French documents for each bridge site. This study was distributed to each corps engineer and commanding officer of the Army Engineer Combat Groups.

During the month Engineer Intelligence Notes No. 10 and Engineer Intelligence Bulletins Nos. 8, 9, and 10 were produced and distributed to Army engineer units.

The 3970th Engineer Technical Intelligence Team (Research) concerned itself mainly with experimenting with equipment to detect the "J-Feder 50A." In turn, it also gave lectures, prepared and distributed posters and charts to front line troops who were encountering these devices. Reports of these experiments were furnished the A.C. of S, G-2, Third U.S. Army, and to higher headquarters. Other items of enemy engineer equipment with which the team concerned itself were the Tarnhohle (Explosive Coal), the adapters used with French Light Anti-Tank Mine Igniters, and the Artillery Shell Mine.

VI - WATER SUPPLY

During the month Army troops operated twenty water points. The total water treated was approximately 4,000,000 gallons. Operation of three Army water points was assumed by Advance Section Communications Zone. Deliveries of water to Army hospitals and prisoner of war enclosures were made by the 151lth and 1512th Engineer Water Supply Companies. Supplying of water to the city of METZ (U-8658) was continued.

Ever since arriving on the Continent, it has been realized that the standard method of treatment of water outlined in existing field manuals was not satisfactory on the Continent. Because of the danger of the presence of cysts of endamoeba histolytica in the water supply sources which were not completely removed in ordinary methods of treatment of water by the use of the Army water supply set, a modification of the sets and general treatment method were adopted. After considerable time and experimentation, this new method of treatment was adopted by the entire European Theater of Operations and is covered in Headquarters European Theater of Operations Technical Training Bulletin No. 30, dated 1 January 1945.

In this treatment, the first precautionary measure taken is to allow one hour for the coagulation, settlement and prechlorination of the raw water. Another precautionary step is the reduction of the output of the water purification units. The portable unit is operated at a rate of not more than ten gallons per minute, while the mobile unit may be operated at a rate of not more than sixty gallons per minute. The method of treatment of water, using the table of equipment portable unit, is as follows:

(1) Raw water is drawn from the source by the pump and passed through the purification section, where it is chlorinated to at least two parts per million and placed in a floc tank, a 3,000 gallon canvas tank, where floc is formed by the addition of alum and soda ash.

(2) The floc tank is allowed to stand for one hour and then the water is drawn off through the filter by a booster pump at a rate not to exceed ten gallons per minute if one filter is used, or twenty gallons per minute if two filters are used.

(3) The water is stored in a second tank for dispensation to units. The water being dispensed has a residual chlorine content of 1/4 parts per million or greater. The water being dispensed has a chlorine content of two plus parts per million. Rechlorination is performed at the clear tank if it is necessary in order to keep the content up to the required level.

(4) All rates of flow are measured by watch and container, as the pressure gauges on the filter cannot be relied upon for accuracy. The sand in the filter unit is inspected at frequent intervals to insure the presence of the proper amount of sand. The filter is backwashed with water from the clear tank at a rate of fifteen to twenty gallons per minute. One filter unit has a maximum output of 12,000 gallons per day for twenty hours operation.

(5) With the use of an additional floc tank, it is possible to settle one batch of water for an hour in one tank while the other is being drawn through the filter.

(6) If greater demand is placed on the water point, two units are used in parallel.

(7) The optimum pH of the water is determined by the "jar test" and is used for determining the coagulation treatment required and to test for the presence of chemical warfare agents.

(8) Samples of treated water are submitted to Medical Laboratories for analysis monthly or at least at each change of source of water supply.

(9) Records of amount of water produced and the residual chlorine content at dispensing points are kept on an hourly basis. Mobile units are capable of producing 72,000 gallons in a twenty-hour period.

VII - CAMOUFLAGE

The two primary missions of the Camouflage Company during the month were pattern painting of vehicles and production and distribution of snow suits.

Pattern painting of vehicles for snow camouflage was accomplished with the use of the residue from the generation of acetylene gas, a lime-like substance found in dump piles in a dry state which, when mixed with water and applied with brushes as a thick paste and allowed to dry, provides a white coat which is not injurious to metal or tarnage. The material washes off with water and chips off to a certain extent, but is entirely satisfactory for the purpose. Three sources of supply were available: One operated by the 1st platoon, located with the 644th Engineer Topographic Company at THIONVILLE (U-6705); one operated by the 4th platoon, located with III Corps at LUXEMBOURG (P-6413); and one at Engineer Depot No. 13. Sufficient material was available at these sources to satisfy army requirements.

A two-piece snow camouflage suit with hood and ties around the waist, wrists and ankles was designed, to be manufactured in two sizes in order to satisfy size requirements for the majority of men. Material was secured from civilian sources in Belgium, in addition to Army sources. Five civilian factories were employed; three located in HERVES-MAISONS (U-7903) produced approximately 1,000 suits per day; one located at HATANGE (U-7883) produced approximately 100 suits per day and was operated by XX Corps; and one located in LUXEMBOURG (P-6413) and operated by III Corps furnished 1,000 suits per day. In addition, three Quartermaster salvage companies were producing suits, together with two Chemical Warfare Maintenance units. Approximately 800,000 meters of material were obtained, enough to produce 130,000 suits. By the end of the month 7,847 suits had been produced, and 1240 suits were received from the Quartermaster which were considered satisfactory for issue. In addition, XII Corps had produced approximately 3,400 suits for their own use in the LUXEMBOURG (P-6413) factory, from which Army received 50% of the output.

At the end of the month, the 1st platoon was attached to XX Corps, the 2nd platoon was split into two groups, one on duty with VIII Corps and one assisting in the camouflage of the 563d Signal Aircraft Warning Battalion; the 3rd platoon was split, one group with III Corps, and one group inspecting and assisting in camouflage of the LUXEMBOURG (P-6413) area; and the 4th platoon was attached to XII Corps.

VIII - FIRE DEFENSE

Army Fire Fighting units were attached to Quartermaster gas supply companies operating Class III installations to provide immediate protection. They also assisted in setting up fire defense at Class V and railhead installations.

The 1232d Engineer Fire Fighting Platoon (Advance Section Communications Zone) furnished fire protection for NANCY (U-6501) and vicinity. This platoon also assisted Army in providing immediate protection for Class III installations when they were too numerous and widely separated for immediate protection by Army units. Advance Section Communications Zone also assisted Army in giving immediate protection to some Class V installations.

Fire protection for LUXEMBOURG (P-641) and vicinity was furnished by the LUXEMBOURG (P-6413) City Fire Department, which is very capable and cooperative, and by the fire truck unit attached to the 1092d Engineer Utilities Detachment of this headquarters.

One major fire occurred when enemy aircraft strafed decoming point No. 438, located at HAMC ZEULLES (U-6678), France on 22 December. Approximately 100,000 gallons of gasoline were destroyed out of 800,000 gallons at the dump. Twenty minutes after strafing the dump, planes returned and strafed men fighting the fire.

CHAPTER 8
JANUARY OPERATIONS

I - OPERATIONS

The major disposition of Engineer troops at the beginning of this period remained unchanged. The 1306th Engineer General Service Regiment remained in support of the VIII and III Corps, the 1303d Engineer General Service Regiment in support of the III Corps, the 1301st Engineer General Service Regiment in support of the XX Corps and the 1134th Engineer Combat Group continued its mission of coordinating depot hauling activities and experimenting with special river crossing equipment.

On 2 January the 282d Engineer Combat Battalion arrived from the port of ROUEN (M-1916) and the 993d Engineer Treadway Bridge Company reverted from Sixth U.S. Army Group and both units were attached to XII Corps to support its contemplated northward drive.

Effective 3 January the 961st Engineer Maintenance Company was detached from XX Corps and attached to III Corps to provide maintenance facilities for that corps. On the same date Company "B" of the 180th Engineer Heavy Pontoon Battalion was detached from the 1134th Engineer Combat Group and attached to XX Corps to provide necessary heavy bridging. The 1129rd Engineer Combat Group arrived from the port of ROUEN (M-1916) and was attached to III Corps.

Engineer Operational Instruction No. 23 was published on 3 January establishing new areas of responsibility.

The 280th Engineer Combat Battalion arrived from the port of ROUEN (M-1916) and was attached to III Corps effective 7 January. The 187th Engineer Combat Battalion and the 281st Engineer Combat Battalion arrived from the port of ROUEN (M-1916) on 8 January and were attached to XX Corps effective 10 January to rebuild engineer means in that corps for the establishment of barrier zones.

The 1152d Engineer Combat Group arrived from the port of ROUEN (M-1916) on 10 January and was attached to XX Corps. In order to provide necessary bridging support for a shift in armored divisions, the 993d Engineer Treadway Bridge Company was detached from XII Corps and was attached to XX Corps effective 12 January, and the 1st Platoon of the 991st Engineer Treadway Bridge Company was detached from XX Corps and attached to VIII Corps. In addition, the 998th Engineer Treadway Bridge Company was detached from III Corps and placed in Army reserve under the 1134th Engineer Combat Group on 13 January.

On 13 January the Light Equipage Platoon of the 72d Engineer Light Pontoon Company was detached from XII Corps and returned to its parent unit under III Corps, since the contemplated operation of the XII Corps failed to materialize.

Engineer Operational Instruction No. 24 was published on 15 January. The 249th Engineer Combat Battalion arrived from the port of ROUEN (M-1916) and was attached to XX Corps on 16 January. In order to provide maintenance facilities for XX Corps, the 2d Maintenance Platoon of the 961st Engineer Maintenance Company was temporarily attached to XX Corps.

Because of renewed operational activities of the XII Corps, the Light Equipage Platoon of the 72d Engineer Light Pontoon Company was released to XII Corps on 18 January on a temporary basis. In order to provide bridging support for the 4th Armored Division, which was released to XII Corps on 16 January, the 995th Engineer Treadway Bridge Company passed from the control of Third U.S. Army and was assigned to the Sixth U.S. Army Group on 19 January.

By 21 January the 44th and 168th Engineer Combat Battalions had refitted and reorganized to the extent that they were once again operational and were reattached to VIII Corps. The "bulge" was being effectively reduced and VIII and III Corps were pivoting to the east, with the XII Corps driving to the north. An inter-Army boundary between First and Third U.S. Armies on the north and inter-Group boundary between Twelfth and Sixth U.S. Army Groups were established effective 22 January. Engineer Operational Instruction No. 25 was published on the same date establishing new areas of responsibility.

On 22 January the 168th Engineer Light Pontoon Company, which had been performing hauling, was detached from the 1134th Engineer Combat Battalion and attached to the XX Corps for tactical operations. To offset this loss of hauling facilities, the 72d Engineer Light Pontoon Company was detached from III Corps and attached to the 1134th Engineer Combat Group. Engineer Operational Instruction No. 26 was published on 27 January.

II - ROADS AND BRIDGES

By far the largest single item of engineer road work performed was the maintenance required to keep the roads in the Army area open. Numerous, although light, falls of snow kept the road network covered for the entire month. Prompt and efficient snow removal from the main supply routes by Engineer units, using snow plows, drags, and borrowed civilian rotary plows, assured an uninterrupted circulation of traffic. This was of vital importance, since during the month there was a very large amount of regrouping and relocation of tactical units.

M-4 Caterpillar on Arsdorf-Boulade Road Clearing Snow Drifts

M-4 Caterpillar Tractor Clearing Snow on Arsdorf-Boulade Road

Sub-freezing temperatures were experienced throughout practically all of January. This necessitated constant and continued sanding of those stretches of road where icing conditions were most likely to prevail. Most of this sanding was done in the manner shown in the photograph below, where the sand was spread manually over the surface of the road by men walking behind the upraised body of slow-moving dump trucks.

Application of Sand to Road Just North of Route Les Ell, Luxembourg

In addition to this, roads were maintained, cleared and sanded--many times on a twenty-four-hour basis of operation for Army supply points, air strips, hospitals, and ammunition depots.

A total of 1,100 miles of road was thus maintained. Concurrently with this snow and ice removal program, many road craters were filled, stretches of newly captured roads were swept for mines, and anti-tank ditches filled.

The amount of semi-permanent timber bridging erected during the month was considerably less than in December. A compilation of the total amount of all bridging is as follows:

TYPE OF BRIDGE	NUMBER	TOTAL LENGTH IN FEET
Fixed Bailey Bridges	50	3,770
Floating Bailey Bridges	2	960
Fixed Treadway Bridges	37	1,412
Floating Treadway Bridges	2	280
Timber Bridges	53	2,721
Heavy Pontoon Bridges	1	160
Infantry Support Bridges	12	-

One of the most important timber bridges built was the one constructed by the 1306th Engineer General Service Regiment on Route N-51, north of FLORENVILLE (P-2525) over the SEMOIS River near MESNIL (P-3824). This was a 118-foot, one-way, Class 70 - two-way, Class 40 bridge that opened additional main supply routes for both III and VIII Corps.

Bridge Site Route N-51 Vicinity of Mesnil

Completed Bridge Route N-51 Vicinity of Mesnil

Other timber bridges were built in the area to the east of METZ (U-8658) in ROUZONVILLE (J-1378), and KEDANGE (U-9879), permitting the release of Bailey bridging. Two eight-foot Bailey bridges on the main supply route through ETTELBRUCK (P-8240) were replaced by one-way, Class 70 - two-way, Class 40 timber spans by the 1303rd Engineer General Service Regiment.

Under construction at that time was a timber bridge to replace two Bailey bridges over the MOSELLE River in METZ (U-8658), and a timber trestle overpass on Route N-418 on the railroad tracks in THIONVILLE (U-8685).

Digitized by Google

The principal streams encountered by the III and VIII Corps in their drive to close the ARNSDORF salient were the ERKEN and the L'OGNON Rivers and their tributaries. Two of the largest tactical bridges built by corps engineer troops in this sector were the 100-foot triple-single Bailey bridge constructed by the 1306th Engineer General Service Regiment over the ERKEN River in the vicinity of FLORENVILLE (P-2525) and the 110-foot triple-single Bailey bridge built over the L'OGNON River near ORTHEVILLE (P-4366), built by the 202d Engineer Combat Battalion.

Because of the static condition of the front, an appreciably smaller amount of tactical bridging was placed in the XX Corps area during this month than during the previous month. The only bridge of any appreciable size erected in this sector was the floating Bailey bridge constructed at ECKANCH (Q-6679) to replace the heavy pontoon bridge at this point. The remainder of the bridges consisted mainly of short Bailey and treadway bridges of from twenty to fifty feet, built over road craters and blown culverts.

The bulk of tactical bridging of any outstanding size was accomplished by the XII Corps engineer units in their sector of the ARNSDORF salient. These bridges were constructed principally over the SAUER and SURE Rivers and their tributaries in the vicinity of DIEKIRCH (P-8742) and ETTELBRUCK (P-8240) to support the assault crossings of these rivers by elements of the 5th and 80th Infantry Divisions. Every bridge in ETTELBRUCK (P-8240) was destroyed by the retreating enemy, necessitating the construction of four Bailey bridges.

This system of bridges consisted of two eighty-foot, double-single Bailey bridges, one ninety-foot, triple-single Bailey bridge, and one 130-foot, double-double Bailey bridge.

Eighty-Foot Double Single Bailey Bridge South of Ettelbruck on Route N-26

Eighty Foot Double Single Bypass Bailey Bridges over Sure River

130 Foot Double-Double Bailey Bridge over Railroad Tracks and Ninety Foot Triple-Single Bailey Bridge over Sure River in Ettelbruck

Just north of ETTELBRUCK (P-8240) in the vicinity of GOSSELDANGE (P-7648), the 1135th Engineer Combat Group put three Bailey bridges over the SURE River to support the advance of the 5th Infantry Division. These three tactical crossings consisted of one 110-foot, triple-single Bailey bridge, one 130-foot, double-double Bailey bridge, and one 140-foot, triple-single Bailey bridge.

At DIEKIRCH (P-8742), further east of ETTELBRUCK (P-8240) on the SURE River, the 1135th Engineer Combat Group erected a 160-foot heavy pontoon bridge, and in GILSDORF (P-8842), the next town on the same river, Engineer troops constructed a 144-foot infantry support bridge and a 120-foot treadway bridge. This treadway bridge was damaged by artillery fire on the morning of 20 January, killing several men, and has since been replaced with a 140-foot, double-double Class 40 Bailey bridge.

160 Foot Treadway Bridge Over Sure River At Diekirch

144-Foot Infantry Support Bridge Over Sure River at Diekirch

120-Foot Treadway Bridge South of Diekirch over Sure River Damaged by Artillery Fire - Built by 1135th Engineer Combat Gp

[illegible] further east within the tactical bridging was put across the river at [illegible]. They were a forty-foot, single-single [illegible], a 140-foot, triple-single Bailey bridge and an [illegible] bridge. In addition to the aforementioned [illegible] bridges, numerous smaller [illegible] were constructed over blown culverts and craters.

Tactical bridging was also necessary in such isolated towns as HALSDORF-DONNELDANG (P-7216), ESCH SUR LA SURE (P-7047), and LUTZHAUSEN (P-6747), which towns are located in the mountainous area lying to the northwest of ETTELBRUCK (P-8240).

Ninety-Six Foot Treadway Bridge on Route 15 at Heiderscheidergrund

Eighty-Foot Double-Single Bailey Bridge at Esch Sur La Sure

Seventy Foot Double-Single Bailey Bridge at Lutzhausen

Also during the month XII Corps engineer troops constructed a 360-foot Class 40 floating Bailey bridge at ECKERICH (Q-0198) over the MOSELLE River to replace the ferry that had been in operation at this point.

XII [illegible]

The [illegible] of engineer equipment to the Army during the month of January [illegible] of [illegible] tactical bridging, [illegible] of tactical bridges and [illegible] equipment. Every available [illegible] tion of engineers were used to [illegible] bridges for [illegible] in forming a barrier in the [illegible] of enemy breakthroughs. Large quantities of barbed wire and [illegible] were issued for [illegible] tions.

Digitized by Google

As the result of battle losses, it was necessary to re-equip two divisions, four Engineer combat battalions, one Engineer light equipment company, two Engineer light pontoon companies and a number of Field Artillery units.

Large demands were made on the Army depots for battle replacements for Class II Engineer supplies, particularly Engineer sets. Many of these requirements were filled with material evacuated from Advance Section Communications Zone Engineer Depot E-513 at LIMAUMONT (P-3149) at the time that this depot was in danger of being overrun during the enemy winter offensive. Without the supplies thus obtained, serious lack of equipment shortages in combat units would have remained unfilled at a critical time in the tactical situation.

Good quantities of heavy equipment were released from Advance Section Communications Zone depots during the latter part of the month. After being issued to troops, this equipment practically completed the reorganization of all combat battalions in the Army.

Lumber requirements and productive capacity of all Armies were discussed at a meeting held by Communications Zone. The purpose of the meeting was to coordinate the supply of lumber between Armies. It was decided that Third U.S. Army should continue to receive lumber from Southern Lines of Communication to augment other sources. The first shipments of previously allocated lumber from Southern Lines of Communication were received at Army depots during the last half of January.

Because of limited bridge building activities early in the month, depot stocks of tactical lumber increased to over a million board feet. However, toward the end of the month, heavy issues sharply reduced this stock.

Average stocks of engineer supplies on hand in all Army depots during the month were:

Class II - 625 long tons
Class IV - 13,500 long tons
Class V - 720 long tons

Class II and Class IV were issued from Depot No. 14 at ARLON (P-6412), while bridging and tactical lumber were issued from Depot No. 13 at ESCH (P-7901). An advanced dump, supporting III and VIII Corps and stocking bridging and lumber, was opened at BASTOGNE (P-5244). For the first time during operations, civilian labor was employed in Army Engineer depots. A total of sixty men were continuously employed at Depots Nos. 13 and 14.

All Engineer supplies except heavy equipment were delivered to Army Engineer depots by rail. Heavy equipment was moved forward mostly by Army trucks. In a few instances, movement of supplies was made by Advance Section Communications Zone trucks. Inter-depot movement of supplies and delivery of lumber from sawmills to depots continued to be handled by the 113th Engineer Combat Group, to which unit the following organizations were attached:

87th Engineer Heavy Pontoon Battalion
553d Engineer Heavy Pontoon Battalion
249th Engineer Combat Battalion
548th Engineer Light Pontoon Company
528th Engineer Light Pontoon Company
136th Engineer Dump Truck Company
1370th Engineer Dump Truck Company

Approximately 1,630 tons of Engineer supplies were moved to Army Engineer depots from Communications Zone during the month. Army trucks transported 1,864 tons of Engineer supplies to Army Engineer depots, excluding inter-depot movements.

During the month the amount of maintenance required on Engineer equipment was gradually increasing. This was attributed to normal wear and tear resulting from continuous use of the equipment. At a meeting of all commanding officers of Engineer maintenance companies of Third U.S. Army, a standard procedure was established whereby Engineer maintenance companies would act in the capacity of sub-depots for second echelon spare parts for units which they serve. With the exception of certain components of second echelon spare parts and tools for repair sets, the supply of spare parts was adequate.

During the month, a total of fifty-nine contracts were processed. The majority of these were in connection with items necessary for camouflage, modification of bridges and RHINE River requirements. Contracts which involved the fabrication of any items were complicated by the fact that most contractors were lacking stock or raw materials.

In the fabrication of the M-2 treadway saddles, twenty-two separate contracts had to be processed in order to procure the materials necessary for their construction. All of this material had to be hauled by Army transportation and delivered to the contractor. In addition to this, the contractor had to be supplied with coal for the forges, carbide for the production of acetylene, and welding rod. To procure these items, it was necessary to process additional contracts with civilian firms, using Army transportation for delivery to the contractor.

The fabrication of treadway supporting spacers involved additional problems. Since the production of these required overtime work, it was necessary to secure the approval of the French labor officials. Authority for the consumption of additional electric power for the contractors also had to be arranged for through French officials.

The production of oxygen, acetylene, nitrogen and carbon dioxide were less complicated, but still involved the procuring of raw materials and use of Army transportation. Either coke or carbide was required by the contractors for the production of these gases. The residual from the production of acetylene was found to be satisfactory for camouflaging of vehicles.

Materials for snow suits were procured from contractors in PARIS (S-0544), EPINAL (T-0413) and BRUSSELS (J-6255), together with some local firms.

IV - MAPS

No new mapping was undertaken during January. Work consisted primarily of revision of existing maps.

A color separation project of the GSGS 4414 series of maps in the Third U.S. Army zone of advance was undertaken. It consisted of seventy-nine sheets and involved the separation of woodlands. Eighteen sheets of this project were completed and prepared for reproduction.

Five sheets of the GSGS 4414 series were revised, color was separated, and the maps prepared for reproduction. The Army Topographic Battalion was plotting defense overprints from photographs annotated by the Army Photo Center. The plotting of this data with respect to the basic map was accomplished by means of reflecting projectors.

A map distribution table for an armored division was prepared on the basis of Third U.S. Army map allowances to facilitate distribution to divisional units by the division map depot.

The reproduction program consisted primarily of 1/25,000 scale maps. A total of 114 sheets were reproduced in quantities ranging from 10,000 to 18,000 each, a total of approximately 1,687,000 copies.

Ninety-four gelatin reproduction jobs were turned out for a total of 5,375 copies.

Terrain model requests were limited to the 1/50,000 scale pressed papier-mache type. These models were secured from the Office of the Chief Engineer, Headquarters Communications Zone.

The Army Survey Center performed several miscellaneous survey missions, including a telephone pole line and radar sites. The river gauges at TOUL (U-6410) and METZ (U-8658) were re-established on the normal null elevations.

V - INTELLIGENCE

The task of obtaining new data on bridges and bridge sites on a different sector of the RHINE River was commenced. This information was to be maintained in the form of a dossier with stereopairs of the bridge and bridge sites, photo interpretations and traces to include the road net on both the east and west banks of the river.

Various studies such as "Leveling System on or near the RHINE River," "Road and Bridge Study, East of the RHINE River," "Climate of Southern Germany," were distributed to interested units. Engineer Intelligence Notes No. 1 and Engineer Intelligence Bulletin Nos. 1, 2, and 3 were produced and distributed to Army Engineer units.

The 2690th Engineer Technical Intelligence Team (Research) continued to search for and examine German engineer equipment. Such equipment as the new type magnetic shape charge, three kilogram demolition charge, "Bruttstreamer," and portable flamethrower were examined. The team also gave lectures and demonstrations on mines and booby traps to several Engineer units.

VI - WATER SUPPLY

During the month Army troops operated fourteen water points and five water distributing points. Army water points produced approximately 3,650,000 gallons of water during this period. The 151th and 1512th Engineer Water Supply Companies delivered water to prisoner of war enclosures and Army hospitals. Supplying of water to the city of METZ (U-8658) for civilian consumption was discontinued after the city system had been repaired.

VII - CAMOUFLAGE

Pattern painting of vehicles for snow camouflage was continued, and by the end of the month approximately ninety percent of all armored vehicles had been painted.

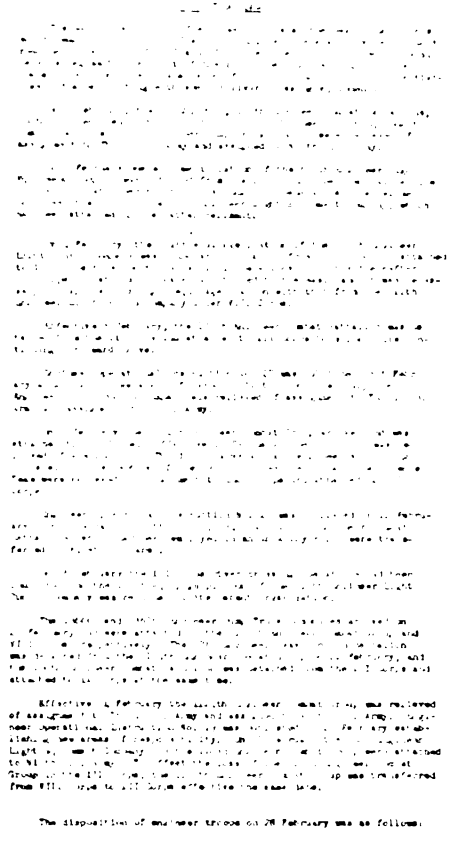
The production of snow camouflage suits was speeded up as much as possible so that by the end of the month approximately 50,000 snow suits had been issued.

The problem of camouflaging radar installations was difficult because such installations were of necessity situated in open fields on high ground. The best that could be hoped for was to make the site less conspicuous by paying particular attention to track discipline. In a typical case of camouflaging a Signal Aircraft Warning Battalion, the entire installation, except the sounding devices, was covered with a steel net, well garnished and spray painted white. The result was an inconspicuous white mound which gave ample room for movement, thus concealing traces in the area. The sounding devices which rotated continuously and a few scattered sheds were painted white. Tracks leading to the area were kept to a minimum and vehicles were parked in the nearby woods. Additional snowfall was advantageous, because the snow piled up on the mound to add to the illusion.

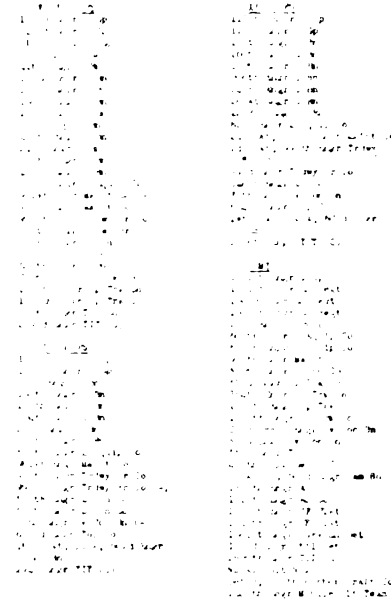
Inspections were carried out continuously and reports submitted periodically. The units inspected show a marked interest in winter camouflaging and did their best to act upon all recommendations made. To effect camouflage in their areas, pattern painting, dispersion and strict track discipline were practiced.

VIII - FIRE DEFENSE

Army fire fighting units were attached to Quartermaster gas supply companies operating Class III installations to provide immediate protection. They also assisted in setting up fire defense at Class V and railhead installations and were available on call to give assistance throughout the Army area.



Advance Section Communications Zone provided only a very small amount of immediate protection to Army installations, since units formerly employed in the Army area were required for their own use during the German counterattack.



Fire protection for LUXEMBOURG (P-8413) and vicinity continued to be furnished by the LUXEMBOURG (P-8413) City Fire Department and the fire truck unit attached to the 1092d Engineer Utilities Detachment of this Headquarters.

200-Foot Bailey Bridge Across Our River at Roth

120-Foot Bailey Bridge Across Our River South of Roth

Following this crossing, the advance was pushed eastward through extremely rugged country with steep-sided rocky cliffs toward the PRUM River. The advance in this area was impeded by numerous craters, and in some sectors as many as six fixed treadway or Bailey bridges had to be constructed in a single mile.

As the advance continued, Bailey bridges and footbridges were constructed over the PRUM River at ORSFELD (L-0652), BETTINGEN (L-0450), and PEFFINGEN (L-0446).

Bailey Bridge Across Prum River at Bettingen

Bailey Bridge Across Prum River at Peffingen

A rapidly advancing column of the Fourth Armored Division overran and captured a bridge across the NIMS River at RITTERSDORF (L-1156), as shown in the photograph below:

Bridge Across Nims River at Ritterdorf

By the end of the month the advance to the east had temporarily subsided and strong advances were being made astride the PRUM, NIMS, and SAUER Rivers toward the south. A heavy pontoon bridge was constructed across the MOSELLE River at WORMELDANGE (L-0413) as a lateral route between XII Corps and XX Corps.

DECLASSIFIED

Heavy Pontoon Bridge Across Moselle River at Bormeldange

On the north of the Third U.S. Army front, VIII Corps' direction of advance lies more particular to the courses of the [illegible] and SAAR Rivers, and though their assault crossings were not so costly, the rugged terrain with streams flowing in practically all of the valleys, required a large amount of Bailey bridging. Bailey bridges over the [illegible] River were constructed at [illegible], RIESCHEID (L-8667), DASBURG (L-8472, OBERANVEN (L-8678), BOUR-MEILAN (L-8478) and three bridges at AUEL (L-8886).

Bailey Bridge Across Our River at Ettelbruck

Bailey Bridge Across Our River at Oberhausen

Bailey Bridge Across Our River at Burg-Reuland

Bailey Bridge Across Our River at Auel

Second Bailey Bridge Across Our River at Auel

Third Bailey Bridge Across Our River at Auel

South of the MOSELLE River, 12 Corps, which had been holding the SAARLAUTERN (L-2880) bridgehead, suddenly crashed through the switch position of the SIEGFRIED Line running from METTLACH (L-1800) to MERZIG (P-0104) and raced up the triangle between the MOSELLE and SAAR Rivers, crossed the SAAR, and at the end of the month threatened TRIER (L-2129).

The breakthrough of the SIEGFRIED Line by the 94th Infantry Division and the 10th Armored Division was aided by a daring crossing of the MOSELLE River by the 5th Rangers, which unit crossed the stream near WORMELDANGE (L-0413) and made a very successful diversion of the main effort. Following this crossing a floating treadway bridge was constructed at REMICH (P-0106).

Floating Treadway Bridge Across Saar River at Remich

When the forces reached the SAAR, a crossing was attempted by the 94th Infantry Division near TABEN (L-1805) and SERRIG (L-1609). This was so successful that a treadway bridge could be put in at TABEN (L-1805) at an early hour.

Treadway Bridge Across Saar River at Taben

Digitized by Google

DECLASSIFIED

Another treadway bridge was constructed at SERRIG (L-1609) and this bridge was successfully maintained intact in spite of enemy fire.

Treadway Bridge Across Saar River at Serrig

Farther north in the vicinity of SAARBURG (L-1513) and OCKFEN (L-1614), another assault crossing was executed. When the bridgehead had been expanded sufficiently, two heavy pontoon bridges were constructed there.

One Way Traffic
Heavy Pontoon Bridges Across Saar River at Saarburg

Hazardous bridging experiences during the month were the removing and salvaging of four floating Bailey bridges from the MOSELLE River. Because of the sudden breakup of the ice on the river, high flows stretching completely across the stream swept down and damaged several of the floats.

In addition to tactical bridging, timber trestle bridges were erected in close support of corps. The 130Sd Engineer General Service Regiment built a number of permanent timber bridges to support III Corps operations. At DIEDENDORF (P-9742) a fixed timber bridge was completed over the SAUER River on 3 February.

At BOLLENDORF (L-0140) a 285-foot timber trestle bridge over the SAUER River was completed and opened to two-way Class 40 traffic on 19 February.

285-Foot Timber Trestle River over Sauer River at Bollendorf

A 230-foot timber trestle bridge was constructed across the SAUER River at REISDORF (P-9642) in five days, the bridge being opened to all types of military traffic on 20 February.

At ECHTERNACH, even before the Bailey bridge was completed, a two-way pile bent bridge was started on 21 February. When completed, this was a 670-foot bridge.

Timber Trestle Bridge at Ucsange

Roads

Road maintenance, repair and reconstruction work during the month was a much greater engineering task than that of any previous comparable period. Frost action during the early part of the month rendered many miles of roads impassable, particularly in the VIII Corps sector and the vital supply routes in support of this corps.

All available engineer troops were used on road maintenance and reconstruction work. In addition, approximately 3,000 civilian laborers and 550 prisoners of war were employed with hand tools to open drainage ditches and to assist in repair of road failures.

General Construction

General construction included building and maintaining liaison air strips and laying landing mats thereon; construction of prefabricated shelters and command posts for infantry troops; constructing gun emplacements and digging in searchlight units; clearing fields of fire for artillery; and leveling and sanding a firing range.

Repair and maintenance of buildings used by XX Corps Rest Camp, and buildings occupied by the 107th Evacuation Hospital, 110th Evacuation Hospital and by the 7th and 65th Field Hospitals were carried on.

Two hundred duckboards for M-1938 footbridge were constructed during the month. Road marking signs and traffic direction signs were made and painted.

III - SUPPLY

The change in the tactical situation from one of defense to that of offense resulted in the issue and expenditure of large quantities of river-crossing equipage. This reduced materially the Army reserve of this equipment being accumulated for the projected RHINE River crossing. Battle losses in assault boats and power utility boats contributed most in reducing the reserve.

As the result of the deterioration of main supply routes in forward areas, demands were made on depots for road materials, graders, rock crushers, road rollers and sheepfoot rollers. With the exception of rock crushers, most equipment was obtainable from Army and Advance Section Communications Zone. The shortage of rock crushers was generally offset by the production of crushed rock from civilian crushers.

Materials and equipment for the RHINE River crossing continued to be assembled. Shortages still existed, but indications were that the majority of equipment would be available in sufficient time for the operation.

As in the previous month, large quantities of heavy equipment were received from Advance Section Communications Zone depots and issued to troops. Sufficient shops, motorized, general purpose, were received to complete the equipping of all Engineer Combat Battalions, including Armored Battalions.

Four heavy cranes ranging in capacity from 1½ to 2 cubic yards arrived and were issued to General Service Regiments. They were primarily intended for use in the RHINE River crossing operation; however, they proved very helpful in the erection of fixed bridges currently under construction, in addition to giving the crews of these regiments a chance to become familiar with the operation of these cranes.

Heavy equipment not available in quantities required included rock crushers, small cranes, tar kettles and road graders, both towed and self-propelled. Requirements for these items were particularly high because of road deterioration.

Another effect of the bad road condition was a tremendous demand for picks and shovels used by civilians to supplement labor on the road program. Depot stocks of these items were soon exhausted; however, quantities sufficient to handle the situation were acquired by borrowing from Ordnance and by emergency pick-ups from Advance Section Communications Zone and Communications Zone depots.

To meet the requirements for crushed rock, three civilian crushers were operated at full capacity. These crushers all utilized blast furnace slag which was crushed and loaded in rail cars for shipment to forward railheads. Daily capacities of these plants were:

Plant No. 1	270 tons
Plant No. 2	460 tons
Plant No. 3	440 tons

Depot stocks of small Class II items, such as hammers, hatchets, files, welding and cutting sets and small tools in general, reached a dangerously low level. This condition was largely the result of the non-receipt of items requisitioned from Communications Zone. Toward the end of the month increasing quantities of supplies were being delivered from Advance Section Communications Zone Depot R-517T and Depot No. R-514. This materially relieved the Class II shortage.

Quantities of lumber received and issued during the month were as follows:

Acquired from local civilian mills	534,792 BFM
Supplied by 139lst Engineer Forestry Company	216,547 BFM
Received from Southern Lines of Communications	102,350 BFM
Consumed in bridge construction	780,567 BFM

An increased demand for heavy I-beams (15" to 24" in depth with lengths up to 52 feet) was noted during the month. It was possible, however, to supply all requirements.

DECLASSIFIED

Digitized by Google

The majority of engineer supplies were delivered to Army depots by rail. Rail facilities were available at Engineer Depot No. 13 for bridging and lumber and at Engineer Depot No. 14 for Class II supplies. Approximately 5,031 tons of engineer supplies were received by rail from Advance Section Communications Zone and Communications Zone Depots.

Considerable Army rail transportation was utilized for the movement of engineer supplies, consisting mainly of lumber, steel I-beams and road materials from Army Depots to Advance engineer depots serving corps.

Approximately 11,866 tons of engineer supplies were moved by the 1134th Engineer Combat Group, using transportation of the following engineer units:

553d Engineer Heavy Pontoon Battalion
88th Engineer Heavy Pontoon Battalion
567th Engineer Light Equipment Company
293d Engineer Combat Battalion
1366th Engineer Dump Truck Company

Transportation of supplies consisted of hauling logs to civilian saw mills, moving lumber from sawmills to engineer depots, transporting heavy engineer equipment from Advance Section Communications to Army depots, and moving supplies forward to advance engineer supply points.

The amount of maintenance required on engineer heavy equipment continued to increase, resulting in a large number of dead-lined machines. This situation was relieved considerably with the location of an engineer base shop company of Communications Zone approximately forty miles in the rear of the Army depot. Prior to this time it had been necessary to send equipment needing fourth and fifth echelon repairs approximately 200 miles to the rear. An adequate supply of spare parts and table of equipment replacement equipment were available to the Army.

During the month a total of sixty-one contracts were processed by the Purchasing and Contracting Section. The majority of these contracts were for RHINE River project material and modification of present bridging equipment. Contracts for a total of 11,000 treadway supporting spacer bars were placed with civilian firms. By the end of the month 2,500 had been delivered to engineer depots.

Contracts for the modification of seven Bailey bridges were placed with civilian firms. Two bridges were completed during the month. A total of 43,000 tons of crushed slag was contracted for. Approximately 10,000 tons were shipped to forward areas by rail.

A list of major items under contract at the end of the month follows:

ITEM	QUANTITY
Anchors	293
Brackets, outboard, assault boat, M-2	100
Brackets, outboard, treadway ferry	50
Guard, finger, Bailey bridge	250
Modification of Bailey bridge parts:	
Clamps	294
Ramp, bottom	55
Ramp, plain	84
Sway Brace Extension	190
Transoms	200
Parts for Bailey bridges:	
Bolt, chord	1,000
Pin, panel	1,000
Shoes, pile, cast steel	1,200
Supporting spacer bars, Treadway M-2	7,000
Transom spacing blocks for Bailey bridge	100

IV - MAPS

No new mapping was undertaken during the month. All mapping consisted primarily of revision of existing maps.

The color separation project, GSGS 4414, was completed during the month. Third U.S. Army units now had available three-color maps throughout the entire Army area at a scale of 1/25,000. Two sheets were revised and prepared for reproduction during the month.

In the Army area east of the RHINE River a project consisting of the selection of operational editions was assigned to the Army Topographic Battalion. The project consisted of forty-two sheets, GSGS 4414.

Corps photomapping facilities produced numerous photomaps and large scale tactical maps.

A total of eighty-eight tons of maps was received during the month. Approximately eight tons were issued to Army units, eighteen tons to corps units, and the stock on hand at the end of the month was approximately 223 tons.

Recommendations were received from the army and corps topographic units for changes in existing tables of organization and equipment. These changes were submitted to higher headquarters, together with the recommendations of the Engineer Section. If approved, these changes would provide adequate facilities for map distribution and survey within the Army.

Terrain models, scale 1/50,000, of the papier-mache type were secured from the Office of the Chief Engineer, Communications Zone. Terrain models, scale 1/250,000 covering most of Germany were requested for staff planning by the G-2 Section of this headquarters. These models will be made by the Engineer Model-Making Detachment of the Office of the Chief Engineer, Communications Zone.

The Army Survey Center performed several survey missions, including radar sites. In addition, they supplied the III Corps Artillery with level data and rotated survey squads with the XII Corps engineer survey elements.

The reproduction program during the month consisted mainly of 1/25,000 and 1/50,000 scale maps. Seventy-five sheets of the 1/25,000 scale maps were reproduced for a total of approximately 1,041,000 copies. An additional thirty-four sheets were overprinted with additional colors. Ten sheets of the 1/50,000 scale 25th 4th series were reproduced in quantities averaging 7,500 copies each for a total of approximately 75,000 copies.

V - INTELLIGENCE

During the month information on the topography and rivers of the EIFEL Region was gathered and disseminated. Also, information on the OUR, SAUER, PRUM, KYLL and LIESER-BACH Rivers was sent to interested units.

Engineer Intelligence Notes No. 3 and Engineer Intelligence Bulletin No. 4 were produced and distributed to Army engineer units. In addition, 10,000 booklets on German mines and booby traps were sent to Army units.

The 2890th Engineer Technical Intelligence Team continued the policy of examining enemy engineer equipment, such as the 3 kg ball charge; the large Schu mine; adapter for the "S" mine igniter; demolition conversion kit; Italian friction igniter, and a new type electric igniter. Samples of each of these devices were sent to the Office of the Chief Engineer, Communications Zone. A new method of minefield laying by the Germans was also discovered and information on this method was disseminated to all units. The team also continued to give lectures and demonstrations on booby traps to units of the Army.

VI - WATER SUPPLY

During the month Army troops operated thirteen water points and six water distributing points. These water points produced approximately 3,560,000 gallons of water during this period. The 151ith and 1512th Engineer Water Supply Companies delivered water to prisoner of war enclosures and Army hospitals.

VII - CAMOUFLAGE

With the advent of warmer weather and the melting of snow, the painting of armored vehicles for snow terrain was discontinued. The deactivated carbide residue used on the vehicles was removed by the use of water and brushes.

The manufacture of snow suits was discontinued toward the end of the month, all fabric previously cut having been processed, and the suits delivered.

Camouflage of the radar unit of the 563rd Signal Aircraft Warning Battalion was re-converted to summer type, using drapes and nets.

Posters, designed to awaken interest in and to promote consciousness of the need of camouflage, were produced and distributed. Camouflage face paint in green and brown of a theatrical grease paint type was distributed to troops.

VIII - FIRE DEFENSE

Army units were attached to Quartermaster gas supply companies operating Class III installations to provide immediate protection. In addition, they assisted in setting up fire defense at Class V and railhead installations and hospitals, and were available on call to give assistance throughout the Army area.

Advance Section Communications Zone did not furnish any immediate protection for Army installations during the month. Fire protection for LUXEMBOURG (F-8413) and vicinity continued to be furnished by the LUXEMBOURG (F-8413) City Fire Department and the fire truck unit attached to the 1092d Utilities Detachment of this headquarters.

One trailer-pump unit pumped water from the OUR River over a 300-foot cliff to a regiment of the 76th Infantry Division for five days to relieve hand-carrying of water by the regiment.

IX - COMMENDATION

The following letter was received from the Army Commander and forwarded to all Third U.S. Army Engineers:

"HEADQUARTERS
THIRD UNITED STATES ARMY
Office of the Commanding General
APO 403

5 February 1945

SUBJECT: Commendation.

TO : The Army Engineer Officer, Third Army.

1. Please accept for yourself and pass on to the officers and men of your units the sincere appreciation and admiration of all the other elements of the Third Army for the work you have accomplished.

2. Over countless rivers and tank ditches in flooded Lorraine you constructed and maintained innumerable bridges. You cleared and reconditioned thousands of miles of road.

3. Your work in the recent operation in Belgium and Luxembourg has been equally outstanding and has been accomplished under still more intolerable conditions of weather and terrain.

4. Without the stimulus of combat, yet suffering losses from enemy fire, you have built the bridges lacking which the German penetration could not have been obliterated.

5. Each and every officer and man of the Third Army Engineer Units is hereby highly commended for the superior manner in which his tasks have been performed.

6. You will apprise all units concerned of the contents of this letter.

s/t/ G. S. PATTON, JR.,
Lieut. General, U.S. Army,
Commanding."

CHAPTER 10
MARCH OPERATIONS

I - OPERATIONS

The major disposition of engineer troops at the beginning of this period remained unchanged. The 1306th Engineer General Service Regiment remained in support of the VIII Corps, the 1303d Engineer General Service Regiment in support of the XII Corps, the 1301st Engr GS Regiment in support of the XX Corps and the 1134th Engineer Combat Group continued its mission of coordinating depot haulage activities and experimenting with special river crossing equipment.

In order to provide flexibility of Army support to the Corps the 1123d Engineer Combat Group, including the 145th, 183d, 188th and 249th Engineer Combat Battalions and the 770th Engineer Dump Truck Company, was detached from VIII Corps and placed in support thereof under Army control, effective 2 March. To provide equipment for this group, one platoon of the 609th Engineer Light Equipment Company was detached 1306th Engineer General Service Regiment and attached thereto.

On 2 March the 87th Engineer Heavy Ponton Battalion was detached from XX Corps and attached to 1134th Engineer Combat Group to be reloaded and held in Army reserve.

On 2 March the 285th Engineer Combat Battalion, which had been operating in an Infantry role in the XII Corps, reverted to Engineer control and remained attached XII Corps.

At 031800A March Engineer Operational Instruction No. 30 was published effecting the above noted transfers and assigning new areas of responsibility. By this time the push of the VIII Corps to the east was proceeding satisfactorily and the 1123d Engineer Combat Group was in support thereof and in turn supported by the 1306th Engineer General Service Regiment. The missions of the 1303d and 1301st Engineer General Service Regiments and the 1134th Engineer Combat Group remained unchanged.

Effective 3 March the 96lst Engineer Maintenance Company, less 1st maintenance platoon, was detached VIII Corps and attached XX Corps to provide maintenance facilities to that Corps.

Effective 4 March the 513th Engineer Light Ponton Company was detached VIII Corps and attached to XX Corps, which corps was pushing steadily to the east.

Effective 7 March, the 2d platoon of the 996th Engineer Treadway Bridge Company was detached VIII Corps and attached XII Corps to support its operation which was progressing rapidly to the east, north of the MOSELLE River.

The 2d platoon, 729th Engineer Depot Company arrived on 071200A March and was attached to 459th Engineer Depot Company.

Effective 9 March the light equipage platoon of the 509th Engineer Light Ponton Company from the 1134th Engineer Combat Group and the remainder of the 996th Engineer Treadway Bridge Company from VIII Corps were attached to XII Corps to support its planned assault of the MOSELLE River.

On 10 March the 658th Engineer Light Equipment Company arrived from the LE HAVRE (L-4828) area. This company was not employed operationally as it was attached to Seventh U.S. Army by Twelfth U.S. Army Group to be moved by 15 March. The unit moved out of Third U.S. Army area on 15 March.

On 10 March, Company A, 87th Engineer Heavy Ponton Battalion, and on 14 March the remainder of the battalion, were detached 1134th Engineer Combat Group and attached to XII Corps.

At 101800A March, Engineer Operational Instruction No. 31 was published effecting the above noted transfers and establishing new areas of responsibility. By this time the VIII Corps was being pinched out on the north and the XII Corps was moving rapidly to the east. In order to support the XII Corps operation the 1306th Engineer General Service Regiment was pulled out from behind the 1123d Engineer Combat Group and placed in support of the 1303d Engineer General Service Regiment to permit them to push up into the XII Corps area. The missions of the 1301st Engineer General Service Regiment and 1134th Engineer Combat Group remained unchanged.

On 10 March the 178th Engineer Combat Battalion was detached VIII Corps and attached XX Corps effective 11 March.

By 12 March the drive of the XII Corps had reached break-through proportions, and it accordingly was given the mission of turning south across the MOSELLE to out-flank the German forces in front of the XX Corps, south of the MOSELLE. Once again Third U.S. Army engineers faced the task of providing engineer means to force the MOSELLE River. At 180OA March 12 Engineer Operational Instruction No. 32 was published assigning new areas of responsibility and pushing the 1303d Engineer General Service Regiment well forward into the XII Corps area. Missions of all Army troops remained unchanged.

On 14 March the 1367th Engineer Dump Truck Company was detached VIII Corps and attached 1134th Engineer Combat Group to support its haulage activities.

Effective 16 March the 1st maintenance platoon of the 96lst Engineer Maintenance Company was detached VIII Corps and attached XX Corps to complete the transfer of this company.

On 16 March the 1258th Engineer Combat Battalion, which had been operating in an infantry role in XX Corps, reverted to Engineer control and remained attached to XX Corps.

At 161800A March Engineer Operational Instruction No. 33 (Annex No. 9) was published assigning new areas of responsibility. By this time XII Corps had successfully crossed the MOSELLE River and was pushing aggressively to the south just west of the RHINE River. Engineer missions remained unchanged.

The 1700th Engineer Combat Battalion arrived from the LE HAVRE (L4828) area on 17 March and was attached to the 1134th Engineer Combat Group to assist in the salvage of tactical bridging and its return to depot stock.

Effective 18 March the 88th Engineer Heavy Ponton Battalion, less Company B, was relieved from attachment to III Corps and attached to 1134th Engineer Combat Group in order to pick up tactical bridging in place and complete basic bridge load from depot stock.

On 18 March the 1010th Engineer Treadway Bridge Company arrived from the LE HAVRE (L-4828) area and was attached to the XX Corps to support its operations.

Effective 20 March, the 511th Engineer Light Ponton Company was detached VIII Corps and attached XII Corps.

By 20 March, the 88th Engineer Heavy Ponton Battalion had completed loading and it was detached 1134th Engineer Combat Group and attached to XII Corps effective that date to provide additional bridging over the MOSELLE.

Effective 20 March, the 770th Engineer Dump Truck Company was detached 1123d Engineer Combat Group and attached to 1134th Engineer Combat Group to provide increased depot haulage facilities to meet the moving situation.

By the night of 10 March the plans of the XII Corps for assault of the RHINE were being completed and the 1301st Engineer General Service Regiment was alerted to move up necessary materials and erection crews for one anti-personnel boom over the RHINE River. On 20 March the Regiment was instructed to move up the remaining anti-personnel and anti-barge materials which had been assembled at AESP No. 8 to provide a total of four each.

By 20 March, the drive of the XII Corps had again reached break-through proportions and the 1123d Engineer Combat Group including the 183d, 145th and 249th Engineer Combat Battalions was attached thereto to provide adequate engineer support. The 2d platoon of the 609th Engineer Light Equipment Company was relieved of attachment from the 1123d Engineer Combat Group and attached to the 1306th Engineer General Service Regiment effective the same date.

The plans of the XX Corps for assault of the RHINE River were also being completed and the 188th Engineer Combat Battalion was detached 1123d Engineer Combat Group and attached to XX Corps effective 20 March to provide additional engineer support.

The light equipage platoon of the 509th Engineer Light Ponton Company was detached XII Corps and attached XX Corps effective 21 March.

On 21 March the 1535th Engineer Dump Truck Company arrived from the LE HAVRE (L-4828) area and was attached to the 1134th Engineer Combat Group to support its haulage activities.

On 22 March the 264th Engineer Combat Battalion and the 1270th Engineer Combat Battalion arrived from the LE HAVRE (L-4828) area and were attached to the 1126th Engineer Combat Group, the advanced detachment of which had closed into the Army area 18 March with the main body of the 1126th Engineer Combat Group closing in on 26 March. The 1126th Engineer Combat Group was placed in support of the VIII Corps.

The 1154th Engineer Combat Group arrived from the LE HAVRE (L-4828) area on 22 March and was attached to the XX Corps effective that date.

At 221800A March, Engineer Operational Instruction No. 34 was published establishing new areas of responsibility and placing the 1126th Engineer Combat Group in support of VIII Corps. By this time the VIII Corps on the north had been given the mission of crossing the RHINE in the vicinity of BOPPARD (L-8981), the XII Corps had completed its plan for assault of the RHINE in the OPPENHEIM (M-4439) area and jumped off at 222200A March and the XX Corps had been pinched out on the south by shift of inter-group boundary. Consequently, the 178th and 188th Engineer Combat Battalions were detached effective 22 March from XX Corps and attached VIII Corps to support its RHINE operations. The 1010th Engineer Treadway Bridge Company was detached XX Corps and attached to 1134th Engineer Combat Group as Army reserve and to complete reloading from depot stock. On 24 March this company was attached VIII Corps.

On 23 March the 2727th and 2728th Engineer Light Equipment Companies arrived from the LE HAVRE (L-4828) area and were attached to the 1126th Engineer Combat Group and 1301st Engineer General Service Regiment respectively. Effective upon release by the 2728th Engineer Light Equipment Company, the 2d platoon of the 676th Engineer Light Equipment Company was detached 1301st Engineer General Service Regiment and attached 1303d Engineer General Service Regiment.

On 23 March the 1012th Engineer Treadway Bridge Company closed into the Army area from the LE HAVRE (L-4828) area and was attached to the VIII Corps to support its operations on the RHINE River.

Effective 24 March, the 2d platoon of the 997th Engineer Treadway Bridge Company was detached XX Corps and attached XII Corps to support its RHINE and MAIN River operations.

Effective 24 March, the 548th Engineer Light Ponton Company, less light equipage platoon, was detached XX Corps and attached VIII Corps to support its RHINE River operations.

Effective 24 March, the 87th Engineer Heavy Ponton Battalion was detached XII Corps and attached to the 1134th Engineer Combat Group for the purpose of hauling floating Bailey bridges from AESP No. 8 to the RHINE River.

Effective 24 March, the 287th Engineer Combat Battalion was attached to 1125th Engineer Combat Group, which group closed into the Army area from LE HAVRE (L-4828) on 25 March. The 287th Engineer Combat Battalion closed into the Army area on 26 March.

On 26 March the 181st Engineer Heavy Ponton Battalion arrived from First U.S. Army and was attached to the 1134th Engineer Combat Group for the purpose of hauling floating Bailey bridging from AESP No. 8.

On 26 March, the 1266th Engineer Combat Battalion arrived from the LE HAVRE (L-4828) area and was attached to the 1125th Engineer Combat Group, which had been given a task mission of picking up rear area tactical bridging no longer needed for operations and hauling it forward.

By 26 March the XX Corps was given the mission of crossing over the XII Corps and crossing the RHINE in the vicinity of MAINZ (M-3856). To support its operations the 997th Engineer Treadway Bridge Company was detached XII Corps and attached XX Corps effective 26 March.

By 26 March the XII Corps had successfully crossed the RHINE and was pushing rapidly to the north and east. To provide for construction of three floating Bailey bridges over the RHINE at MAINZ (M-3856), OPPENHEIM (M-4439), and BINGEN (M-1252), the 1123d Engineer Combat Group with the 145th, 183d and 249th Engineer Combat Battalions were detached XII Corps and reverted to Army control for this mission.

At 282400A March Engineer Operational Instruction No. 35 was published effecting the above noted transfers and assigning new areas of responsibility and missions as follows:

a. 1123d Engineer Combat Group: Construct Class 60 floating Bailey bridges at MAINZ (M-3856), OPPENHEIM (M-4439) and BINGEN (M-1252) and maintain all bridges upon completion over RHINE River in zone.

b. 1125th Engineer Combat Group: Perform all engineer work in zone and support 1126th Engineer Combat Group.

c. 1126th Engineer Combat Group: Perform all engineer work in zone and support VIII Corps.

Digitized by Google

d. 1134th Engineer Combat Group: Continue coordination of depot haulage activities and coordinate and control the delivery and operation of Naval LCVP's and LCM's in the RHINE River operations.

e. 1301st Engineer General Service Regiment: Perform all engineer work in zone, support XI Corps, construct all anti-personnel and anti-barge booms in RHINE River in Army zone and construct fixed bridge over RHINE River at OPPENHEIM (M-4439).

f. 1303d Engineer General Service Regiment: Perform all engineer work in zone, support XII Corps, continue assistance to Naval Unit M-2 and construct fixed bridge over RHINE River at MAINZ (M-3856).

g. 1306th Engineer General Service Regiment: Perform all engineer work in zone, construct barge bridge over RHINE River and be prepared to support 1303d Engineer General Service Regiment.

h. Separate Army Units: No change.

Effective 27 March the 178th Engineer Combat Battalion was detached VIII Corps and attached 1123d Engineer Combat Group.

On 29 March, the 1130th Engineer Combat Group closed into the Army area. This group headquarters was not employed operationally, as it was relieved of assignment to Third U.S. Army, 31 March, and assigned Fifteenth U.S. Army.

By 29 March, VIII Corps had successfully crossed the RHINE and the 1012th Engineer Treadway Bridge Company was detached therefrom and reverted to the 1134th Engineer Combat Group as Army reserve.

By 31 March the needs of the VIII and XII Corps permitted the re-grouping of the light pontoon companies. Accordingly, the 548th (-) Engineer Light Pontoon Com.any was detached VIII Corps and attached XI Corps, the light equipage platoon of the 547th was detached VIII Corps and reverted to Army reserve with its parent organization and the 511th was detached XII Corps and attached VIII Corps.

As of 31 March the disposition of engineer troops was as follows:

VIII CORPS	
1102d Engr C Gp	
1107th Engr C Gp

II - CONSTRUCTION

Bridges and Roads

During the month of March river crossing operations engaged in by Third U.S. Army exceeded those of any previous month and were believed to have equalled or exceeded those executed by any other Army in the history of warfare. In addition to the crossings of such streams as the SAAR and the MOSELLE, the RHINE itself--the mightiest of Europe's rivers--was crossed by assault for the first time in modern history.

The RHINE was crossed not only once but four times in a succession of assault crossings that completely overwhelmed and smashed the enemy.

As an anticlimax to these crossings, the MAIN River, a river comparable to the MOSELLE, was crossed in a series of operations which, had it not been for the fact that the RHINE overshadowed all others would have been looked upon as a major crossing operation.

The amount of bridging completed during the month was as follows:

TYPE OF BRIDGING	NUMBER	TOTAL LENGTH
Bailey bridge (fixed)	99	10,150
Bailey bridge (floating)	8	3,840
Heavy Pontoon bridge	6	3,170
Infantry Support bridge	3	200
M-2 Treadway bridge (floating)	25	11,574
M-2 Treadway bridge (fixed)	96	3,744
Fixed bridges	104	11,415
Total	341	44,073

Further means of crossing were provided by the use of rafts, Naval craft (LCVP's and LCM's) and amphibious tanks on a scale never before used.

The initial crossings during the month were those made over the PRUM and KYLL Rivers by VIII and XII Corps, respectively, and of the SAAR and MOSELLE by XI Corps.

The crossings of the PRUM and KYLL were hard-fought, bitter battles over relatively minor streams. Since, however, they were strongly defended and were tied in with the Siegfried defenses, the relative importance of the crossings was high. These rivers bisected the path to the RHINE and it was through the bridgeheads established over them that the armored drive to the RHINE passed. Once these bridgeheads were established, and the 4th Armored Division started rolling eastward, bridging in the area to the north and east of KYLLBURG (L-1761) became relatively unimportant, since most of the bridges and overpasses from there to the RHINE were captured intact. Southwest of KYLLBURG (L-1761) to the MOSELLE River, a number of smaller bridges and overpasses were destroyed over the SPITTZER and SAUR Rivers. However, since the advance proceeded at a slower tempo because of the fiere resistance encountered, these demolitions were not serious obstacles.

Simultaneously with the crossings of the PRUM and KYLL, the 10th Armored Division of XX Corps passed across the SAAR River over bridgeheads at SERRIG (L-1509), SAARBURG (L-1414), and ORTEN (L-1715) and so swiftly overran TRIER (L-2129) that a fine 1,100-foot existing highway bridge was captured intact. They then continued on along the north bank of the MOSELLE, where a crossing of the KYLL River was forced.

These operations concluded the first of four phases of the stream crossing operations of the month and found Third U.S. Army in complete control of the north bank of the MOSELLE River, as well as the area to the east and south of it as far east as the HUNSER River.

At this time the XII Corps turned to the south and in a beautifully executed river crossing operation smashed across the MOSELLE River between TRIER (L-6976) and MATZENPORT (L-7782). This crossing was executed by the 5th and 90th Infantry Divisions.

Treadway Bridge Under Construction Under Cover of Smoke at Matzenport on Moselle River

Initial crossings were made secretly at night in paddled assault boats and reinforcements were then poured over in storm boats, Infantry support rafts and treadway rafts. The commanding points of the terrain set up as targets for the Infantry to seize and to prevent enemy observation of the crossing sites were taken at an early hour in the first day, and by 1900 of the day the assault started, two Class 40 bridges had been constructed and ready for use, and still a third bridge was completed shortly thereafter. Through this bridgehead the 4th Armored Division again roared to the south, racing to BAD KREUZNACH (M-0934) on the NAHE River where, though the bridges had been destroyed, a crossing was made on a railroad bridge.

Bailey Bridge over Nahe River at Bad Kreuznach

In this dash, most bridges and overpasses on the way were captured intact and those that were destroyed were quickly spanned with either fixed treadway or Bailey bridges.

As the bridgehead over the MOSELLE was expanded to the west, still another crossing was made in the vicinity of BULLAY (L-5563), where a heavy pontoon bridge was constructed, and over which the 11th Armored Division stormed to run along the flank of the 4th Armored Division. Then the 4th Armored, after consolidating, started again and practically cleared the west bank of the RHINE as far south as WORMS (M-4515), with the exception of pockets at GERMERSHEIM (M-5438) and MAINZ (M-3856). Simultaneously with these pushes, XX Corps troops forced a way down the east bank of the SAAR and rolled up the Siegfried Line in this sector. To support these operations, floating bridges were constructed over the SAAR at MERZIG (L-9295) and METTLACH (L-1701). The bridging east of here to the RHINE did not present any further unusual difficulties, since the advances were so fast that bridges and overpasses were either captured intact, or, since the GLAN, SIMMER and NAHE streams were either narrow or fordable in these reaches, no real delay was produced.

DECLASSIFIED

DECLASSIFIED

Concurrently with this activity, VIII Corps executed still another assault crossing of the MOSELLE River, between HATZENPORT (L-7782) and KOBLENZ (L-9096). Here again the Infantry crossed in paddled assault boats and were reinforced by storm boats, powered assault boats and rafts. Treadway bridges were constructed at WINNINGEN (L-8491) and KOBERN (L-8090). The 87th Infantry Division crossed and quickly captured KOBLENZ (L-9096).

Treadway Bridge over Moselle River near Kobern

Floating Bailey Bridge over Moselle River near Kobern

This ended the second phase of the river crossings for the month and found Third U.S. Army holding the entire west bank of the RHINE from KOBLENZ (L-9096) to LUDWIGSHAFEN (R-5298). The crossing of the RHINE presented the next problem for the month, and there began for Third U.S. Army Engineers the task of the greatest technical and supply problems so far engaged in.

As early as August 1944, when it became apparent that the crossing of the RHINE might take place in the not too distant future, the Engineer Section established a special staff section to plan for the operation. By September preliminary estimates of equipment and materiel needed had been calculated and ordered, and a preliminary plan of action drawn up, based on the troops then available and the stretch of the river lying within the Army zone of advance. Later, when it was learned from conferences with higher headquarters that certain troops and equipment could be expected to be available, a plan of action providing crossings with FRANKFURT (M-6666) and DARMSTADT (M-6642) as the targets, was drawn up. Included in the plan was an analysis of all troop and equipment requirements which served as a guide for training specific troops to execute certain missions.

The crossings were to be made initially by XII and XX Corps, but XII Corps alone finally was committed to the task, and executed a crossing of such superior merit that it could well serve as a model for all future crossings. The plan called for a crossing in the vicinity of NIERSTEIN (M-4342) at a site selected many months before. Here a good network of roads intersected from the north, east, south and west, and a bridge with a floating center section and several ferry sites were located here.

The terrain was good from the XII Corps standpoint, since hills and a town masked approaches on the east side of the river, while a long, flat, open plain extended from the east bank several miles from the river, as can be seen from the photographs illustrating the crossing.

The plan for the crossing was that a single division would make the crossing and that all engineer work was to be executed by Corps Engineers or Army Engineers, depending generally upon previously planned tasks outlined in the Army plan.

Though the crossing was planned for 22 March, the SHAEF area was only cleared of the enemy on 20 March, at which time the critical supplies raced eastward through a hitherto forbidden area over roads that had to be cleared and streams that had to be bridged as they came. An attempt to run convoys up the north bank of the MOSELLE following the path of XII Corps would have been still slower and more difficult.

The staging of the operation by the XII Corps was handled by the 115th Engineer Combat Group, and in accordance with the Corps Engineer's plan, approximately 100 storm boats and motors, 300 assault boats and motors, life belts and other pertinent items were assembled by the corps in addition to the T/E equipment of approximately 500 boats and 100 motors. To back the operation with troops, one heavy pontoon battalion (minus one company) was initially attached to the Corps for use in refing operations; the remainder of the battalion and one other battalion having approximately 400 outboard motor operators, three treadway bridge companies, two light pontoon companies, plus light equipment platoon and seven battalions, were attached as well. Still another unit, one-half of Naval Unit No. 2, consisting of twelve LCVP's and their crews, were attached and pioneered the use of Naval craft in assault river crossing operations.

The historic crossing action started at 2200 with the 11th Infantry Regiment, supported by the 204th Engineer Combat Battalion, making a secret crossing in paddled assault boats. Wave after wave was crossed, with over 200 assault boats shuttling continuously throughout the night. By dawn a substantial part of all the Infantry in the 5th Infantry Division had crossed. At this time the LCVP's of the Naval unit had arrived and by 0730 twelve LCVP's were in the water and ferrying personnel, light vehicle and supplies, and evacuating wounded at such a rate that assault boats were no longer needed.

During the day a heavy ponton bridge was started by the 87th Engineer Heavy Ponton Battalion and by 240130 March, a 1280-foot Class 24 bridge was ready for traffic. By 0700 of the same date it had been reinforced to carry Class 40 loads.

Heavy Ponton Bridge Under Construction at Nierstein

Traffic Rolls Over Heavy Ponton Bridge at Nierstein

During the construction, a 150mm shell hit directly in the center of the bridge, but fortunately failed to explode. Aside from piercing the deck and a ponton and delaying the construction, it caused no important damage.

Through this bridgehead of the 5th Infantry Division, the 4th Armored Division raced off so swiftly to the east that HANAU (M-8571), thirty miles away, was reached in one day. To speed the traffic at still a faster rate, still another treadway bridge was ordered to be put in and work was started on 24 March and the bridge shown above was opened at noon on 25 March.

Treadway Bridge at Oppenheim

By 27 March five divisions had passed over these three bridges, as well as supplies and necessary supporting troops. The rate at which traffic crossed can be determined from the fact that the entire 6th Armored Division crossed in 16-3/4 hours. During the period from 24 March to 31 March, 60,000 vehicles crossed over these bridges at OPPENHEIM (M-4439).

Aside from the actual problem of building the bridges, the protection of them posed several problems which required special equipment and training, but this had been anticipated and fortunately the enemy was unable to halt the construction of or damage the bridges. The following security measures were employed:

a. Air protection. For the initial nine days of the operation, air cover was constantly maintained over the bridges.

b. Waterborne assault. Anti-personnel nets of the British Admiralty netting type were installed to aid in the capture of "Chasse" swimmers who, intelligence sources had indicated, might be attacking the bridges.

Subsequent to the original tactical crossings, plans had been made to replace the floating treadway bridges by floating Bailey bridges and by 29 March, six days after the initial bridging had begun, sufficient material was on hand to permit a floating Bailey bridge to be started. This was opened for traffic on 31 March.

Floating Bailey Bridge at Oppenheim

Simultaneously, equipment and material were being assembled by the 130lst Engineer General Service Regiment for the construction of a fixed bridge.

At the same time, in addition to the crossing of the XII Corps, plans were readied to support a crossing of the VIII Corps in the great gorge which runs from BINGEN (M-1252) to OBERLAHNSTEIN (L-9189). This stretch of the river presented difficult crossing problems and the problem of putting in a bridge caused some concern. Once ground reconnaissance had been made, however, the river did not seem so bad as studies had indicated.

The same base of supply as was used for XII Corps crossing operations was used here. The hundreds of boats and motors required had to make the long run over even more tortous terrain--the HUNSRUCK Mountains--to put the supplies in the corps depot. Also, twelve of the twenty-four LCVP's of the Army had been allocated to the corps for the operation. Since they had been routed to the vicinity of ALKEN (M-2726)

LCM's on the Road to Participate in Assault Crossings of the Rhine

in the expectation of crossings being made as originally planned, they now had to be routed over the hills to the north. Fortunately, the time factor was adequate to enable them to make this move and they were ready and in position by H-hour, due to the excellent work of the Naval Unit staff and that of the 1134th Engineer Combat Group.

The crossing plan of VIII Corps called for an assault crossing to be made in paddled assault boats by the 87th Infantry Division, with one crossing in the vicinity of NIEDER (L-9287) and other crossing at BOPPARD (L-8981). The crossing at BOPPARD (L-8981), however, was to be the main crossing site and the bridge was to be put in here. The initial wave crossed satisfactorily in each place, but strong enemy resistance was encountered at the north crossing site from enemy artillery and small arms and this was subsequently abandoned when it became apparent that the BOPPARD (L-8981) crossing was successful. Though six LCVP's had been allocated by the corps to take part in this operation, none were actually committed until about twelve hours after the assault started, since the advisability of using them at all was being carefully weighed, especially since if they had been knocked out on the way to site, the only approach road might have been blocked by them. Once in the water, however, they performed excellently as ferries and moved over great numbers of men, light vehicles and equipment, as well as evacuating the wounded. Once these were in the water, the need for the powered assault boats and storm boats which had been used up to this time was ended. It is estimated that 5,000 men and 400 vehicles were carried by the Navy alone.

Equipment Being Loaded Under Smoke Screen on LCVP's During Assault Crossing of Rhine River at Boppard

Infantry Assault Troops Board an LCVP at Boppard on the Rhine River

Infantry support rafts and M-2 treadway rafts had been also constructed earlier in the day and these were used to carry over light vehicles and tanks respectively.

An M-2 treadway bridge was started by 0800 on the morning the assault crossing was made, and by 0930 of the following day it was completed.

Digitized by Google

Treadway Bridge at Boppard in the Rhine Gorge

As previously mentioned, the technical difficulties produced by the stream made construction difficult, inasmuch as two standard power utility boats and two horse power outboard motors could scarcely handle the five ponton M-2 rafts. The LCVP's proved to be invaluable here in supplementing the power boats, as their powerful engines were able to breast the swift current.

While this operation was still underway, another crossing was started by VIII Corps on the night of 25-26 March at ST. GOAR (L-9873) and OBERWESEL (L-9967).

The pattern of the previous crossings was followed at ST. GOAR (L-9773) with paddled assault boats, making the initial crossings with powered assault boats carrying the succeeding waves.

Assault Troops Crossing Rhine River at St. Goar

This crossing was strongly resisted, however, and since only negligible resistance had been encountered at OBERWESEL (L-9967), the main crossing forces were shifted to OBERWESEL (L-9967), where they crossed and outflanked ST. GOAR (L-9873). When finally captured, it was found that ST. GOAR (L-9873) had been held by a relatively small force, but it was well equipped with automatic weapons that were well placed and skillfully concealed in the steep cliffs which line the stream.

At OBERWESEL (L-9967), the crossing was made with relatively light resistance, though sporadic artillery fire fell intermittently in the area. The initial crossings here, too, were made by paddled assault boats, followed by powered craft. Here, however, though the Naval craft were available, because of the difficult approach roads, they were not put into action until the afternoon. In the meantime, a fleet of ten DUKW's did a heroic job of transporting troops and supplies and in all made 236 crossings.

However, as soon as six LCVP's and six LCM's had been put into the water, the entire complexion of the picture changed, for they passed troops and equipment over the river at such a rate that within forty-eight hours nearly an entire division with all its vehicles and equipment had been carried over.

DUKW Transports Assault Troops over Rhine River at Oberwesel

This ferrying operation quickly supplied enough troops and armor so that ST. GOAR (L-9873) was cleared by the morning of 27 March and a treadway bridge was started on the same day and completed about thirty-six hours later.

Tanks Cross Treadway Bridge at St. Goar on the Rhine River

Armored Car Debarks from LCM at Mainz

This operation was slow, but the swift current and the poor anchorage made it a most difficult job. To assist in anchoring a bridge and as in construction as well, a one-inch steel aerial anchor line was emplaced and the bridge initially fastened to this. Subsequently, the anchorage was supplemented by heavy barge anchors.

The fourth crossing was executed by XX Corps at MAINZ (M-3856) in a difficult and strongly resisted operation. The initial waves of the 80th Infantry Division crossed secretly in paddled assault boats, while the succeeding waves crossed in double assault boats and storm boats powered with outboard motors. Flanking fire from 20mm flak weapons on the Island had been completely cleared. It was here that the Navy again demonstrated its ability to be most useful and effective in a crossing operation by providing a crossing means so swift and of such capacity that the enemy can be quickly overwhelmed. Soon after the Naval craft hit the water, they poured over a continual stream of troops, vehicles and tank destroyers in the early crucial hours that the enemy artillery was silenced and further ferrying and bridging was able to proceed without interference.

DECLASSIFIED

From the time the first craft went into operation at H plus 3½ until the treadway bridge was open at H plus 34, the Navy transported an estimated 7,000 troops and 600 vehicles. This was a magnificent performance, inasmuch as the river was about 2,000 feet wide at this point and the distance traversed from the loading point on the near shore to the unloading point on the far shore was nearly a mile. About fifteen minutes was required for a crossing cycle.

M-2 Treadway Bridge at Mainz - 1896 feet long; so far as known this was the longest tactical bridge ever built

Even after the completion of the bridge, the Naval craft were still used as ferries to carry empty vehicles and evacuate the injured, since the treadway bridge was used exclusively for one-way traffic heading toward the enemy.

The treadway bridge at MAINZ (M-3856) was a monumental structure, being 1,896 feet long and probably the longest tactical bridge ever constructed.

The crossing at MAINZ (M-3856) was coordinated with a simultaneous crossing of the MAIN River just east of the confluence of the MAIN and the RHINE at MAINZ (M-3856) by other elements of the division. The assault waves on the MAIN crossed in paddled assault boats with a build-up following in powered assault and storm boats and on Infantry support and M-2 treadway rafts which were able to be constructed at an early hour, since the enemy was quickly overwhelmed by the crossing forces. This crossing was not so strongly opposed as that at MAINZ (M-3856) and an M-2 treadway bridge was started at 0700 of the day the assault started and was completed by 1900 that evening. It was 624 feet long.

M-2 Treadway Bridge at Hochheim

This ended the assault phase of the Rhine operations. At this time, Third U.S. Army held the entire west bank of the RHINE River and the east bank as well from OPPENHEIM (M-4439) to KOBLENZ (L-9096) with the exception of a pocket on the east side which, though little enemy activity had been noted, had not been physically cleared.

The following items were pertinent to all the crossings:

a. The same pattern of executing the crossing and providing defensive measures described for the XII Corps crossing was, in general, followed at the other sites with minor modifications, as determined by the individual characteristics of the site.

b. All crossings were made secretly without artillery preparation.

c. Outboard motor boats attracted enemy fire whenever used.

d. When LCVP's and LCM's are available, the quantity of troops and equipment that can be ferried in them is so great that very close coordination must be established between them and traffic control authorities in charge of the crossing, since much valuable transport time may be lost waiting for loads.

e. The standard power utility boats were not powerful enough efficiently to serve as general work boats in a stream as swift as the RHINE, though two of them, aided by two outboard motors, can readily navigate a five-ponton raft with M-2 pneumatic or heavy ponton. Because of their lack of power and to supplement the number which was available, both LCVP's and LCM's were used to aid in the construction of the bridges.

Immediately following the assault phase, construction of the floating Bailey bridges to release the tactical bridging for use farther forward was begun. As previously noted, a floating Bailey bridge had been constructed at OPPENHEIM (M-4439) by 31 March and at the same time the general service regiment scheduled to construct a permanent type fixed bridge at OPPENHEIM (M-4439) started work at the site, even though the assault crossing had been made only seven days previous and the companies employed had to complete projects on the SAAR River--some eighty miles to the rear--on which they had been unable to start until 19 March, when the breakthrough was made.

Similarly at MAINZ (M-3856) a floating Bailey bridge was started on 29 March, the day after the assault crossing. This bridge was completed, but because of the extremely swift current--6.6 feet per second flowing at the site--its capacity was initially limited to Class 35, until extra pontons could be placed in each bay in the swift water sections and false bows provided for all the boats. This swift water was not the normal rate of flow at MAINZ (M-3856), but it was caused when the three center spans of road bridge were dropped into the stream, causing a partial damming. This caused the water gap to be restricted and consequently the water about 100 yards from each shore about one-half mile downstream of the wrecked bridge flowed at a substantially faster rate than usual. However, because of the road network, this particular stretch was the most suitable for traffic flow and therefore both floating bridges were constructed at this point. Once additional anchorages had been provided, the bridges offered no unusual problems of maintenance other than could be expected on bridges of such length.

Floating Bailey Bridge on Rhine River at Mainz

On 30 March the 130lst Engineer General Service Regiment began the construction of a 1,050 foot steel stringer pile bent bridge at OPPENHEIM (M-4439). On 29 March, the day following the assault crossing, the 1303rd Engineer General Service Regiment began construction of a timber bridge on the site of the destroyed bridge, with the wreckage of the former bridge being utilized, where practicable, as a foundation for the bridge. This site was selected primarily because it was felt that a bridge could be built here in about one-third of the time that would be required to construct an entirely new bridge, particularly since the length of an entirely new bridge would be close to 2,000 feet, whereas the gap in the damaged bridge was only 1,050 feet. Time was the deciding factor in this decision, since at any time after 1 May the start of the summer high water could be expected, and it was decided that a permanent structure should be finished by this date, since the usual accumulation of debris accompanying the flood would probably make it impossible to maintain floating bridges.

Partially Destroyed Highway Bridge at Mainz

As a further safety factor, the LCM's and LCVP's that had been used in the assault operation were still held on the river for emergency use. They still proved to be invaluable in assisting in the building and maintenance of bridges and the nets and booms, and present plans contemplate keeping them as emergency craft for ferrying if needed.

In addition to the bridges described above, another floating Bailey bridge was constructed at BINGEN (M-1252) and still another one was begun at LORCH (M-0561) to be used as a corps tactical bridge, but construction was subsequently halted when the advance of the forces progressed so far beyond the river that it lost its original importance.

Bailey Bridge over Rhine River at Bingen

Floating Bailey Bridge under Construction at Lorch

As noted previously, XII Corps plunged on across the RHINE at such a rate that its armor in the space of a few days had smashed across the MAIN River at HANAU (M-8771) and near FRANKFURT (M-6660) and at both places floating treadway bridges were constructed to aid the advance.

Timber Trestle Bridge under Construction across Rhine River at Wesel

During the first half of this period, the 1306th Engineer General Service Regiment was still engaged in the maintenance, repair and reconstruction of main supply routes in the AHLEN (P-6123)-BASTORNE (P-9657) area. These roads were those damaged because of the sudden thaw in the early part of February. This regiment utilized 750 prisoners of war and 350 civilians in this work. Road base materials of crushed slag were brought in by rail from MOHANDE (P-6306) mill and steel mill at LUNEN (P-5805).

Other road work included removing log obstacles at entrances to villages, filling over trench tank obstacles, and repairing craters, in addition to usual road maintenance and repairs.

III - SUPPLY

The rapid movement of the Army to the RHINE River and the tactical crossing of that river by three corps required the movement of enormous quantities of tactical and fixed bridging materials from assembly areas in Engineer Depot Nos. 8, 13 and 14 to forward depots supplying the corps and, at times, directly to bridge sites. At the final crossing of the RHINE, the supply line for engineer materials extended approximately 143 miles. The majority of equipment required was on hand in Army depots, but the principal problem was that of moving material forward at a rapid rate and at the same time displacing depots forward in time to receive these supplies. A total of 4,926 tons of engineer bridging, excluding fixed timber bridge material, was moved to forward areas by Army truck over the period from 22 March to 31 March. The tonnage was composed of floating Bailey bridge, fixed Bailey bridge, treadway bridge, and light floating equipage.

With the exception of truck-mounted cranes, the supply of heavy equipment was sufficient to satisfy demands. Four of these cranes were received from Advance Section Communications Zone on a loan basis for use during the RHINE crossing operation when rapid loading and unloading of bridging material were of prime importance.

Adequate stocks of tactical bridging were on hand in Army depots or en route from Communications Zone depots to support the RHINE operation. I-beams and lumber also were available in sufficient quantities.

The demand for crushed rock and equipment for repairing roads diminished during the month to practically zero due to a combination of better weather and the fact that the tactical situation moved out of the general area of bad roads in LUXEMBURG (P-8411) to the more stable German roads. Production of crushed rocks from civilian sources was completely suspended.

Depot stocks of Class II items improved generally, but a definite shortage continued on specific small tools, such as hammers, hatchets and files.

The footage of fixed bridging material consumed during the month was approximately double that used for the previous month. A total of 3,030 tons of steel consisting of 14" and 20" steel I-beams was used. The majority of steel was acquired from local steel mills operated by Advance Section Communications Zone.

Steel Yard at Engineer Depot No. 13 at Asch

Listed below is pertinent information on Army depots in operation during the month:

Depot No.	Type	Average Tonnage
8	Rhine River Bridging	6,000
10	Class IV and Bridging	800
13	Class IV and Bridging	8,000
14	Class II and IV	3,200
16	Class IV & Bridging	400
17	Class IV and Bridging	400
18	Class IV and Bridging	200
19	Class IV and Bridging	400
20	Class IV and Bridging	600
21	Class IV and Bridging	675
22	Class IV and Bridging	150
23	Class IV and Bridging	600
24	Class IV and Bridging	400
25	Class V and Bridging	300
26	Class V and Bridging	400

Engineer Depot No. 13 at Asch

An acute shortage of cranes and depot personnel was experienced because of the large number of depots operated by the Army. A total of eighteen motorized and crawler cranes were used. These were augmented by a large overhead crane at Engineer Depot No. 13, which was used to handle steel I-beams, timbers and piling. One additional Engineer depot platoon was attached to the Army during the month. This unit was used to load out RHINE bridging at Engineer Depot No. 8.

All engineer supplies were delivered to Army Engineer Depots No. 13 and 14 from Advance Section Communications Zone and Communications Zone Depots by rail. Forward movement of practically all supplies from these two depots to Advance Engineer Depots supporting the corps was performed by the 113th Engineer Combat Group, using the transportation of the following units:

87th Engineer Heavy Ponton Battalion
181st Engineer Heavy Ponton Battalion
553d Engineer Heavy Ponton Battalion
1700th Engineer Combat Battalion
509th Engineer Light Pontoon Company
770th Engineer Dump Truck Company
793d Engineer Combat Battalion (Less one company)
13564th Engineer Dump Truck Company
13567th Engineer Dump Truck Company
13574th Engineer Dump Truck Company
3459th Quartermaster Truck Company
3799th Quartermaster Truck Company
3988th Quartermaster Truck Company
4051st Quartermaster Truck Company
651st Quartermaster Truck Company

A total of 7,900 tons of engineer supplies was hauled by the above units during the month.

Engineer maintenance of heavy equipment continued at a high rate. However, a large amount of equipment requiring the 4th echelon maintenance and above was evacuated to the Advance Section Communications Zone base shop, thus relieving Army engineer maintenance companies of higher echelon maintenance.

A special maintenance crew operated in the bridge field at Engineer Depot No. 13 for the purpose of repairing light floating equipage. The repair work done by this crew contributed immensely in providing materials for river crossing operations. A summary of equipment repaired during the month is as follows:

Floats, pneumatic	374
Boats, reconnaissance	53
Boats, storm	41
Boats, assault, M-2	283
Boats, power, utility	10

Repairing Power Utility Boat

IV - MAPS

No new mapping was undertaken during the month. All mapping consisted primarily of revision, color separation, and checking existing 1/25,000 scale maps against available photography for discrepancies which would make the maps operationally dangerous.

Five sheets of the G2G3 4414, 1/25,000 scale maps were revised during the month. This revision consisted of various sheets throughout the Army area which were found to contain errors of sufficient magnitude to necessitate the action.

Color separation work on the 1/25,000 scale, G2G3 4414 series maps was continued in the Army area. However, because of the nature of the tactical operations, multi-colored maps were not printed beyond the bridgehead operations east of the RHINE River.

A compilation of a gazeteer from the 1/100,000 scale maps was assigned to the 652nd Engineer Topographic Battalion, but progress on this project was negligible because of other operational commitments of a more urgent nature.

The color separation of three sheets of the new 1/200,000 scale

Digitized by Google

road maps of Germany was undertaken and completed. Specifications were outlined by the Office of the Chief Engineer, Communications Zone. This project was given top priority, in order that the maps might be completed in time to be of use to field units.

Eighty sheets, OSGS 4414 series, 1/25,000 scale maps were checked against available aerial photographs to determine their operational efficiency prior to reproduction. The photography was of such a small scale that only major topographic features could be accurately checked. No serious errors were noted.

The photomapping facilities of the Corps Topographic Companies were not utilized by the Army. Special maps and map substitutes and supplements were prepared under the direction of the Corps Engineers.

The Army Survey Center was assigned the mission of supplementing existing trig in the area north and east of BITBURG (L-1353). However, this area was immediately left in the rear by the rapid advance of Third U.S. Army and the project cancelled before completion. Enough control was established to substantially strengthen the trig in this area before the project was terminated.

During the month the Army Survey Center established geodetic control for five radar stations. One of these missions consisted of accurate location of targets on a bombing range for the XII Tactical Control Group (Provisional).

Five survey technical targets were investigated. Only one of these, a captured German map depot at MAINZ (M-3954), Germany, yielded any data of importance.

A field check of sheet 6402, OSGS 4414 series, scale 1/25,000 map was undertaken. Results of this field check have not been compiled.

A survey party from the Army Survey Center, assigned the mission of furnishing astronomical azimuth for the XII Corps artillery, was maintained during the entire month.

A total of eighty-eight tons (approximately 2,047,000 sheets) of maps were received during the month. Over four tons (approximately 95,296 sheets) were issued to Army units and ninety-three tons (approximately 2,118,044 sheets) issued to corps units.

During the middle of the month, when Third U.S. Army was making rapid advances, corps and divisions changed areas of operations on short notice. Units had to be mapped well in advance of their immediate objectives with wide areas of coverage. The result was a daily consumption of maps greater than for any other operation since Third U.S. Army became operational.

The rapid advance of adjacent armies made liaison with adjoining Armies' Topographic Sections a matter requiring careful coordination in the exchange of bodilines, color pulls and printed stocks. In order to satisfy the enormous consumption of maps used during the month, it was necessary to utilize to the utmost all available reproduction facilities. Corps topographic companies used approximately 50% of their reproduction facilities to augment that of the Army Topographic Battalion in the reproduction of operational maps.

An additional phase in the reproduction program consisted in the initial printing of Third U.S. Army After Action Report. Since operational demands upon Army reproduction facilities did not permit full scale diversion to this report, it was necessary to farm out a portion of the work to two outside units.

V - INTELLIGENCE

During the month the rapid and ever-changing tactical front necessitated a more extensive coverage of intelligence data with respect to the topography, roads and rivers of Germany. With the completion of a study of the area in the vicinity of ST. GOAR (L-9873), data on the RHINE River was procured, prepared and distributed during a preceding month. However, a special assault crossing study was prepared and given to the Corps Engineer concerned.

A road and bridge study covering the general area from BONN (P-5537) on the north, to WEINHEIM (G-5983) on the south, to MERSCHEID (S-4801) on the east, and to FULDA (R-3718) on the north, was prepared and distributed to corps, divisions and Army units. Additional publications such as the ISTD "Topography, Road and Bridge Studies" to cover the area from the German border east to WURZBURG (R-5935) and north to KASSEL (C-2207); "Terrain Appreciation Central Germany - Part A and B; "Terrain Diagrams of West Central Germany" and "Detailed Description of Crossing over the MAIN River" were issued to all interested units.

Such miscellaneous studies as the "Railways of Germany and Commerce in Germany," were also distributed.

During the month Engineer Intelligence Notes No. 3 and Engineer Intelligence Bulletins No. 5 and No. 6 were produced and issued to corps, divisions and engineer units.

New engineer units coming in the Army area were given all available data and also booklets and posters on enemy mines and booby traps.

The 2890th Engineer Technical Intelligence Team continued to devote its time to the gathering of information on enemy engineer equipment of all types and the dissemination of such information as was deemed necessary to the engineer troops in Third U.S. Army. Also new items of interest which were desired by the Engineer Board at Fort Belvoir, Virginia, were located and subsequently forwarded to the Office of the Chief Engineer, Communications Zone, for shipment to the United States. Among these items were new type treadway pontons, new large type Schu mines, wooden anti-tank mines, German pontons and a small German water pump. To keep up with the tactical situation, the unit moved to a forward command post in the city of TRIER (L-2129, Germany. From this point the unit broke up into small parties of three men each to explore installations and enemy dumps in and around that city. No new items of enemy engineer equipment were found; however, some quantities of equipment which were in short supply for training purposes were located and sent to the rear areas. Among these were Topfmine igniters, Riegel mines, Schu mines and light panzer mines.

VI - WATER SUPPLY

During the month Army troops operated thirty-one water points and four water distributing points, in addition to corps and divisional water points. These water points produced approximately 4,218,000 gallons of water during this period. Seven mobile units and eighteen portable units were used for producing water. Twenty-eight 700-gallon tankers and four 1,900 gallon trailers were used for hauling water to installations and six 1,900 gallon trailers were used for storage at installations. The ever-increasing number of prisoners of war and displaced persons greatly increased the amount of water hauled. Action was taken in getting municipal water systems to operate in sections of cities in which Army installations were located. This not only provided sufficient water for sanitary purposes but also reduced the amount of water to be hauled.

VII - CAMOUFLAGE

During the month the second in a series of camouflage posters, designed to awaken an interest in, and consciousness of, the need for camouflage, was distributed.

The first platoon inspected the bridge crossing over the RHINE at MAINZ (M-3854) during the early period of operation. Smoke screens were effectively used to conceal the bridge and concentration of approaching traffic. Additional operations of this platoon included the discovery in ALSFELD (R-0840), Germany of approximately 7,900 rolls of German camouflage grass-garnished chicken wire, colored in dark green and brown. The rolls were approximately three feet wide and thirty feet long, and are not considered useful, as the material is of the type that is normally used to conceal permanent installations and there is a sufficient supply of American materials on hand. The platoon further assisted units of XX Corps in inspection and assistance in camouflage problems.

VIII - FIRE DEFENSE

Army units remained attached to Quartermaster gas supply companies operating Class II installations to provide immediate protection. In addition, they assisted in setting up fire defense at Class V and railhead installations and hospitals, and were available on call to give assistance throughout the Army area.

Advance Section Communications Zone did not furnish any immediate protection for Army installations during the month.

Fire protection for LUXEMBOURG (P-8413) and vicinity continued to be furnished by the Luxembourg City Fire Department and the fire truck unit attached to the 1092d Utilities Detachment of this headquarters. The latter unit furnished protection for Third U.S. Army forward command post, while the 1240th Fire Fighting Platoon's fire truck unit located at gasoline supply point No. 9, in TRIER (L-2129) furnished protection for the rear command post in TRIER (L-2129) during the latter part of the month. No major fires occurred during the month.

CHAPTER 11
APRIL OPERATIONS

I - OPERATIONS

At the beginning of this period, the VIII Corps was supported by the 1126th Engineer Combat Group, which unit was, in turn, supported by the 1125th Engineer Combat Group; the 1301st Engineer General Service Regiment was in support of XI Corps; the 1303d Engineer General Service Regiment was in support of XII Corps, and the 1134th Engineer Combat Group continued coordinating hauling activities and delivery and operation of Naval LCVP's and LCM's in the RHINE River operations.

Agreement was made with Advance Section Communications Zone for their troops to take over designated routes of communications west of the line MAYEN (L-6392)-SINZIG (L-8555)-OBERSTEIN (L-7123) effective 3 April. Engineer Operational Instruction No. 36 was published on 1 April establishing new areas of responsibility to be effective 3 April and placing the 1125th Engineer Combat Group in support of the 1301st Engineer General Service Regiment and the 1306th Engineer General Service Regiment in support of the 1303d Engineer General Service Regiment.

On 3 April the 668th Engineer Light Equipment Company reverted to Third U.S. Army from Seventh U.S. Army and was attached to the 1125th Engineer Combat Group. Effective the same date the 1298th Engineer Combat Battalion was detached from XX Corps and attached to the 1125th Engineer Combat Group and the 1252d Engineer Combat Battalion was detached from VIII Corps and attached to the 1126th Engineer Combat Group.

Effective 4 April the 995th and 1010th Engineer Treadway Bridge Companies were interchanged between the VIII and XII Corps. Naval Unit N-2 was detached from the 1134th Engineer Combat Group and was attached to the 1123d Engineer Combat Group. Engineer Operational Instruction No. 37 was published on the same date.

On 7 April the 1012th Engineer Treadway Bridge Company was detached from the 1134th Engineer Combat Group and was attached to the 1123d Engineer Combat Group to support its mission of maintenance of the RHINE River bridges. The 509th Engineer Light Pontoon Company was detached from the 1134th Engineer Combat Group and attached to the XX Corps.

Effective 9 April the 995th Engineer Treadway Bridge Company and the 997th Engineer Treadway Bridge Company were interchanged between the VIII and XX Corps. Engineer Operational Instruction No. 38 was published on 9 April. The 1125th Engineer Combat Group was placed behind XX Corps, relieving the 1126th Engineer Combat Group of the dual mission of supporting both XX and VIII Corps and the 1306th Engineer General Service Regiment was placed in support of the 1126th Engineer Combat Group.

On 14 April the 183d Engineer Combat Battalion was detached from the 1123d Engineer Combat Group and attached to the 1126th Engineer Combat Group in support of the VIII Corps. On 16 April the 1349th Engineer Dump Truck Company and the 995st Engineer Treadway Bridge Company were detached from VIII Corps and attached to the 1134th Engineer Combat Group to assist in hauling.

On 17 April Third U.S. Army was assigned a new zone of action, necessitating regrouping of troops. The VIII Corps and supporting troops reverted to First U.S. Army effective 22 April and took over the area of the XX Corps. The XX Corps was crossed over both VIII and XII Corps and turned south, and the III Corps and supporting troops reverted from First U.S. Army to Third U.S. Army and placed on the right flank. Engineer troops supporting VIII Corps, consisting of the 1102d and 1107th Engineer Combat Groups, the 35th, 44th, 159th, 166th, 188th and 243d Engineer Combat Battalions, the 511th and 527th Engineer Light Pontoon Companies, the 628th Engineer Light Equipment Company, the 997th Engineer Treadway Bridge Company, the 666th Engineer Topographic Company and the 2893rd Engineer Technical Intelligence Team (Combat) reverted to First U.S. Army and Engineer troops supporting III Corps, consisting of the 1111th and 1159th Engineer Combat Groups, 91st, 284th, 291st, 299th, 300th and 1262d Engineer Combat Battalions, 72d and 540th Engineer Light Pontoon Companies, 629th Engineer Light Equipment Company, 998th Engineer Treadway Bridge Company, 672d Engineer Topographic Company and 2942d Engineer Technical Intelligence Team (Combat) reverted from First U.S. Army to Third U.S. Army. The 249th Engineer Combat Battalion was detached from the 1123d Engineer Combat Group and assigned the mission of maintaining the RHINE River bridges and removing tactical RHINE River bridges. Engineer Operational Instruction No. 39 was published on 17 April effecting the transfers referred to above.

On 19 April Naval Unit N-2 was detached from the 1123d Engineer

Digitized by Google

Combat Group and attached to the 249th Engineer Combat Battalion.

Effective 20 April the 1126th Engineer Combat Group was interchanged with the 1152d Engineer Combat Group. Also, the 525th Engineer Light Pontoon Company arrived from the port of LE HAVRE (L-4827) and was attached to the 1134th Engineer Combat Group. Effective 23 April the 528th Engineer Light Pontoon Company was detached from the 1134th Engineer Combat Group and attached to III Corps, and the 546th Engineer Light Pontoon Company was detached-III Corps and attached the 1134th Engineer Combat Group. On 21 April the 991st Engineer Treadway Bridge Company was detached from the 1134th Engineer Combat Group and attached to III Corps to support its operations. On 22 April the 974th Engineer Maintenance Company was detached from VIII Corps and attached III Corps.

Effective 24 April the 678th Engineer Light Equipment Company reported from Ninth U.S. Army and was attached to the 1123d Engineer Combat Group.

On 25 April the 1482d Engineer Maintenance Company arrived from the port of LE HAVRE (L-4827) and attached to the 113kth Engineer Combat Group. On 25 April Engineer Operational Instruction No. 40 was published establishing new areas of responsibility.

On 29 April the 183d Engineer Combat Battalion was detached from the 1123d Engineer Combat Group and transferred to Fifteenth U.S. Army. On 29 April Engineer Operational Instruction No. 41 was published.

Disposition of Engineer units on 30 April was as indicated below:

Effective 23 April, the 551st Engineer Heavy Pontoon Battalion closed into the Third U.S. Army area from Ninth U.S. Army and was attached to 1134th Engineer Combat Group.

II - CONSTRUCTION

Bridges and Roads

During April the bridging constructed by Third U.S. Army averaged nearly 1,900 feet per day, as is shown in the following table:

Type	Number	Length
Fixed Bailey Bridges	132	13,090
Floating Bailey Bridges	3	5,548
Heavy Pontoon Bridges	3	430
Infantry Support Bridges	4	640
Fixed Treadway Bridges	83	4,620
Floating Treadway Bridges	23	6,624
Timber Trestle Bridges	146	13,706
Total	394	44,670
Daily average	13	1,489

Initially, the greater part of the bridging consisted in completing two fixed bridges across the RHINE and in providing passages over or around the numerous damaged overpasses and underpasses on the FRANKFURT (M-6860)-DARMSTADT (F-2090) Autobahn, since for the first half of the month this road was literally the backbone of the Army.

Most of the obstructions were individually inconsequential. They could either be by-passed or could quickly be spanned with a Bailey bridge. A few small floating bridges were required on the FULDA, WERRA, SAALE and ELSTER Rivers. But aside from a costly fire fight on the WERRA River, the crossings were accomplished rather easily and with dispatch. A contributory factor was that all of the streams were low at that time and nearly all were fordable. In the following photographs are shown representative bridges constructed during this period:

Four Views of Fixed Bridge Taken during Construction on Site of Demolished Highway Bridge at MAINZ (M-3856). This Bridge was Completed in Twenty Days.

Two Aerial Views of the Fixed Bridge across the Rhine River at OPPENHEIM (M-4A39). This bridge was completed in Twelve Days.

Treadway Bridge over Danube River at Regensburg

Bailey Bridge over Danube River at Regensburg

In addition to the major crossings mentioned above, crossings of the NAAB and ALTMÜHL Rivers were also major operations. Since, however, the crossings were only lightly opposed, the construction of bridges involved no real problem.

The policy of replacing treadway bridges with Bailey bridges and Bailey bridges with permanent bridges was again followed. The Engineers were sorely pressed at times to provide permanent structures to replace the tactical bridges as quickly as needed. The change of direction of the Army, the large requirements for Assault Equipment in crossing the DANUBE River, and the very long distances involved between the main Army supply depots and the forward dumps made supply a difficult problem. Nevertheless, and in spite of the fact that bridging rolled some 200 miles from the dump to the construction site, it was always on time.

In addition to the previously described two fixed bridges and tactical bridges constructed across the NAAB River by units under Army control, sixty-one fixed timber bridges were constructed totaling 7,000 feet.

On the Autobahn highway east of BAYREUTH (G-7797) a two-way timber bridge, 120 feet long, was constructed, using Bailey bridge panels as steel truss stringers because of the shortage of steel I-beams for stringers. A special report has been prepared covering this unusual project, as illustrated by the pictures below.

With improved weather conditions and the rapidly moving tactical situation, road maintenance became an item of secondary importance during this period. The roads in the FRANKFURT (B-6666)-JENA (J-7066) area were generally in very good condition. The autobahn highway paralleling the army axis consisted of two twenty-eight foot concrete lanes, by-passing all towns and villages. The few major bridges that were destroyed on this highway were by-passed by constructing detours. This arterial highway carried over eighty percent of the army traffic.

IV - MAPS

The photomapping facilities of the Army Topographic Battalion were engaged in miscellaneous revision and color separation work. Gazeteers compiled on the 1/100,000 scale G5738 4416 series covering Sheets M-3, P-3, Q-3, R-3, P-4, Q-4 and R-4 were completed.

The remaining forty-five sheets of the 1/25,000 scale topographic maps in the color separation project were completed. This separation included the forestry and drainage.

Emergency road maps were prepared from captured German road maps at a scale of 1/300,000. Roads were numbered and marginal information changed to conform with existing policies in utilizing these maps. This project consisted of six sheets.

The Army Survey Center investigated approximately twenty reported survey targets. Assistance was furnished to the Houghteam in exploiting the targets which contained trig and map data. A system of cooperation was worked out between the Army Survey Center, the CSS Survey Target Team and the Houghteam, so that duplication of effort was eliminated.

Some valuable photomapping instruments were discovered and exploited. One officer from this unit spent four days getting this equipment ready for shipment to the United States.

Consumption of maps continued at a high rate. Army reproduction facilities were augmented by the Corps Topographic Companies who used approximately 50% of their facilities. Reproduction was further augmented by the Topographic Battalion assigned to Fifteenth U.S. Army, which unit ran nine 1/50,000 scale maps, for a total of 62,000 copies.

Approximately 300 different sheets of the 1/25,000 scale maps were reproduced for a total of 1,553,000 copies. Nine sheets of the emergency road map were reproduced for a total of 304,000 copies. Seventy-eight sheets of the 1/50,000 scale maps were run for a total of approximately 947,000 copies.

Total maps received during the month were 4,815,275; issued to Army units, 210,995; to corps units, 2,219,525; stock in depot at end of month, 2,838,400 sheets.

On 5 April a new program was outlined for the reproduction of the 1/50,000 Bavarian series for pending operations to the southeast. During the month, map depots were moved as follows:

Third U.S. Army Map Depot from MAINZ (M-3856) to GOTHA (J-1865) on 18 April and from GOTHA (J-1865) to BAMBERG (O-2549) on 22-24 April.

Communications Zone Advance Map Depot from TRIER (L-2129) to MAINZ (M-3856) on 5 April.

Arrangements were made on 19 April with Sixth U.S. Army Group for transferring to Third U.S. Army large stocks of 1/50,000 and 1/100,000 maps covering the eastern half of Bavaria.

V - INTELLIGENCE

A change in the tactical advance of Third U.S. Army necessitated a complete re-issue of Engineer Intelligence data to Corps Engineers and to Army Engineer units.

Information on the terrain and topography in the Army area of advance was furnished by the distribution of studies such as the "Terrain Appreciation of Southeastern Germany," covering an area bounded on the west by a line PASSAU (M-6292)-STRAUBING (N-7113); on the north by a line FREYUNG (M-6232)-AMBERG (N-2201); on the east the Czechoslovakian and Austrian border; and on the south the frontier between Austrian Tirol Mountains and the Bavarian Alps; "Topography of Austria," and a terrain map of Western Czechoslovakia and Austria.

Information on crossing sites and bridges on the FULDA, SAALE, FRANKISCHE REZAT, SCHWABISCHE REZAT, REGNITZ, PEGNITZ, DANUBE, ISAR and INN Rivers was furnished to all interested units. Also information on the rivers in Western Czechoslovakia and rivers and bridges in Austria was supplied to Corps Engineers.

In addition to the above-mentioned studies, a combined road and river study, "Southeastern Germany," was prepared and given a wide distribution throughout the Army.

Such miscellaneous studies as the "Topography of the Redoubt Area," and "Rapid Airfield Construction in Western Czechoslovakia and Austria," were also distributed.

During the month Engineer Intelligence Notes No. 4 and Engineer Intelligence Bulletin No. 7 were produced and issued to corps, divisions and engineer units.

The 283Oth Engineer Technical Intelligence Team continued its normal operational activities of reporting on new types of enemy engineer equipment encountered during the period, and the examination of pertinent enemy installations, including dumps, assembly plants, factories, etc.

Two new items of great interest were picked up by corps teams and forwarded to the team for research and dissemination, one being the new Topfmine "S" and the other a completely new type of delay igniter. This igniter is a five-minute delay igniter which can be set to detonate from one to five minutes after the pin has been removed.

Numerous factories were investigated and reports were subsequently made to the Chief Engineer, European Theater of Operations. This unit also attempted to keep all headquarters informed as to the location of usable engineer supplies. Many large quantities were encountered and reported.

VI - WATER SUPPLY

Potable water was delivered to camps and enclosures containing many thousands of Allied prisoners of war, displaced persons and enemy prisoners of war, in addition to other installations. This additional load on water production and transportation, together with equipment tied up temporarily in other Army areas occasioned by the shifting zones of action, resulted in all available water production and equipment being utilized to the fullest extent. Sufficient mobile production units were not available; therefore, portable units using two filters or two portable units with one unit using two filters were used at a water point to meet the demand and operate within the allowable filter rate of 10 gallons per minute for portable unit filters. Fifty 250 gallon water tanks were located and placed in Allied prisoner of war camps and prisoner of war enclosures for storage. Platforms were constructed and 3,000 gallon canvas tanks placed thereon were also used for storage facilities in these installations.

During the month Army troops operated forty-five water points and ten water distributing points. These water points produced approximately 9,676,000 gallons of water during the month. A total of eight mobile units and twenty-six portable units were used for producing water. Thirty-nine 700 gallon tankers and fourteen 1,500 gallon trailers were used for hauling water to installations.

Three Views of Water Supply to Prisoner of War Enclosures

VII - CAMOUFLAGE

The mission of the Army Camouflage Company was to support the operation through the assistance, technical advice, and execution of camouflage missions in the Third U.S. Army sector. The first, second, and fourth platoons continued in support of the corps to which they were attached. The chief concern was supply, which suffered greatly because of the rapid movement and long supply lines. Camouflage materials were relocated at Engineer Depot No. 99, where two enlisted men continued to handle records and stocks of camouflage supplies. Materials remained in short supply, large quantities being in transit from rear dumps.

Two German camouflage installations were inspected. On 5 April a former partially concealed airport approximately five miles west of FRANKFURT (M-6768) was inspected, and on 12 April a dummy airfield near WALTERHAUSEN (J-0560) was inspected. This installation was a very good example of German camouflage. It was located in a steeplechase grounds

DECLASSIFIED

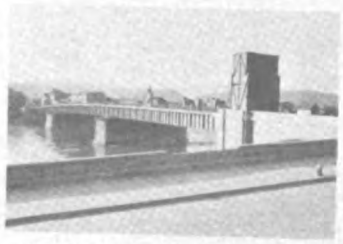
Treadway Bridge across Isar River at Landau

Treadway Bridge over Isar River at Moosburg

Thereafter, with one more big river to cross, the III and XX Corps speedily pushed on to the INN River, a formidable river 400 to 700 feet wide, for which plans for a major assault crossing were made. Fortunately, however, the speed of the advance had demoralized resistance and passages were possible over existing structures in each corps, a bridge being captured by III Corps and two dams by the XX Corps. Again bridges were quickly put in at PASSAU (J-2213), SCHAERDING (Q-2100), and BRAUNAU (Z-9377) and the march to the south continued by XX Corps alone, since III Corps had reached its final river to cross.

Heavy Pontoon Bridge over Inn River at Passau

XX Corps pressed rapidly toward LINZ (V-8787), Austria, capturing most of the bridges over the TRAUN River intact on the way. At LINZ (V-8787) the existing highway bridge over the DANUBE shown in the photograph below was captured, though credit for this went to XII Corps which, abreast of XX Corps, had raced down the east bank of the DANUBE River to arrive at LINZ (V-8787) just before XX Corps. Also, while on the way, the heavy ponton bridge shown in the photograph below was put in over the DANUBE River at PASSAU (Q-2213) by XII Corps.



Highway Bridge over the Danube River at Linz

Heavy Ponton Bridge across the Danube River at Passau

From LINZ (V-8787) onward both corps pressed southeastward with but little hindrance from destroyed bridging until on 8 May, with XX Corps already partially across the INN River, the word of final victory halted tactical bridging operations of Third U.S. Army in the Battle of Germany.

The major fixed bridge construction included bridges across the DANUBE, ISAR, and INN Rivers. Fixed timber bridges were under construction across the DANUBE River on the Autobahn highway at INZELL-DORF (T-7125), on N-16 at WINDORF (T-8526), on N-8 and 15 at REGENSBURG, on N-11 at DEGGENDORF (U-8239), and on N-12 at PASSAU (J-2213). The existing highway bridge across the DANUBE River at LINZ (V-8787) was captured intact. Construction was also begun on fixed timber bridges across the ISAR River at PLATTLING (U-7733) on N-8, at LANDSHUT (U-2505) on N-11, at MOOSBURG (Z-1194), and across the INN River at SCHAERDING (Q-2100).

Bridge over Danube River in Linz Captured Intact

Bridge across the Inn River at Scharding. Bailey bridge across demolished spans.

Bridge across Danube River at Deggendorf under construction

Bridge across the Danube River at Passau under construction

During this period a 200-foot fixed timber bridge was completed on the Autobahn highway south of NURNBERG (U-4300). Piers on this two-way bridge averaged fifty feet in height.

Road maintenance, which included asphalt patching, leveling and surfacing craters, and drainage improvement, was inaugurated to preserve the existing surfaced arterial highways. Prior to this time the movement of the Army was so rapid that very little attention could be devoted to this work, since the major task was constructing fixed timber bridges to improve traffic circulation and relieve tactical bridging for operations ahead.

Digitized by Google

Labor Construction

With the ever-increasing tonnage of prisoners of war surrendering, and the inability of overtaxed rations zone to remove them from the Army area as readily as before, release of the long distances to be covered and the large numbers of prisoners to be transported, the problem of housing and feeding the prisoners of war became a "must" mission of high priority.

Accordingly, Army engineer and Type engineer troops were called upon to construct enclosures to hold about 400,000 prisoners. Through the prisoners themselves were used to a maximum on the work, the operation of getting materials from local sources and providing water, sanitation and shelter for sanitary facilities required a considerable amount of engineer work and troops.

By this time it became known that Army and Corps would eventually have more engineer troops than they could employ to advantage. Accordingly, many of the engineer troops were released to the Communications Zone to facilitate the setting up of permanent bases established by the Engineer Section so that by 8 May Phase III of World War II, involving the occupation of Germany and the evacuation of displaced persons and liberated prisoners of war, was underway from the standpoint of the engineers.

III - SUPPLY

Supplying forward bridge troops with tactical bridging and assault equipage, and following up depot stocks of Class II, IV and Bridging at Depot No. 14 were the major functions of the Supply Subsection during this period.

Ten new trucks and trailers were received from Advance Section Communications Zone in order to alleviate the critical shortage of this item. Total Table of Equipment strength of Bailey bridge construction trucks remained at approximately forty vehicles.

Depot stocks of Bailey bridge, treadway bridge, and assault equipment, although low, were adequate to support the advance. There were no demands on the Army depot for tactical timber.

Listed below is pertinent information on Army depots in operation during 1 May through 8 May

Depot No.	Location	Type Supplies	Average Tonnage
14	Perth, Germany	II, IV and Bridging	[illegible]
43	Amberg, Germany	IV and Bridging	700
44	Straubing, Germany	IV and Bridging	700
45	Dreeding, Germany	IV and Bridging	200
46	Straubing, Germany	IV and Bridging	200
47	Moosburg, Germany	IV and Bridging	200

Depots were set up on New Engineer Maps, 1:50,000 scale, and an inventory taken on equipment supplied. Units under army were guarding and inventorying depots throughout the area.

The engineer railhead was moved from Augsburg (U-4754) to Freising (U-4844), where railheads could be situated directly on the Army depot. Initial requests were submitted for increased materials as soon as requirements for higher priority materials were known. Movement of supplies into forward depots was handled by the Assistant Engineer Section Group and attached units.

Engineer maintenance facilities were greatly increased by the addition of the 14th Engineer Maintenance Company. This unit operated close to the Army depot and performed third and fourth echelon work, in addition to servicing returned enemy equipment, such as generators. Spare parts supply remained adequate.

IV - MAPS

The Army Survey Center completed seven reported survey targets. A few of these targets yielded unfavorable results and survey data which were all turned over to the troopteam. Two targets contained photogrammetric and survey instruments which were passed to the rear through map distribution channels and turned over to the troopteam.

Control was furnished for three different radar stations. As there were no existing trig lists for these areas based on the Bessel grid, it was necessary to use captured German data and convert the rectangular coordinates from German Soldner-Krueger to World Polyconic coordinates.

A revision program consisting of twenty-six sheets of the Bavarian 1/50,000 series maps was assigned to Third U.S. Army by Twelfth Army Group. Photographs were received and work was begun on this project.

A project was initiated to produce 1/50,000 scale maps of Bavaria with the political boundaries overprinted thereon. This entailed transposition of the boundaries from existing smaller scale maps onto the 1/50,000 scale maps. The facilities available limited the speed of this project and therefore no completion date was set.

Arrangements were made for town plan compilation of occupational areas. G-2 listed the towns for which town plans were desired. G-5 and all corps were requested to aid in securing reproducible copies of these towns to be used as a basis for reproduction. The reproduction and consumption of operational maps abated somewhat. Pertinent statistics on maps received and issued during the period are listed below:

Total maps received during the period:

Scale	Tons	Sheets
1/25,000	0.0	- 0 -
1/100,000	11.7	233,950
1/50,000	26.3	525,500
1/200,000	6.0	120,750
Miscellaneous	1.7	34,440
Total	45.7	914,640

Scale	Tons	Sheets
Issued to Army Units:		
1/25,000	0.0	- 0 -
1/50,000	2.9	59,062
1/100,000	1.8	36,340
1/200,000	1.2	24,051

Three charts showing the reproduction and consumption of maps by Third U.S. Army since becoming operational on 1 August are shown in Annex No. 10. It is interesting to note the cycles of map consumption in relation to the tactical situation.

V - INTELLIGENCE

Studies on the Topography of Bavaria and Austria, Roads of Austria and Bridges of Austria were distributed to interested units.

Engineer Intelligence Bulletin No. 8 was produced and issued to Corps, Divisions and all Engineer units.

The 2990th Engineer Technical Intelligence Team continued to examine enemy engineer depots and factories for the recovery of material necessary for technical research. An enemy Goliath Demolition tank was examined and a report rendered to higher headquarters.

VI - WATER SUPPLY

Because of the enormous numbers of displaced persons and prisoners of war in the Army area, it became necessary to supplement the water haulage facilities of the two water supply companies with improvised equipment. For this purpose, 21-ton trucks were mounted with captured German tanks and fitted with pumps. All available water production equipment was utilized to its fullest extent during this period. Flatforms with 3,000-gallon canvas storage tanks were placed in prisoner of war enclosures.

CHAPTER 13
LESSONS LEARNED & CONCLUSIONS

I. TROOP LIST.

For the type of operations encountered in this theater, the following list of Engineer troops is considered ideal for Field Army:

A. Troops attached to each Corps:

(1) Two Engineer Combat Groups, each consisting of:

Engineer Group Headquarters
Three Engineer Combat Battalions
One Engineer Light Equipment Company
One Engineer Dump Truck Company

(2) One Engineer Maintenance Company.

(3) One Engineer Topographic Company.

(4) Two Engineer Light Ponton Companies, loaded with fixed Bailey bridge.

(5) One Engineer Treadway Bridge Company per each armored Division of Corps, plus one additional Engineer Treadway Bridge Company per Corps, to provide bridging for Infantry divisions.

B. Troops assigned to Army:

(1) One Engineer Combat Group directly in support of each front line Corps, each Engineer Group consisting of:

Engineer Group Headquarters
Three Engineer Combat Battalions
One Engineer Light Equipment Company
One Engineer Dump Truck Company

(2) One Engineer General Service Regiment directly in support of each Army Engineer Combat Group in support of front line Corps. To each regiment should be attached one Engineer Light Equipment Company and one Engineer Dump Truck Company.

(3) Two Engineer Maintenance Companies.

(4) One Engineer Topographic Battalion.

(5) One Engineer Depot Company.

(6) Two Engineer Water Supply Companies.

(7) Four Engineer Heavy Ponton Battalions.

(8) One Company of Engineer Camouflage Battalion.

(9) Four Engineer Fire Fighting Platoons.

(10) One Engineer Utilities Detachment.

(11) One Engineer Survey Liaison Team.

(12) An urgent need was found for an Engineer Service Group which can handle and coordinate Army supplies and their transportation.

(13) One Engineer Forestry Company.

(14) One Gas Generating Unit.

II. ENGINEER OPERATIONS.

A. Simplicity of Orders.

(1) Attachment, detachment and movement orders issued by Army to Army Engineer troops were made simple and concise, usually by telephone or through liaison officer and confirmed by simple field message. Attachment and detachment orders were subsequently confirmed through command channels.

(2) Instructions for engineer work were best given by overlay, assigning areas of responsibility and containing instructions in five-paragraph field order form. Specific tasks were given by written job orders with priority of work indicated.

B. Sequence of Bridging.

(1) Bridging operations be t adapted to support a rapidly advancing army are in the following sequence:

1. Construction of floating treadway or heavy ponton bridges immediately following the initial assault crossing.

2. Construction of fixed Bailey bridge to replace floating bridge which in turn can be moved forward to support future operations.

3. Replace Bailey bridge with a two-way Class 40, one-way Class 70 fixed timber bridge. Bailey bridge is then removed and hauled forward to corps bridge dump.

C. Major River Crossings.

(1) In assaulting major river crossings, such as the MOSELLE or RHINE, corps should be assigned the task and necessary troops attached to accomplish the mission. Prior to the crossing, selected troops should be given special training in the erection of anti-barge booms and anti-personnel nets and booms.

(2) When practical, especially during a rainy season, gaging stations should be established upstream of crossing sites to warn of impending rises. Reports on possible flooding should be available before the assault crossing is made, as well as for subsequent usage.

(3) Supply of assault and bridging material is the most critical factor in all crossing operations. Because of the bulk of this type equipment, the moving of it is a time-consuming task, and it is imperative that, once a river crossing becomes imminent, every effort be immediately started to move the required equipment to the vicinity of the proposed crossing. Supplies should be based on providing a 100% reserve in assault boats and other items of assault equipment. Reserves of bridging can be smaller, but on strongly resisted crossings, losses up to 50% can be expected. The number of crossings made per stream is variable, but for planning, materiel to support a division crossing every ten miles of stream length should be provided.

(4) In executing assault crossings, secret crossings, i.e., those made without artillery preparation, were, in general, more successful than those made with preparations.

(5) Paddled assault boats, even in swift rivers, are the most suitable craft for crossing the assault troops. The noise of the motors in powered craft attracts the attention of the enemy and heavy shells draws fire. Powered craft have been used successfully for feints, and can be used once small arms fire has been cleared from the crossing site; they are extremely valuable for evacuating wounded and for supply.

(6) Naval craft LCVP's and LCM's are invaluable as a crossing means on major rivers 600 or more feet wide. The volume of troops and supplies that can be transported by them is far greater than that which can be supplied by any other practical means until a bridge is built. However, unless very close coordination is established between them and the traffic control authorities in charge of the crossing, much valuable transport time will be wasted waiting for loads.

(7) Smoke is an invaluable adjunct in river crossings, but must be employed to screen a large area surrounding the exact crossing site to be most effective.

(8) Before bridge construction is started, houses and other possible observation posts within sight of the crossing site must be definitely cleared of enemy observers.

(9) "Shellrep" teams are valuable at bridging sites so that counter-battery artillery fire may be quickly employed.

D. Bridging.

(1) Treadway bridges are the preferred tactical bridges because of their speed of erection, slight maintenance requirements, load capacity and ability to withstand swift currents. However, aggressive, intelligent traffic control is necessary to assure the complete utilization of the capacity of this type of floating bridge.

(2) The Heavy Ponton bridge has a slightly higher traffic capacity than the treadway bridge, but because of the transportation required, the lower load capacity and its inability to take heavy loads in swift currents, it is definitely not the equal of the treadway bridge.

(3) The floating Bailey bridge has a higher traffic and load capacity than the treadway bridge, but because of the transportation required and the time required for construction, it is not regarded as being as suitable a tactical bridge as the treadway, but is regarded as being a very desirable replacement bridge for the treadway.

III. SUPPLY.

Supply activities required the augmentation of the Engineer supply installations with an Engineer Combat Group to coordinate depot haulage. It was also necessary to utilize the hauling facilities of two or three Engineer Heavy Ponton Battalions and several Dump Truck and Light Ponton Companies. To obviate utilizing combat engineer units on service functions, an Engineer service organization is urgently needed. Such an organization should consist of an Engineer Service Group Headquarters with attached transportation units equipped to haul Engineer depot stocks, and Engineer Service Companies for the operation of railheads, dumps, etc.

The present Depot Company T/O & E should be revised to include one more depot platoon and at least ten crane operating teams.

IV. MAPS.

Experience gained in operations on the Continent has proved that map supply and distribution can be adequately and efficiently accomplished within Army for either a fluid or static situation through the medium of an Army Map Depot, one Corps Map Depot for each Corps, and one Division Map Depot for each Division. To properly operate the Army Map Depot, it is recommended that the Map Storage and Distribution Section of the Headquarters and Service Company for an Engineer Topographic Battalion (Army) be increased. It is likewise recommended that a Map Storage and Distribution Section be added to the Engineer Topographic Company (Corps). Adequate personnel are available in the Engineer Combat Battalion of the Division to operate the Division Map Depot. By having the Army and Corps Map Depot personnel as part of the respective Army or Corps Topographic unit, overhead personnel for administration and messing can be absorbed by the parent unit. Furthermore, the parent unit provides a reserve of personnel and transportation during peak activities so characteristic of mapping during the more rapid advances of mobile warfare. Normally, all technical branches of the topographic units, survey, photomapping and reproduction, are not operating full capacity at all times.

STRATEGIC TERRAIN ANALYSIS

1. PURPOSE AND OTHER LIMITING CONSIDERATIONS:

This report is an extension of the Strategic Terrain Analysis - N.W. France previously prepared and included as Section I in Target Area Analysis No. 1, Headquarters Third U.S. Army, dated 23 April 1944. The additional area of France included in this study (see sketch No. 1) is bounded on the north by the LOIRE River from NANTES, 0456, to ORLEANS, 6047, and then by a line from ORLEANS, 6047, to PARIS, 4851. The southern boundary of the area is a line from LA ROCHELLE, 3194, to VICHY 6401, thence to CHALON SUR SAONE, 4504. The upper SEINE River south of PARIS, 4851, provides the eastern boundary for the area. (Principal sources of information: STRATEGIC ENGINEERING STUDY NO. 87 - FRANCE TERRAIN INTELLIGENCE by U.S. Geological Survey and STRATEGIC ENGINEERING STUDY NO. 71 - INLAND WATERWAYS OF FRANCE by Office, Corps of Engineers.)

2. GENERAL TOPOGRAPHY OF THE AREA:

a. Drainage System. (See Sketch No. 1)

Practically the entire area is drained by the LOIRE River and its southern tributaries. The only exception being the area just southeast of PARIS, which is drained by the SEINE River and its tributaries, and the narrow coastal strip on the west which is drained into the Atlantic Ocean by several small and relatively short rivers.

The major rivers in the area are the LOIRE and the SEINE; however, a number of the tributaries of both these rivers are considered important streams with a mean discharge of over 500 cubic feet per second (probably not fordable except in very dry seasons). Among these are the VIENNE, CHER and INDRE rivers, tributaries of the LOIRE River, and the YONNE and MARNE river, tributaries of the SEINE. All of the tributaries generally flow in north or northwest direction and several are canalized or bordered by canals. (See sketch No. 2.) The LOIRE is considered navigable for flat bottom 50 to 80 ton capacity, barges from NANTES, 0456, through ORLEANS, 6047, to BRIARE, 8041, and is then bordered by a navigable canal from BRIARE, 8041, to MARNY, 6048. The VIENNE River is navigable from its confluence with the LOIRE River to CHATELLERAULT, 0343, a distance of 14 miles. The LOIR River, a portion of which has been canalized, is navigable from VIENCUN Village, 7441, to its confluence with the LOIRE, a distance of 5 miles. The ALLIER River is navigable from PONTANEVAUX, 4041, to the LOIRE River, a distance of 17 miles. However, the navigation on this stream is relatively unimportant as the average depth is only 1.5 feet.

The SEINE River is navigable from its outlet at LA HAVRE to MERY SUR SEINE, 1647, a distance of 191 miles. The YONNE River, a tributary to the SEINE River, is navigable from MONTEREAU, 1918, on the SEINE River to AUXERRE, 4314. The YONNE River also forms a connection for the NIVERNAIS and BOURGOGNE canals with the SEINE River. The principal canal connecting the SEINE and LOIRE Rivers extends in a north-south direction from ST. MAMMES, 7648, on the SEINE River to BRIARE, 8041, on the LOIRE River, a distance of 65 miles. The CENTER Canal, extending from DIGOIN, 0766, to CHALON SUR SAONE, 4502, connects the lateral canal of the LOIRE with the navigable SAONE River which flows southward into the Mediterranean Sea. This canal crosses the divide between the SAONE and LOIRE Rivers and is 74 miles in length. The only other canal of importance in this area is the BURGUNDY canal which extends from LANDRECIES, 1241, on the YONNE River southeasterly through DIJON, 6461, to ST. JEAN DE LOSNE, 5408, on the SAONE River. This canal provides a navigable waterway through the middle of France from the English Channel to the Mediterranean Sea.

Most of the streams in the area flow in level, narrow bottom lands bordered by steep bluffs 4 to 20 feet high. The area south of ORLEANS, 6047, and the area west of CHATEAUROUX, 4041, are dotted with lakes and swamps which are partly drained by ditches.

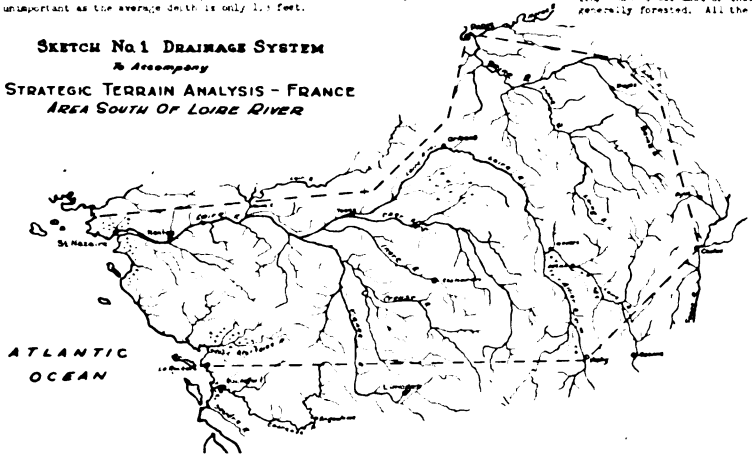
b. Ridge System (See Sketch No. 3)

Within the area under consideration there is no distinct or predominant ridge line pattern. The terrain is generally comprised of broad plains and plateaus, interrupted in places by valleys and rough hilly areas. The low dissected plains of the LOIRE basin rise gradually in the south to merge with the central plateau. This plateau is bisected by the upper courses of the LOIRE tributaries to form rough flat-topped spurs and ridges trending toward the north and northwest. The streams have cut more deeply into the plains particularly POITIERS, 0734, forming steep sided valleys 50 to 100 feet in height. The relatively high plateau country merges into rough and hilly country in the vicinity of MONTBARD, 2447. Broken and hilly terrain also exists east of NEVERS, 6344, in the extreme southeast portion of this area.

c. General Nature of the Terrain

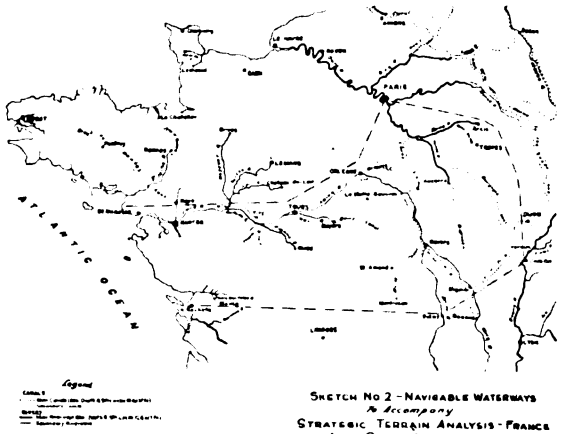
There is no rugged mountainous country within the area under consideration. The altitude increases from about 50 feet in the valley bottoms below TOURS, 7443, to about 800 feet in the extreme southeastern part. The terrain generally consists of low rolling hills similar to that in the LOIRE River Valley, southward approximately 50 miles where they merge into a high plateau area. In the transition zone, due to this general topographic pattern are the low swampy areas, south of ORLEANS, 6047, west of CHATEAUROUX, 4041, and along the river valleys south of POITIERS, 0734. The coastal strip on the west contains several long beaches but most of these are backed by a low swampy area and are generally forested. All the beaches are exposed to prevailing westerly winds, Atlantic swells and a tidal range of 12 feet. Principal ports are ST. NAZAIRE, 1734, at MANTES, 4756, both of which are situated on the estuary of the LOIRE River. In the LOIRE basin, which comprises the central portion of the area, the soil is fertile and is cultivated extensively in most parts. The swampy area south of ORLEANS, 6047, is most fully covered by forests and is used principally for agriculture lands. The dry chalk area southeast of TOURS, 7443, is practically barren except for scattered forests which are used principally as pasture lands. Principal cities are MANTES, 4756, with a population of 17,000; ORLEANS, 6047, with a population of 72,000; TOURS, 7443, with a population of 80,000; and POITIERS, 0734, with a population of 30,000. Tours, the largest city in France and the center of silk industry. All the above named cities are located either on the LOIRE or SEINE Rivers, the extreme north boundary of the area under consideration. There are several other relatively important cities in the southern portion of the area ranging in population from [illegible], Blois, POITIERS, [illegible], CHATEAUROUX, [illegible], TOURS, MONTARGIS, [illegible], Pithiviers, and MONTBARD, [illegible]. Each of these cities is a focal point for several of the principal highways.

3. MILITARY ASPECTS OF THE TERRAIN:



There is a closely knit, intricate network of roads covering the entire area as shown in Sketch No. 4, attached. An efficient, wide hard surfaced highway connect principal towns, while numerous hard-surfaced secondary roads offer possible alternate routes. Towns are rarely by-passed and are serious obstacles to through traffic because of narrow, irregular streets and closely spaced buildings of stone and masonry. Road blocks are not very effective as there is generally adequate space for detours and many alternate routes. Tributary rivers and canals are easily bridged by portable and other types of temporary bridges. Tributary streams can be forded in many places during dry seasons, these are also easily bridged. LOIRE River is unfordable during high water, but can be forded in a number of places during dry seasons. Cross country movement of tracked equipment is generally unrestricted except south of ORLEANS, 6047, where many ground and extensive forest cover the movement is made in a few open areas. In the high plateau area along the southern boundary large forests afford ample concealment for armored vehicles. In addition to the excellent communication facilities afforded by the intricate network of hard roads as indicated on sketch No. 4, attached, there is also an extensive network of railroads throughout the area. Considerable partition to these lines is anticipated, however, prelimination of several of these lines may be anticipated due to permit their use in support of operations undertaken in this area.

4. CRITICAL TERRAIN FEATURES:



Principal terrain features are the marshy areas, the LOIRE River and its northern system of tributaries. Some of these tributaries flow through narrow but relatively high, bluffs from 10 to 40 feet high. The ridge and field cultivation pattern of the agricultural region, the scattered forests throughout the area and the numerous small towns with narrow streets are additional critical terrain features.

OPERATIONS MEMORANDUM:

NUMBER 22:

ASSIGNMENT AND DETACHMENT OF SURVEY CONTROL BY ARMORED ELEMENT OF ARTILLERY AND ENGINEERS

1. REFERENCE

SHAEF Operations Memorandum Number 28, "Artillery and Engineer Survey", dated 25 April 1944.

2. AGENCIES INVOLVED

a. Topographic Section (Engineer Section, Hq. Third Army).

b. Army Survey Center (Survey Platoon, Engineer Topographic Battalion).

c. Survey Information Center (Field Artillery Observation Battalion and Corps Survey Platoon, when attached).

3. RESPONSIBILITIES

a. Topographic Section
(1) Will assemble, evaluate and distribute the trig lists for the Army operational areas.
(2) Will direct and supervise the activities of the Army Survey Center.
(3) Will file copies of all new, revised and captured trig lists and lists of coordinates as obtained or produced by army units within this plan.

b. Army Survey Center
(1) Will be responsible for the recovery and extension of points comprising the major net.
(2) Will furnish Corps with points with which to start lower order nets.
(3) Will establish azimuth and furnish to Corps the angles of declination between true azimuth and grid azimuth as required.
(4) Will act as a reserve to help Corps SIC when necessary
(5) Will tie in Corps nets where differences exist.
(6) Will supply control to Artillery units retained under Army control. This may or may not be accomplished together with a FA observation battalion.

c. Survey Information Center
(1) Will extend lower order survey, from the major net furnished by Army Survey Center, to Corps, Division and Battalion areas.
(2) The SIC will be in charge of the CO of the Field Artillery Observation Battalion. The Engineer Survey Platoon (Corps) will be attached to the SIC only as needed. It will be the responsibility of the Corps Engineer to see that its functions are performed in accordance with the general scheme of this plan. It will be the responsibility of the CO, Field Artillery Observation Battalion, that the talent of the Survey Platoon be utilized in the mission set forth in paragraph 3c(1), above, and not used as a check on work done by Artillery personnel.

4. TECHNIQUE

a. The methods used by the Army Survey Center will conform to standard practice for 1:500C accuracy or better.
(1) Azimuths should be based on star observations which will be made during daylight whenever possible.
(2) Computations by machine or logs will be made in the field with final check at headquarters.

b. Corps Survey Information Center
(1) Triangulation will be carried out by these units whenever possible and will be same order as major net.
(2) Transit traverse will probably be used in most circumstances.
The order of traverse should be to an accuracy of 1:5000. This can be accomplished by double reading of the angles, single chaining with stadia checks, and star observations for azimuth.
(3) With proper training, survey of this order can be obtained with a minimum of personnel.
(4) Points where accuracy is below 1:5000 should not be furnished to units of Division or higher. However, this will not be construed to mean that points of slightly less accuracy will be withheld from units when there is combat need for them.
(5) For work from Division to Battalions, control should be held to an accuracy of 1:3000 or better, and usually will consist of lines of transit traverse with either star or sun azimuths.
Computations should be sufficiently accurate to maintain instrument accuracy.
(6) In the event that time permits the establishing of lines from Battalions to gun positions, these can be run with a transit, with distances by stadia, or by graphic plane table methods.
The accuracy to be held to 1:750 or higher and computation made by logs or slide rule.

By command of Lieutenant General PATTON:

HUGH J. GAFFEY,
Major General, U. S. Army,
Chief of Staff.

OFFICIAL:

H. G. MADDOX,

APO 403

5 June 1944.

OPERATIONS MEMORANDUM:

NUMBER 11:

DISTRIBUTION OF OPERATIONAL MAPS

1. MAP TABLES. "Initial Issue Tables for Operational Maps," inclosed herewith, lists the selection and quantities of operational maps and auxiliary material for initial issue in forthcoming operations. The quantities are based, in general, on map allowance tables in letter, Headquarters Third U.S. Army, 19 May 1944, file AG 061-CHMCR, subject: "Map Supply Policy". The inclosed table will be the basis for all future map requisitions required in operations to D plus 90, inclusive. Auxiliary mapping material listed in columns 14-17, inclusive, will be issued by the Army Engineer as soon as available direct to Corps Headquarters, Divisions, and Army and Corps separate units. All other maps and mapping material will be issued in accordance with instructions below.

2. DISTRIBUTION IN UK FOR BUILD-UP TROOPS. TUSA troops not landing in assault will be issued at a place and time after D-Day specified by the Army Commander all maps shown in columns 2, 3, 4, 5, 6, and 13 of inclosed tables, in addition to those maps listed in column 7 for Corps headquarters and divisions. These maps will be issued in the following manner:

a. Under supervision of the Army Engineer, personnel of the map storage and distribution platoon of the Army Topographic Battalion will draw bulk maps from an ETOUSA map depot for Army Headquarters and Army separate units, break down bulk stock to unit loads, and distribute "over the counter" to all Army separate units. To accomplish this, the Army Engineer will -

(1) Submit to ETOUSA requisitions covering above bulk order forwarding copy to the Army Topographic Battalion.

(2) Furnish the Army Topographic Battalion the necessary information for breaking down bulk stocks to unit loads.

(3) Notify all Army separate unit commanders when and where to draw their bulk maps.

b. Under supervision of the Corps Engineer, Corps map depot personnel will draw bulk maps from an ETOUSA map depot for Corps Headquarters and Corps separate units (to include Army separate units attached to XI and XII Corps for movement to continent), break down bulk stocks to unit loads and distribute "over the counter" to all Corps separate units. To accomplish this, the Army Engineer will -

(1) Submit to ETOUSA requisitions covering above bulk order forwarding copy to the Corps Engineer.

(2) Notify the Corps Engineer when and where to draw his bulk maps.

c. Under supervision of the Division Engineer, the Division map depot personnel will draw bulk maps from an ETOUSA map depot for Division Headquarters and Divisional units, break down bulk stocks to unit loads, and distribute "over the counter" to all divisional units. To accomplish this, the Army Engineer will -

(1) Submit to ETOUSA requisitions covering above bulk order forwarding copy through the Corps Engineer to the Division Engineer.

(2) Notify the Corps Engineer when and where the Division Engineer is to draw his bulk maps.

3. DISTRIBUTION IN UK FOR ASSAULT TROOPS. TUSA troops landing in assault will be issued at a place and time after D-Day as specified in the order moving the unit to the concentration area all maps shown in inclosed table necessary for the assault. This will normally include those maps listed in columns 2-10, inclusive, 12, 13, and any special maps that may be available.

a. Requisitions.

(1) The Engineer of the Corps assigned an assault mission will immediately furnish the Army Engineer a list tabulating all Divisions and Corps separate units in the assault and the sheet number of maps, scale 1/100,000 and larger, required by each tabulated unit for the assault.

b. Distribution. All maps and auxiliary mapping material will be drawn from ETOUSA map depots as follows:

(1) Officer representative of Army Engineer draws for Army Headquarters.

(2) Officer representative of Corps Engineer draws for Corps Headquarters.

(3) Officer representative of Division Engineer draws for the Division.

(4) Unit S-2 draws for Army or Corps separate units.

4. SECURITY. An officer drawing operational maps in the UK, either for build-up or assault troops, will be required to identify himself to the officer in charge of the ETOUSA map depot by showing his AG identification card and a copy of the unit's requisition. Lacking details from higher headquarters, the unit loads for Army and Corps separate units and Divisional units will be classified Top Secret-Bigot and handled as such. Security responsibility is charged to commanders responsible for the unit breakdowns. No unit bundle will be broken for organizational use until the unit is in an area under rigid security control through which these maps and the information they contain cannot leak. The Marshalling Area or a ship from which NO debarkation will take place except in a similarly controlled area are cited as examples. In addition to the security precaution outlined above, the map rolls will not be opened and rearranged until briefing is about to take place.

5. DISTRIBUTION OF MAPS IN CONTINENTAL EUROPE.

a. Army separate units will requisition direct to the Army map depot for "over the counter" delivery.

b. Corps separate units will requisition direct to the Corps map depot for "over the counter" delivery.

c. Division Engineer will submit consolidated requisitions to the Corps Engineer. These maps will be delivered in bulk by the Corps depot personnel to the Division depot.

d. Units mapped in the UK as build-up troops upon arrival on the continent will receive their initial issue of topographic maps, scale 1/100,000 and 1/50,000, without requisition, by "over the counter" delivery from their respective Army or Corps map depot. Army Engineer and Corps Engineer will inform their respective depots in advance sheet numbers of these maps required by newly arrived divisions and separate units for "over the counter" delivery.

e. Special issue maps, columns 9, 10, 11, and 12, will be issued to build-up troops upon arrival on the continent in accordance with procedure outlined in paragraphs 5a, b, and c.

f. Corps depot will be made operational on the continent upon arrival of the first organic Corps unit unless arriving in assault. Pending establishment of Army map depot, the Communications Zone advance map depot for Third U.S. Army will be functioning as an Army map depot.

6. LATE ARRIVAL ARMY UNITS. Army units arriving in the UK after Headquarters Third U.S. Army closes in the UK and opens in the continent, will be mapped in the UK in accordance with this Operations Memorandum by the Corps to which the unit is attached for movement to the continent.

By command of Lieutenant General PATTON:

HUGH J. GAFFEY,
Major General, U. S. Army,
Chief of Staff.

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

17 April 1944

TRAINING MEMORANDUM:

NUMBER 2:

TRAINING OF ENGINEER UNITS

1. PURPOSE: The purpose of this directive is to furnish a guide to Engineer units so that the maximum utilization of the remaining time will be made for training.

2. OBJECTIVE: The objective of the training in the UK is to bring the units up to the standards which will enable them to perform their primary missions in an efficient manner.

3. SCOPE: a. Engineer units have completed basic, unit, and in most cases combined training in the United States. Further training should perfect the unit performances of the company, battalion and group in the various engineer operations.

b. All engineer units will attain the proficiency requirements as indicated in Training Bulletin No. 12, Hq ETO OCE, 15 February 1944.

c. Priority of proficiency requirements of divisional or corps engineers will be prescribed by the appropriate commander.

d. Army combat battalions will attain highest proficiency in subjects in the following priority:

(1) Roads: Training in construction and maintenance of roads normal to missions of army engineer units will include: repair and maintenance of all types of existing hard surfaced roads, the construction of beach exit roads, by-passes, and the widening of roads. Training will stress maximum use of mechanical equipment and utilization of captured equipment and materials. Basis of training standards will be Chapter 1, FM 5-10.

(2) Military Bridges: Training will consist of actual construction of the various types of bridges in the following priority: (a) Fixed Bailey (b) Floating Bailey (c) Treadway (d) 25-ton Pontoon (e) Fixed Timber (f) M-3 Pneumatic Pontoon. All officers will be trained to estimate bridge capacities using the British Classification System. See ETOUSA Operations Memorandum No. 7, dated 5 March 1943, as amended by C1, 14 May 1943 and C2, 27 May 1943.

(3) Mine Warfare: Training will be in compliance with TM No. 9, Hq ETOUSA, 28 March 1944.

e. Army engineer units other than combat Battalions will become proficient [illegible]

DECLASSIFIED

Digitized by Google

be scheduled so that the unit working parties will be attached whenever practicable to their units for operations applicable to their specialty. All units will be trained in the location and neutralization of enemy mines.

f. Engineer Reconnaissance: All officers and senior NCO's will be trained to conduct general engineer reconnaissance. Emphasis will be placed on road, bridge and material reconnaissance. (Reference Chapter 7, FM 5-6.

g. Training programs will be prepared so as to incorporate appropriate subjects to meet the standards of the following publications:

ETO-USA TRAINING MEMORANDA

TM - 1	23 February 1943	Lessons from North Africa
TM -18	29 June 1943	Training for Staff and Communications Personnel
TM -25	7 August 1943	Conduct of Field Exercises
TM -38	6 November 1943	Training
TM -40	11 November 1943	Defense Against Chemicals in Combat
TM -41	27 November 1943	Beach Reconnaissance
TM -44	27 November 1943	Aircraft Identification Training
TM - 7	28 March 1944	Mines, Minefields, Booby Traps and Demolitions

h. Training will be conducted where possible in the form of field exercises under tactical conditions. Map reading, concealment and camouflage training will be incorporated into all training as well as being treated as separate subjects. Camouflage discipline will be constantly stressed. Inclement weather will not alter training programs. A minimum of 10 percent of training time will be scheduled at night. At least two replacements will be trained as operators of technical equipment.

4. GROUP RESPONSIBILITY: a. The Group Commander is responsible for the training of all units of his group and will coordinate training activities as follows:

(1) Closely supervise all training within the group.

(2) Schedule combined training exercises between subordinate units.

(3) Coordinate the use of all special training aids and training sites available to the group.

(4) Approve monthly training programs for compliance with this memorandum and directives of higher headquarters.

(5) Allocate school quotas which will become available to the group.

(6) Conduct training inspections and tests.

b. The Group Commander will establish necessary facilities and/or schools for the training of all communication personnel of the group and subordinate units.

5. SCHOOLS: a. Schools will be used to the fullest extent to train instructors within units and to provide qualified personnel for key positions. Officers and men who have graduated as instructors will be used to conduct training within their own units so that the greatest advantage will be obtained from the instruction that has been given to them. Special effort will be made to provide alternate personnel capable of filling key positions.

b. Corps, divisions and separate army units down to include battalions will provide their own unit schools as far as possible when a need for such instruction exists. If there are no competent instructors available within units, this headquarters will be notified so that the necessary instructors may be trained at existing schools. If the need for a school is acute and no instructors are available within the unit concerned, this headquarters will endeavor to assign instructors necessary to conduct the school.

6. TRAINING TESTS AND INSPECTIONS: a. At the conclusion of various phases of training, tests will be conducted by the unit commander for the purpose of determining proficiency.

(1) Practical Work: A report will be rendered through engineer channels showing performance of the unit in the training as to type, quantity, rate, and quality.

(2) Written and oral tests will be given to determine individual qualifications.

b. Unit commanders will conduct training inspections a minimum of once weekly. These inspections will stress condition of individual equipment, vehicles, weapons and tools, as well as small unit efficiency.

c. Frequent inspections will be made by the Third Army Engineer and by the Group headquarters. These inspections will be coordinated with the training tests and will stress the following:

(1) Organization of training and/or work.
(2) Combined tactical and technical training.
(3) Officer and NCO leadership.
(4) Use of training aids.
(5) General condition of mess, barracks, latrines, and CP.
(6) Condition of individual equipment, vehicles, weapons and tools
(7) Interest and enthusiasm of personnel.

7. REPORTS: Formal regular training reports are not contemplated. All unit commanders must realize the importance of and develop the habit of immediately reporting all changes of status which affect their unit's operational ability.

8. PUBLICATIONS: Requests for engineer publications will be made in accordance with the policy set forth in Circular 10, Headquarters ETO, dated 16 March 1944. All units and echelons are cautioned to review carefully all requests for publications. The need must be genuine and limited to actual useful requirements. The raiding unit and maintenance of extensive libraries by engineer units is impractical and to be discouraged, particularly inasmuch as large quantities must be "jettisoned" prior to operations. Every effort will be made, however, to furnish pertinent information to interested units. It will be kept in mind that many of the publications which received widespread distribution in the United States are available only in limited quantities in this theater. When publications are pertinent only for infrequent references, the rule will be to borrow it from a higher echelon rather than place an unnecessary strain on critical shipping facilities applicable to publications sent from the United States, or an unwarranted burden on reproduction facilities in this theater.

By command of Lieutenant General PATTON:

R. W. HARTMAN,
Lt. Col., A.G.D.,
Asst. Adj. Gen.

ANNEX NO. 5

HEADQUARTERS
THIRD UNITED STATES ARMY
APO 403

12 June 1944.

PROCUREMENT DIRECTIVE:

NUMBER 41

ACQUISITION OF REAL ESTATE

1. DEFINITION

The term "real estate" as used herein, includes land, buildings, piers, docks and wharves, office and storage space, rights-of-way, or easements, billets, and any interests which may be acquired or held therein, together with such personal property as is taken and used in connection with the real property on which personal property is located.

2. REFERENCES

This Procurement Directive is based upon ETO Procurement Regulations, Headquarters ETO, U.S. Army, AG 600.2 dated 1 April 1944, (ETO SCP No. 10) and ETO Procedure for Acquisition of Real Estate, Headquarters ETO, U.S. Army, AG 600 dated 1 May 1944, (ETO SCP No. 37).

3. BILLETING

a. If a permanent Town Major is stationed in a locality, the Commanding Officer of the troops to be billeted will apply to the Town Major for the location of billets to be occupied. The Town Major will designate billets and will keep the necessary records thereof and make payment therefor.

b. If there is no Town Major in the locality, the Commanding Officer of the troops to be billeted will designate an officer from his command as Acting Town Major. The Acting Town Major will:

(1) Apply to the Mayor for a list of available billets. When the Mayor of acting head of the local government does not supply information, the acting Town Major will take such other steps as may be necessary to obtain such lists.

(2) Assign billets as requested.

(3) Keep a record of billets and of the time occupied.

(4) Once a week, or earlier if the billets are surrendered, prepare a billeting distribution list in triplicate on forms prescribed for this purpose by the Chief Engineer, ETO. An initial supply of these forms will be furnished to units by Army. Additional supply may be obtained by requisition on Army Engineer through normal Engineer channels.

(5) Certify the correctness of the lists, and obtain the stamp or signature of the Mayor attesting their correctness.

(6) If a Purchasing and Contracting Officer is present, have him prepare and certify a local procurement voucher (FD 500 Series) and attach a copy of the billeting distribution list to the original and duplicate of the procurement voucher. The Mayor or local head of government should be paid for all billets. Payment should not be made directly to the inhabitants of a locality except when there is no recognized head of local government acting.

(7) Obtain payment of the local procurement voucher by any authorized disbursing officer in the vicinity, or forward to the Engineer, Third Army, if there is no disbursing officer in the vicinity.

(8) If a Purchasing and Contracting Officer is not present, send the certified billeting distribution lists, in triplicate, to the Engineer, Third Army.

(9) When made available, prescribed billeting rates will be incorporated in subsequent Procurement Directives published by this headquarters.

4. REAL ESTATE

a. Under the provisions of paragraph 4, ETO - SCP No. 37, it is the policy of this command to acquire the use of real estate by requisition or except in the case of real estate owned by an enemy state and real estate in the combat zone which has been vacated on account of existing or imminent combat, which will be seized without formality beyond actual seizure, occupation or use within the limitations prescribed by ETO Procurement Regulations and Procurement Directive No. 3, this headquarters.

b. Commanding Officers desiring the use of real estate will apply therefor to the Town Major or, if there is no Town Major, to the Division, Corps or Army Engineer having authority in the area.

c. Where immediate use of real estate is necessary and there is no Town Major or other engineer representative available, the Commanding Officer of the troops or service concerned may requisition its use, provided such action has first been approved by a General Officer in immediate command of such troops or service in the field or his authorized representative or by higher authority. Where possession is necessary and there is no opportunity for securing approval by a General Officer or his authorized representative, the Commanding Officer

Digitized by Google

concerned may act on his own initiative. In such case he will make immediate report of his action and of the circumstances to the Division, Corps or Army Engineer having authority in the area, or where there is no such Engineer in the area to the Engineer, Third Army, through channels.

d. (1) Requisition receipt, GPA ETO Form No. 6 will be used for requisitioning.

(2) The original of the receipt will be sent to the Engineer, Third Army.

(3) The duplicate of the receipt will be given to the owner.

(4) The triplicate of the receipt will be retained by the requisitioning officer.

e. The requisitioning officer will cause a survey of the premises to be made upon entry thereon, and have the survey signed in duplicate by the owner or his representative, or by the Mayor or other public official, and by the officer making the survey. A copy of the survey will be given the owner or his representative and a copy will be forwarded to the Engineer, Third Army, with the original of the requisition receipt.

f. When the premises are surrendered, a similar inspection of premises will be made and forwarded to the Engineer, Third Army, unless the owner shall in writing acknowledge return of the premises without damage. Such acknowledge, if given, will be forwarded to the Engineer, Third Army.

5. PROCEDURE FOR PURCHASING AND CONTRACTING OFFICERS

It is desired that each headquarters appointing Purchasing and Contracting Officers consolidate reports and records called for in Section VII of SOP No. 37 and forward them to the Engineer, Third Army.

24 June 1944.

PROCUREMENT DIRECTIVE

NUMBER 6

HIRING OF CIVILIAN LABOR

1. DEFINITION.

Civilian labor as used herein will mean any civilian residents of occupied or liberated countries employed by U.S. Forces.

2. POLICY.

a. Local civilian labor will be utilized to the greatest extent possible consistent with security for such tasks as will be appropriate.

b. In the combat zone, under the jurisdiction of Third U.S. Army, civilians will normally be employed on an emergency basis under authority granted in ETO-SOP No. 29 dated 26 May 1944.

3. AUTHORIZATION FOR EMPLOYMENT.

Corps and divisions and all separate units in the Army area are hereby authorized to employ such civilian labor as they require to accomplish their missions. Any questions regarding priority in the hiring of labor will be referred to the Division, Corps or Army Engineer in their respective areas.

4. EMPLOYMENTS--HOW MADE.

Civilians may be procured by any unit from any available source in the area under control of Third U.S. Army. Prospective employees will be offered work at the established rates of pay and told the hours they will be expected to work and other conditions of employment. Those who accept employment under these conditions will be put to work. Those who refuse employment will not be forced to work. No written employment agreement is required. However, should a local employment office be available in the area, all employments will be made through this office, if practicable. Labor will not be procured by contract with a civil agent or labor contractor, or on the basis of a sub-contract, unless specifically authorized by this headquarters. Wages will be paid directly to the individual laborer.

5. HOURS OF SERVICE AND RATES OF PAY.

a. Upon entry into France and until firm official wages are published by this headquarters, it is the responsibility of units procuring and using labor to ascertain from existing local indigenous authorities the local wage rates paid by French (not German) employers immediately prior to entry into the country, and this rate will be the rate paid to all civilian labor in that vicinity. In case it is impracticable to obtain the local wage rates paid by the French immediately prior to our entry into the country, the rates shown in Inclosure #1 will be used.

b. An eight-hour day shall constitute a full day's work and forty-eight hours a full week's work. All time over eight hours in a day or forty-eight hours in a seven-day week shall be considered overtime. Time allowed for meals and time required going to and returning from work shall not be counted as time worked. Recourse to overtime work should be avoided except where considered necessary.

c. Labor may be given one supplementary meal per working day at the place of employment. In establishing basic pay where this meal is given, deduction of 10 francs per meal is to be made. For example, if the wage rate is 8 francs per hour and one meal is furnished, the rate per hour will be reduced to 6.75 francs per hour, so that the worker will be paid 54 francs per eight-hour day, plus one meal.

6. ADMINISTRATION.

a. The officer or non-commissioned officer charged with the supervision of the civilian employees will enter each employee's name in a time book. Any kind of pocket note book may be used for that purpose. A book having columns for names, classifications, rates, dates and total earned is preferable. It is anticipated that each laborer will have his individual work book and identification with him. If so, his correct name will be taken from that record. In many cases the kind of work for which an employee is qualified can be determined from his work book. If requested by the employee, his services with the U.S. Forces should be entered in his work book. In doing this, names or numbers of military units should be omitted for security reasons. The date and hour an employee starts work should be entered on the time book. Employees on the job should be checked at least twice during each shift to see that all are present and working. At the end of each shift, the hours worked by each employee will be entered in the time book opposite the employee's name.

b. At the end of each pay period, which will not exceed two weeks, the hours worked by each employee will be totaled on the time book, multiplied by the rate per hour and the total amount earned entered on the time book. Time books should be retained by the unit or installation as permanent records. Payrolls will be made up from the time books, in quadruplicate, on Standard Form 1013. The hiring unit will retain one copy, one copy will be forwarded to the Army Engineer, and the original and one copy will be presented to the Agent Finance Officer who pays the labor (See par 6c). Except as covered in paragraph 6, below, these will be the only records kept. On the original copy of the payroll the signature of the individual employee will appear the payroll by his mark, which must be witnessed by a commissioned or warrant officer other than the Agent Finance Officer. No advance of pay will be made in any circumstances.

c. Unless other payment arrangements have been made with local Finance Officer, using units will designate an agent officer whose responsibility it will be to procure and disburse funds for the payment of civilian labor. Such agent officers will anticipate their periodic cash needs and draw funds from their parent disbursing officer. Where circumstances are such that the preparation of a payroll for emergency labor is impracticable, the voucher (Local Procurement Voucher FD ETO Form #1) evidencing payment of such emergency labor need not be supported by a payroll, but in lieu thereof the voucher itself will be countersigned and certified correct by an officer or warrant officer who witnessed the payment other than the paying officer. Agent officers will adopt proper means of identifying labor which has been employed under emergency conditions and will file, in support of the voucher, such evidence of employment whenever possible. In the absence of any identification slip bearing the signature of the individual, the officer will state on the voucher the means of identification adopted by him. Similarly, in the case of the payment of other labor, when conditions are such that the signature of all of the laborers cannot be obtained, an officer or warrant officer witnessing the payment, other than the paying officer, may sign the payroll as witness in place of the signature of the laborer. In lieu of the individual signatures on Standard Form 1013, there may be annexed to the payroll improvised receipts of any kind so long as they are signed by the payee or a witnessing officer. Isolated individual payments may be evidenced by individual Local Procurement Vouchers, in which case the agent officer will return to his parent disbursing officer the original and duplicate copies, signed by the employee in the two places marked "X".

7. INJURIES.

a. The word "injury" whenever used below shall mean the disability or death of an employee resulting from personal injuries sustained while in the performance of his duties, but no compensation shall be paid if the injury or death is caused by the wilful misconduct of the employee or by the employee's intention to bring about the injury or death of himself or another, or if intoxication of the injured employee is a proximate cause of the injury or death. Compensation claims will not be denied solely by reason of the fact that the injury or death resulted from enemy action.

b. "Injury Payroll". The term "injury payroll" means a special payroll to be made out in the same manner as the regular civilian employee payrolls on Standard Form 1013. It will only be used in the zone of the Army prior to the establishment of a rear boundary of the Army. Its purpose is to provide compensation for injuries prior to the time claim service is established. It will be plainly marked at the top in all capital letters with the words "INJURY PAYROLL" This injury payroll will be used exclusively for paying civilian employees during the period that they are incapacitated for work by reason of an injury. No individual on it will be paid more than a sum equal to $116.67 per month, nor for a period of beyond 180 days, unless special written instructions are received in the individual's case from Division or higher Headquarters. Compensation rates paid will generally be the rates of the country where the employee was hired, as determined from records of indigenous authorities. In general, the compensation rate should be about 50% of the wage rate.

c. ETO Compensation Form 124, "Report of Injury and Claim for Compensation," is a combination report of an injury claim, medical officer's report, and statement of facts. Requisitions for Form 124 will be sent to Engineer, Headquarters Third U.S. Army. It is to be employed for all injuries sustained by civilian employees. This form will be made out in triplicate and held pending the establishment of the rear boundary of the Army, at which time it will be turned over to the Advance Section or Base Section Claims Officer. Thenceforth, no injury payroll will be used; but all injuries will be reported at once to the Advance Section or Base Section Claims Office on Form 124.

d. In all cases of injuries to civilian employees requiring more than first aid treatment, medical care or hospitalization will be furnished by the commanding officer. Local doctors or hospitals will be utilized when available in preference to Army facilities.

e. Bills for doctors and hospital services incurred as a result of civilian employee's injuries will be forwarded, together with Form 124 covering the case, to the nearest U.S. Claims Service Office. If Form 124 has previously been forwarded, notation to that effect will be made on the bill. Authorization will be granted only to doctors of hospitals for treatment not extending beyond a period of ten days. In a case where treatment is required beyond a period of ten days, it will be necessary for the commanding officer who hired the civilian to give a new authorization for additional treatment. If the commanding officer originally authorizing treatment has moved from the locality where the injured man is being treated, this authorization may be secured from the commanding officer near the locality, to whom the responsibility of the case had been transferred. The employee's commander will continue to discharge his responsibility in regard to an injured employee regardless of his movements, either by carrying on such responsibilities at his new station or by accomplishing the transfer of

Eng
V

Digitized by Google

the necessary record and responsibility to a successive commander near the employee. If Form 174 has been sent to a Base Section Claims Office, the successive commander of the employee receiving the injured employee's case will immediately notify the Base Section Claims Office of the transfer.

f. In all deaths of civilian employees, where the death occurs as a result of injuries on the job, the commanding officer may, when necessary, provide burial. This is applicable where necessity dictates and confers no right or benefit. From 174, Report of Injury, will be made out in all cases of death.

OPERATIONS MEMORANDUM:

NUMBER 21:

FIRE DEFENSE

1. PURPOSE

This directive prescribes the operational fire defense policy within Third United States Army.

2. FIRE DEFENSE

Fire defense consists of the measures required to prevent the destruction by fire of installations, supplies, equipment and communications essential to the operation whether caused by accident, carelessness or enemy action.

3. RESPONSIBILITY

a. Each unit under direct control of Third United States Army will have a definite fire defense plan suitable for instant employment during active overseas operations and will be responsible for fire defense within their areas. Companies or similar units will provide fire watchers and fire guards.

(1) Fire watchers will be posted at convenient locations, so that they can see or hear bombs land. They will be equipped with a whistle and will report all incidents.

(2) Fire guards consisting of three men each, equipped with a stirrup pump (or pump can), two buckets, hand axe and wrecking bar will be provided as required.

b. Corps and Division commanders are responsible for fire defense in their areas.

c. When necessary, assistance to accomplish the mission will be requested from adjacent units, civil fire defense organizations (through Civil Affairs) and from higher echelons.

4. FIRE DEFENSE CONTROL

a. In case of fire, the senior officer or non-commissioned officer present will control all available fire defense measures until arrival of the company commander, fire marshal or fire officer concerned, who will then assume command.

b. Engineer fire fighting sections assigned to the Third United States Army will be under control of this Headquarters (Fire Officer, Engineer Section) and will be employed in fire defense of supply dumps, railheads and communication centers.

5. FIRE REPORTING

a. Any fire which has resulted or may result in affecting the operation will be reported immediately to higher echelons by the most rapid available means, giving unit area, location and brief description and extent of the fire.

b. Reports will be made to the following in order of priority shown:

(1) Engineer, Third United States Army.
(2) PAD Control Center, Third United States Army.

c. All other fires will be reported to the officers indicated in paragraph "b" above. Reports will include the cause of fire and damage in addition to information indicated in paragraph "a" above.

6. EQUIPMENT

Class IV fire fighting equipment will be available at Engineer supply dumps and depots.

7. FIRE REGULATIONS

Fire prevention measures contained in paragraph 11, Fire Regulations, Headquarters ETOUSA dated 15 December 1943, and inclosure No. 1 hereto will be observed.

By command of Lieutenant General PATTON:

OFFICIAL:

HUGH J. GAFFEY,
Major General, U. S. Army,
Chief of Staff.

CONFIDENTIAL

Inclosure [illegible] to Operations Memorandum No. 21, Hq Third U S Army, dated 23 June 1944.

Copy of Annex "A" to Planning Guide, OCE, Hq ETOUSA, 20 Apr 44

FIRE PREVENTION

EXPLOSION:

The issue of clear Fire Prevention Instructions and advice on the siting of camps, dumps and depots from the fire prevention aspect should be considered in all operational fire defense planning.

PETROL REGULATIONS:

1. Shipment of Packaged Petrol. Petrol should always be shipped in vessels designed or converted for the purpose. Where packaged petrol has to be shipped as part of a mixed cargo, the fire hazard is extremely high. Leakage is inevitable, and all possible precautions must be taken to prevent fires and explosions. The storage of petrol with supplies of a combustible nature, must be avoided.

2. Loading and Discharging Petrol. When loading or discharging petrol, fire fighting appliances should be ready for immediate action during the whole period of the operation. "No Smoking" or "Naked Light" regulations on ships and docks must be rigorously enforced.

3. Jettisoning Fuel. Should the jettisoning of fuel become imperative, no lights, fires or other means of ignition should be allowed within a quarter of a mile or more downstream or leeward and 200 to 300 yards to windward, when low flash fuels are jettisoned. Tidal streams and currents should also be taken into consideration. Jettisoning kerosene and diesel oil present no particular fire hazard, provided there is no admixture of vaporising oil.

4. Petrol Carried on Vehicles. Spare cans of petrol should be carried in carriers. Where cans have to be carried within the vehicle, they should be placed so that they can be easily removed should the vehicle or its load catch fire.

5. Filling and Decanting. Carelessness in handling cans when filling petrol tanks must be eliminated. Petrol will not be allowed to spill. Only one can should be opened at a time, the remainder being kept at a safe distance from the filling point. When decanting or draining tanks, each container should be removed to a safe distance from the filling point. When decanting or draining tanks, each container should be removed to a safe distance as soon as it is full.

SITING CAMPS, DUMPS AND DEPOTS.

1. The major problem confronting a Fire Defense Organization, is the supply of sufficient water for fire fighting. Those responsible for the reconnaissance of sites for camps, depots and dumps can ease this problem considerably if the water need is kept in mind.

2. Other conditions permitting, dumps and buildings of a combustible nature should be sited as near available water supply as possible.

3. The importance of dispersal, both of buildings and supply dumps, as a fire prevention measure must always be borne in mind when the selection of a site is being considered.
